Table of Contents

1.1 Introduction

This document covers the Linux Kernel to Userspace API’s used by video and radio streaming devices, including video cameras, analog and digital TV receiver cards, AM/FM receiver cards, Software Defined Radio (SDR), streaming capture and output devices, codec devices and remote controllers.

A typical media device hardware is shown at Typical Media Device.

The media infrastructure API was designed to control such devices. It is divided into five parts.

1. The first part covers radio, video capture and output, cameras, analog TV devices and codecs.
2. The second part covers the API used for digital TV and Internet reception via one of the several digital tv standards. While it is called as DVB API, in fact it covers several different video standards including DVB-T/T2, DVB-S/S2, DVB-C, ATSC, ISDB-T, ISDB-S, DTMB, etc. The complete list of supported standards can be found at fe_delivery_systemtype.
3. The third part covers the Remote Controller API.
4. The fourth part covers the Media Controller API.
5. The fifth part covers the CEC (Consumer Electronics Control) API.

It should also be noted that a media device may also have audio components, like mixers, PCM capture, PCM playback, etc, which are controlled via ALSA API. For additional information and for the latest development code, see: https://linuxtv.org. For discussing improvements, reporting troubles, sending new drivers, etc, please mail to: Linux Media Mailing List (LMML).

1.2 Part I - Video for Linux API

This part describes the Video for Linux API version 2 (V4L2 API) specification.

Revision 4.5

Table of Contents
Fig. 1.1: Typical Media Device

PS.: picture is not complete: other blocks may be present
1.2.1 Common API Elements

Programming a V4L2 device consists of these steps:

- Opening the device
- Changing device properties, selecting a video and audio input, video standard, picture brightness a. o.
- Negotiating a data format
- Negotiating an input/output method
- The actual input/output loop
- Closing the device

In practice most steps are optional and can be executed out of order. It depends on the V4L2 device type, you can read about the details in Interfaces. In this chapter we will discuss the basic concepts applicable to all devices.

Opening and Closing Devices

Device Naming

V4L2 drivers are implemented as kernel modules, loaded manually by the system administrator or automatically when a device is first discovered. The driver modules plug into the “videodev” kernel module. It provides helper functions and a common application interface specified in this document.

Each driver thus loaded registers one or more device nodes with major number 81 and a minor number between 0 and 255. Minor numbers are allocated dynamically unless the kernel is compiled with the kernel option CONFIG_VIDEO_FIXED_MINOR_RANGES. In that case minor numbers are allocated in ranges depending on the device node type (video, radio, etc.).

Many drivers support “video_nr”, “radio_nr” or “vbi_nr” module options to select specific video/radio/vbi node numbers. This allows the user to request that the device node is named e.g. /dev/video5 instead of leaving it to chance. When the driver supports multiple devices of the same type more than one device node number can be assigned, separated by commas:

```
# modprobe mydriver video_nr=0,1 radio_nr=0,1
```

In /etc/modules.conf this may be written as:

```
options mydriver video_nr=0,1 radio_nr=0,1
```

When no device node number is given as module option the driver supplies a default.

Normally udev will create the device nodes in /dev automatically for you. If udev is not installed, then you need to enable the CONFIG_VIDEO_FIXED_MINOR_RANGES kernel option in order to be able to correctly relate a minor number to a device node number. I.e., you need to be certain that minor number 5 maps to device node name video5. With this kernel option different device types have different minor number ranges. These ranges are listed in Interfaces.

The creation of character special files (with mknod) is a privileged operation and devices cannot be opened by major and minor number. That means applications cannot reliable scan for loaded or installed drivers. The user must enter a device name, or the application can try the conventional device names.

Related Devices

Devices can support several functions. For example video capturing, VBI capturing and radio support. The V4L2 API creates different nodes for each of these functions.

1.2. Part I - Video for Linux API
The V4L2 API was designed with the idea that one device node could support all functions. However, in practice this never worked: this ‘feature’ was never used by applications and many drivers did not support it and if they did it was certainly never tested. In addition, switching a device node between different functions only works when using the streaming I/O API, not with the `read()` / `write()` API.

Today each device node supports just one function.

Besides video input or output the hardware may also support audio sampling or playback. If so, these functions are implemented as ALSA PCM devices with optional ALSA audio mixer devices.

One problem with all these devices is that the V4L2 API makes no provisions to find these related devices. Some really complex devices use the Media Controller (see Part IV - Media Controller API) which can be used for this purpose. But most drivers do not use it, and while some code exists that uses sysfs to discover related devices (see `libmedia_dev` in the `v4l-utils` git repository), there is no library yet that can provide a single API towards both Media Controller-based devices and devices that do not use the Media Controller. If you want to work on this please write to the linux-media mailing list: https://linuxtv.org/lists.php.

Multiple Opens

V4L2 devices can be opened more than once. ¹ When this is supported by the driver, users can for example start a “panel” application to change controls like brightness or audio volume, while another application captures video and audio. In other words, panel applications are comparable to an ALSA audio mixer application. Just opening a V4L2 device should not change the state of the device. ²

Once an application has allocated the memory buffers needed for streaming data (by calling the `ioctl VIDIOC_REQBUFS` or `ioctl VIDIOC_CREATE_BUFS` ioctls, or implicitly by calling the `read()` or `write()` functions) that application (filehandle) becomes the owner of the device. It is no longer allowed to make changes that would affect the buffer sizes (e.g. by calling the `VIDIOC_S_FMT` ioctl) and other applications are no longer allowed to allocate buffers or start or stop streaming. The EBUSY error code will be returned instead.

Merely opening a V4L2 device does not grant exclusive access. ³ Initiating data exchange however assigns the right to read or write the requested type of data, and to change related properties, to this file descriptor. Applications can request additional access privileges using the priority mechanism described in Application Priority.

Shared Data Streams

V4L2 drivers should not support multiple applications reading or writing the same data stream on a device by copying buffers, time multiplexing or similar means. This is better handled by a proxy application in user space.

Functions

To open and close V4L2 devices applications use the `open()` and `close()` function, respectively. Devices are programmed using the `ioctl()` function as explained in the following sections.

Querying Capabilities

Because V4L2 covers a wide variety of devices not all aspects of the API are equally applicable to all types of devices. Furthermore devices of the same type have different capabilities and this specification permits

¹ There are still some old and obscure drivers that have not been updated to allow for multiple opens. This implies that for such drivers `open()` can return an EBUSY error code when the device is already in use.

² Unfortunately, opening a radio device often switches the state of the device to radio mode in many drivers. This behavior should be fixed eventually as it violates the V4L2 specification.

³ Drivers could recognize the O_EXCL open flag. Presently this is not required, so applications cannot know if it really works.
the omission of a few complicated and less important parts of the API.

The `ioctl VIDIOC_QUERYCAP` ioctl is available to check if the kernel device is compatible with this specification, and to query the functions and I/O methods supported by the device.

Starting with kernel version 3.1, `ioctl VIDIOC_QUERYCAP` will return the V4L2 API version used by the driver, with generally matches the Kernel version. There’s no need of using `ioctl VIDIOC_QUERYCAP` to check if a specific ioctl is supported, the V4L2 core now returns ENOTTY if a driver doesn’t provide support for an ioctl.

Other features can be queried by calling the respective ioctl, for example `ioctl VIDIOC_ENUMINPUT` to learn about the number, types and names of video connectors on the device. Although abstraction is a major objective of this API, the `ioctl VIDIOC_QUERYCAP` ioctl also allows driver specific applications to reliably identify the driver.

All V4L2 drivers must support `ioctl VIDIOC_QUERYCAP`. Applications should always call this ioctl after opening the device.

**Application Priority**

When multiple applications share a device it may be desirable to assign them different priorities. Contrary to the traditional “rm -rf /” school of thought a video recording application could for example block other applications from changing video controls or switching the current TV channel. Another objective is to permit low priority applications working in background, which can be preempted by user controlled applications and automatically regain control of the device at a later time.

Since these features cannot be implemented entirely in user space V4L2 defines the `VIDIOC_G_PRIORITY` and `VIDIOC_S_PRIORITY` ioctls to request and query the access priority associate with a file descriptor. Opening a device assigns a medium priority, compatible with earlier versions of V4L2 and drivers not supporting these ioctls. Applications requiring a different priority will usually call `VIDIOC_S_PRIORITY` after verifying the device with the `ioctl VIDIOC_QUERYCAP` ioctl.

Ioctl changing driver properties, such as `VIDIOC_S_INPUT`, return an EBUSY error code after another application obtained higher priority.

**Video Inputs and Outputs**

Video inputs and outputs are physical connectors of a device. These can be for example RF connectors (antenna/cable), CVBS a.k.a. Composite Video, S-Video or RGB connectors. Video and VBI capture devices have inputs. Video and VBI output devices have outputs, at least one each. Radio devices have no video inputs or outputs.

To learn about the number and attributes of the available inputs and outputs applications can enumerate them with the `ioctl VIDIOC_ENUMINPUT` and `ioctl VIDIOC_ENUMOUTPUT` ioctl, respectively. The struct `v4l2_input` returned by the `ioctl VIDIOC_ENUMINPUT` ioctl also contains signal :status information applicable when the current video input is queried.

The `VIDIOC_G_INPUT` and `VIDIOC_G_OUTPUT` ioctls return the index of the current video input or output. To select a different input or output applications call the `VIDIOC_S_INPUT` and `VIDIOC_S_OUTPUT` ioctls. Drivers must implement all the input ioctls when the device has one or more inputs, all the output ioctls when the device has one or more outputs.

**Example: Information about the current video input**

```c
struct v4l2_input input;
int index;

if (-1 == ioctl(fd, VIDIOC_G_INPUT, &index)) {
    perror("VIDIOC_G_INPUT");
    exit(EXIT_FAILURE);
```
memset(&input, 0, sizeof(input));
input.index = index;

if (-1 == ioctl(fd, VIDIOC_ENUMINPUT, &input)) {
    perror("VIDIOC_ENUMINPUT");
    exit(EXIT_FAILURE);
}

printf("Current input: %s\n", input.name);

Example: Switching to the first video input

int index;
index = 0;

if (-1 == ioctl(fd, VIDIOC_S_INPUT, &index)) {
    perror("VIDIOC_S_INPUT");
    exit(EXIT_FAILURE);
}

Audio Inputs and Outputs

Audio inputs and outputs are physical connectors of a device. Video capture devices have inputs, output devices have outputs, zero or more each. Radio devices have no audio inputs or outputs. They have exactly one tuner which in fact is an audio source, but this API associates tuners with video inputs or outputs only, and radio devices have none of these. ¹ A connector on a TV card to loop back the received audio signal to a sound card is not considered an audio output.

Audio and video inputs and outputs are associated. Selecting a video source also selects an audio source. This is most evident when the video and audio source is a tuner. Further audio connectors can combine with more than one video input or output. Assumed two composite video inputs and two audio inputs exist, there may be up to four valid combinations. The relation of video and audio connectors is defined in the audioset field of the respective struct v4l2_input or struct v4l2_output, where each bit represents the index number, starting at zero, of one audio input or output.

To learn about the number and attributes of the available inputs and outputs applications can enumerate them with the ioctl VIDIOC_ENUMAUDIO and VIDIOC_ENUMAUDOUT ioctl, respectively. The struct v4l2_audio returned by the ioctl VIDIOC_ENUMAUDIO ioctl also contains signal :status information applicable when the current audio input is queried.

The VIDIOC_G_AUDIO and VIDIOC_G_AUDOUT ioctls report the current audio input and output, respectively.

Note:

Note that, unlike VIDIOC_G_INPUT and VIDIOC_G_OUTPUT these ioctls return a structure as ioctl VIDIOC_ENUMAUDIO and VIDIOC_ENUMAUDOUT do, not just an index.

To select an audio input and change its properties applications call the VIDIOC_S_AUDIO ioctl. To select an audio output (which presently has no changeable properties) applications call the VIDIOC_S_AUDOUT ioctl.

¹ Actually struct v4l2_audio ought to have a tuner field like struct v4l2_input, not only making the API more consistent but also permitting radio devices with multiple tuners.
Drivers must implement all audio input ioctls when the device has multiple selectable audio inputs, all audio output ioctls when the device has multiple selectable audio outputs. When the device has any audio inputs or outputs the driver must set the `V4L2_CAP_AUDIO` flag in the struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl.

**Example: Information about the current audio input**

```c
struct v4l2_audio audio;
memset(&audio, 0, sizeof(audio));
if (-1 == ioctl(fd, VIDIOC_G_AUDIO, &audio)) {
    perror("VIDIOC_G_AUDIO");
    exit(EXIT_FAILURE);
}
printf("Current input: %s\n", audio.name);
```

**Example: Switching to the first audio input**

```c
struct v4l2_audio audio;
memset(&audio, 0, sizeof(audio)); /* clear audio.mode, audio.reserved */
audio.index = 0;
if (-1 == ioctl(fd, VIDIOC_S_AUDIO, &audio)) {
    perror("VIDIOC_S_AUDIO");
    exit(EXIT_FAILURE);
}
```

**Tuners and Modulators**

**Tuners**

Video input devices can have one or more tuners demodulating a RF signal. Each tuner is associated with one or more video inputs, depending on the number of RF connectors on the tuner. The `type` field of the respective struct `v4l2_input` returned by the `ioctl VIDIOC_ENUMINPUT` ioctl is set to `V4L2_INPUT_TYPE_TUNER` and its `tuner` field contains the index number of the tuner.

Radio input devices have exactly one tuner with index zero, no video inputs.

To query and change tuner properties applications use the `VIDIOC_G_TUNER` and `VIDIOC_S_TUNER` ioctls, respectively. The struct `v4l2_tuner` returned by `VIDIOC_G_TUNER` also contains signal status information applicable when the tuner of the current video or radio input is queried.

**Note:**

`VIDIOC_S_TUNER` does not switch the current tuner, when there is more than one at all. The tuner is solely determined by the current video input. Drivers must support both ioctls and set the `V4L2_CAP_TUNER` flag in the struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl when the device has one or more tuners.
Modulators

Video output devices can have one or more modulators, uh, modulating a video signal for radiation or connection to the antenna input of a TV set or video recorder. Each modulator is associated with one or more video outputs, depending on the number of RF connectors on the modulator. The type field of the respective struct `v4l2_output` returned by the `ioctl VIDIOC_ENUMOUTPUT` ioctl is set to `V4L2_OUTPUT_TYPE_MODULATOR` and its modulator field contains the index number of the modulator.

Radio output devices have exactly one modulator with index zero, no video outputs.

A video or radio device cannot support both a tuner and a modulator. Two separate device nodes will have to be used for such hardware, one that supports the tuner functionality and one that supports the modulator functionality. The reason is a limitation with the `VIDIOC_S_FREQUENCY` ioctl where you cannot specify whether the frequency is for a tuner or a modulator.

To query and change modulator properties applications use the `VIDIOC_G_MODULATOR` and `VIDIOC_S_MODULATOR` ioctl. Note that `VIDIOC_S_MODULATOR` does not switch the current modulator, when there is more than one at all. The modulator is solely determined by the current video output. Drivers must support both ioctls and set the `V4L2_CAP_MODULATOR` flag in the struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl when the device has one or more modulators.

Radio Frequency

To get and set the tuner or modulator radio frequency applications use the `VIDIOC_G_FREQUENCY` and `VIDIOC_S_FREQUENCY` ioctl which both take a pointer to a struct `v4l2_frequency`. These ioctls are used for TV and radio devices alike. Drivers must support both ioctls when the tuner or modulator ioctls are supported, or when the device is a radio device.

Video Standards

Video devices typically support one or more different video standards or variations of standards. Each video input and output may support another set of standards. This set is reported by the std field of struct `v4l2_input` and struct `v4l2_output` returned by the `ioctl VIDIOC_ENUMINPUT` and `ioctl VIDIOC_ENUMOUTPUT` ioctls, respectively.

V4L2 defines one bit for each analog video standard currently in use worldwide, and sets aside bits for driver defined standards, e.g. hybrid standards to watch NTSC video tapes on PAL TVs and vice versa. Applications can use the predefined bits to select a particular standard, although presenting the user a menu of supported standards is preferred. To enumerate and query the attributes of the supported standards applications use the `ioctl VIDIOC_ENUMSTD` ioctl.

Many of the defined standards are actually just variations of a few major standards. The hardware may in fact not distinguish between them, or do so internal and switch automatically. Therefore enumerated standards also contain sets of one or more standard bits.

Assume a hypothetic tuner capable of demodulating B/PAL, G/PAL and I/PAL signals. The first enumerated standard is a set of B and G/PAL, switched automatically depending on the selected radio frequency in UHF or VHF band. Enumeration gives a “PAL-B/G” or “PAL-I” choice. Similar a Composite input may collapse standards, enumerating “PAL-B/G/H/I”, “NTSC-M” and “SECAM-D/K”.¹

To query and select the standard used by the current video input or output applications call the `VIDIOC_G_STD` and `VIDIOC_S_STD` ioctl, respectively. The `received` standard can be sensed with the `ioctl VIDIOC_QUERYSTD` ioctl.

¹ Some users are already confused by technical terms PAL, NTSC and SECAM. There is no point asking them to distinguish between B, G, D, or K when the software or hardware can do that automatically.
The parameter of all these ioctl is a pointer to a `v4l2_std_id` type (a standard set), *not* an index into the standard enumeration. Drivers must implement all video standard ioctl when the device has one or more video inputs or outputs.

Special rules apply to devices such as USB cameras where the notion of video standards makes little sense. More generally for any capture or output device which is:

- incapable of capturing fields or frames at the nominal rate of the video standard, or
- that does not support the video standard formats at all.

Here the driver shall set the `std` field of struct `v4l2_input` and struct `v4l2_output` to zero and the `VIDIOC_G_STD`, `VIDIOC_S_STD`, `ioctlVIDIOC_QUERYSTD` and `ioctlVIDIOC_ENUMSTD` ioctl shall return the `ENOTTY` error code or the `EINVAL` error code.

Applications can make use of the `Input capabilities` and `Output capabilities` flags to determine whether the video standard ioctl can be used with the given input or output.

**Example: Information about the current video standard**

```c
v4l2_std_id std_id;
struct v4l2_standard standard;

if (-1 == ioctl(fd, VIDIOC_G_STD, &std_id)) {
    /* Note when VIDIOC_ENUMSTD always returns ENOTTY this
       is no video device or it falls under the USB exception,
       and VIDIOC_G_STD returning ENOTTY is no error. */

    perror("VIDIOC_G_STD");
    exit(EXIT_FAILURE);
}

memset(&standard, 0, sizeof(standard));
standard.index = 0;

while (0 == ioctl(fd, VIDIOC_ENUMSTD, &standard)) {
    if (standard.id & std_id) {
        printf("Current video standard: %s\n", standard.name);
        exit(EXIT_SUCCESS);
    }

    standard.index++;
}
/* EINVAL indicates the end of the enumeration, which cannot be
 empty unless this device falls under the USB exception. */
if (errno == EINVAL || standard.index == 0) {
    perror("VIDIOC_ENUMSTD");
    exit(EXIT_FAILURE);
}
```

**Example: Listing the video standards supported by the current input**

```c
struct v4l2_input input;
struct v4l2_standard standard;
memset(&input, 0, sizeof(input));
```
```c
if (-1 == ioctl(fd, VIDIOC_G_INPUT, &input.index)) {
    perror("VIDIOC_G_INPUT");
    exit(EXIT_FAILURE);
}

if (-1 == ioctl(fd, VIDIOC_ENUMINPUT, &input)) {
    perror("VIDIOC_ENUM_INPUT");
    exit(EXIT_FAILURE);
}

printf("Current input %s supports:\n", input.name);
memset(&standard, 0, sizeof(standard));
standard.index = 0;
while (0 == ioctl(fd, VIDIOC_ENUMSTD, &standard)) {
    if (standard.id & input.std)
        printf("%s\n", standard.name);
    standard.index++;
}
/* EINVAL indicates the end of the enumeration, which cannot be
empty unless this device falls under the USB exception. */
if (errno != EINVAL || standard.index == 0) {
    perror("VIDIOC_ENUMSTD");
    exit(EXIT_FAILURE);
}
```

**Example: Selecting a new video standard**

```c
struct v4l2_input input;
v4l2_std_id std_id;
memset(&input, 0, sizeof(input));

if (-1 == ioctl(fd, VIDIOC_G_INPUT, &input.index)) {
    perror("VIDIOC_G_INPUT");
    exit(EXIT_FAILURE);
}

if (-1 == ioctl(fd, VIDIOC_ENUMINPUT, &input)) {
    perror("VIDIOC_ENUM_INPUT");
    exit(EXIT_FAILURE);
}

if (0 == (input.std & V4L2_STD_PAL_BG)) {
    fprintf(stderr, "Oops. B/G PAL is not supported.\n");
    exit(EXIT_FAILURE);
}
/* Note this is also supposed to work when only B
or G/PAL is supported. */

std_id = V4L2_STD_PAL_BG;
if (-1 == ioctl(fd, VIDIOC_S_STD, &std_id)) {
    perror("VIDIOC_S_STD");
    exit(EXIT_FAILURE);
```
Digital Video (DV) Timings

The video standards discussed so far have been dealing with Analog TV and the corresponding video timings. Today there are many more different hardware interfaces such as High Definition TV interfaces (HDMI), VGA, DVI connectors etc., that carry video signals and there is a need to extend the API to select the video timings for these interfaces. Since it is not possible to extend the `v4l2_std_id` due to the limited bits available, a new set of ioctls was added to set/get video timings at the input and output.

These ioctls deal with the detailed digital video timings that define each video format. This includes parameters such as the active video width and height, signal polarities, frontporches, backporches, sync widths etc. The `linux/v4l2-dv-times.h` header can be used to get the timings of the formats in the CEA-861-E and VESA DMT standards.

To enumerate and query the attributes of the DV timings supported by a device applications use the `ioctl VIDIOC_ENUM_DV_TIMINGS, VIDIOC_SUBDEV_ENUM_DV_TIMINGS` and `ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP` ioctls. To set DV timings for the device applications use the `VIDIOC_S_DV_TIMINGS` ioctl and to get current DV timings they use the `VIDIOC_G_DV_TIMINGS` ioctl. To detect the DV timings as seen by the video receiver applications use the `ioctl VIDIOC_QUERY_DV_TIMINGS` ioctl.

Applications can make use of the `Input capabilities` and `Output capabilities` flags to determine whether the digital video ioctls can be used with the given input or output.

User Controls

Devices typically have a number of user-settable controls such as brightness, saturation and so on, which would be presented to the user on a graphical user interface. But, different devices will have different controls available, and furthermore, the range of possible values, and the default value will vary from device to device. The control ioctls provide the information and a mechanism to create a nice user interface for these controls that will work correctly with any device.

All controls are accessed using an ID value. V4L2 defines several IDs for specific purposes. Drivers can also implement their own custom controls using `V4L2_CID_PRIVATE_BASE` and higher values. The pre-defined control IDs have the prefix `V4L2_CID_`, and are listed in `Control IDs`. The ID is used when querying the attributes of a control, and when getting or setting the current value.

Generally applications should present controls to the user without assumptions about their purpose. Each control comes with a name string the user is supposed to understand. When the purpose is non-intuitive the driver writer should provide a user manual, a user interface plug-in or a driver specific panel application. Predefined IDs were introduced to change a few controls programmatically, for example to mute a device during a channel switch.

Drivers may enumerate different controls after switching the current video input or output, tuner or modulator, or audio input or output. Different in the sense of other bounds, another default and current value, step size or other menu items. A control with a certain custom ID can also change name and type.

If a control is not applicable to the current configuration of the device (for example, it doesn’t apply to the current video input) drivers set the `V4L2_CTRL_FLAG_INACTIVE` flag.

Control values are stored globally, they do not change when switching except to stay within the reported bounds. They also do not change e. g. when the device is opened or closed, when the tuner radio frequency is changed or generally never without application request.

1 The use of `V4L2_CID_PRIVATE_BASE` is problematic because different drivers may use the same `V4L2_CID_PRIVATE_BASE` ID for different controls. This makes it hard to programatically set such controls since the meaning of the control with that ID is driver dependent. In order to resolve this drivers use unique IDs and the `V4L2_CID_PRIVATE_BASE` IDs are mapped to those unique IDs by the kernel. Consider these `V4L2_CID_PRIVATE_BASE` IDs as aliases to the real IDs.

Many applications today still use the `V4L2_CID_PRIVATE_BASE` IDs instead of using `ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU` with the `V4L2_CTRL_FLAG_NEXT_CTRL` flag to enumerate all IDs, so support for `V4L2_CID_PRIVATE_BASE` is still around.
V4L2 specifies an event mechanism to notify applications when controls change value (see `ioctl VIDIOC_SUBSCRIBE_EVENT`, `VIDIOC_UNSUBSCRIBE_EVENT`, event `V4L2_EVENT_CTRL`), panel applications might want to make use of that in order to always reflect the correct control value.

All controls use machine endianness.

**Control IDs**

- **V4L2_CID_BASE**  First predefined ID, equal to V4L2_CID_BRIGHTNESS.
- **V4L2_CID_USER_BASE**  Synonym of V4L2_CID_BASE.
- **V4L2_CID_BRIGHTNESS (integer)**  Picture brightness, or more precisely, the black level.
- **V4L2_CID_CONTRAST (integer)**  Picture contrast or luma gain.
- **V4L2_CID_SATURATION (integer)**  Picture saturation or chroma gain.
- **V4L2_CID_HUE (integer)**  Hue or color balance.
- **V4L2_CID_AUDIO_VOLUME (integer)**  Overall audio volume. Note some drivers also provide an OSS or ALSA mixer interface.
- **V4L2_CID_AUDIO_BALANCE (integer)**  Audio stereo balance. Minimum corresponds to all the way left, maximum to right.
- **V4L2_CID_AUDIO_BASS (integer)**  Audio bass adjustment.
- **V4L2_CID_AUDIO_TREBLE (integer)**  Audio treble adjustment.
- **V4L2_CID_AUDIO_MUTE (boolean)**  Mute audio, i.e. set the volume to zero, however without affecting V4L2_CID_AUDIO_VOLUME. Like ALSA drivers, V4L2 drivers must mute at load time to avoid excessive noise. Actually the entire device should be reset to a low power consumption state.
- **V4L2_CID_AUDIO_LOUDNESS (boolean)**  Loudness mode (bass boost).
- **V4L2_CID_BLACK_LEVEL (integer)**  Another name for brightness (not a synonym of V4L2_CID_BRIGHTNESS). This control is deprecated and should not be used in new drivers and applications.
- **V4L2_CID_AUTO_WHITE_BALANCE (boolean)**  Automatic white balance (cameras).
- **V4L2_CID_DO_WHITE_BALANCE (button)**  This is an action control. When set (the value is ignored), the device will do a white balance and then hold the current setting. Contrast this with the boolean V4L2_CID_AUTO_WHITE_BALANCE, which, when activated, keeps adjusting the white balance.
- **V4L2_CID_RED_BALANCE (integer)**  Red chroma balance.
- **V4L2_CID_BLUE_BALANCE (integer)**  Blue chroma balance.
- **V4L2_CID_GAIN (integer)**  Gain control.
- **V4L2_CID_HFLIP (boolean)**  Mirror the picture horizontally.
- **V4L2_CID_VFLIP (boolean)**  Mirror the picture vertically.
- **V4L2_CID_POWER_LINE_FREQUENCY (enum)**  Enables a power line frequency filter to avoid flicker. Possible values for enum v4l2_power_line_frequency are: `V4L2_CID_POWER_LINE_FREQUENCY_DISABLED` (0), `V4L2_CID_POWER_LINE_FREQUENCY_50HZ` (1), `V4L2_CID_POWER_LINE_FREQUENCY_60HZ` (2) and `V4L2_CID_POWER_LINE_FREQUENCY_AUTO` (3).
V4L2_CID_HUE_AUTO (boolean) Enables automatic hue control by the device. The effect of setting V4L2_CID_HUE while automatic hue control is enabled is undefined, drivers should ignore such request.

V4L2_CID_WHITE_BALANCE_TEMPERATURE (integer) This control specifies the white balance settings as a color temperature in Kelvin. A driver should have a minimum of 2800 (incandescent) to 6500 (daylight). For more information about color temperature see [Wikipedia](#).

V4L2_CID_SHARPNESS (integer) Adjusts the sharpness filters in a camera. The minimum value disables the filters, higher values give a sharper picture.

V4L2_CID_BACKLIGHT_COMPENSATION (integer) Adjusts the backlight compensation in a camera. The minimum value disables backlight compensation.

V4L2_CID_CHROMA_AGC (boolean) Chroma automatic gain control.

V4L2_CID_CHROMA_GAIN (integer) Adjusts the Chroma gain control (for use when chroma AGC is disabled).

V4L2_CID_COLOR_KILLER (boolean) Enable the color killer (i.e. force a black & white image in case of a weak video signal).

V4L2_CID_COLORFX (enum) Selects a color effect. The following values are defined:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_COLORFX_NONE</td>
<td>Color effect is disabled.</td>
</tr>
<tr>
<td>V4L2_COLORFX_ANTIQUE</td>
<td>An aging (old photo) effect.</td>
</tr>
<tr>
<td>V4L2_COLORFX_ART_FREEZE</td>
<td>Frost color effect.</td>
</tr>
<tr>
<td>V4L2_COLORFX_AQUA</td>
<td>Water color, cool tone.</td>
</tr>
<tr>
<td>V4L2_COLORFX_BW</td>
<td>Black and white.</td>
</tr>
<tr>
<td>V4L2_COLORFX_EMBoss</td>
<td>Emboss, the highlights and shadows replace light/dark boundaries and low contrast areas are set to a gray background.</td>
</tr>
<tr>
<td>V4L2_COLORFX_GRASS_GREEN</td>
<td>Grass green.</td>
</tr>
<tr>
<td>V4L2_COLORFX_NEGATIVE</td>
<td>Negative.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SEPIA</td>
<td>Sepia tone.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SKETCH</td>
<td>Sketch.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SKIN_WHITEN</td>
<td>Skin whiten.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SKY_BLUE</td>
<td>Sky blue.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SOLARIZATION</td>
<td>Solarization, the image is partially reversed in tone, only color values above or below a certain threshold are inverted.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SILHOUETTE</td>
<td>Silhouette (outline).</td>
</tr>
<tr>
<td>V4L2_COLORFX_VIVID</td>
<td>Vivid colors.</td>
</tr>
<tr>
<td>V4L2_COLORFX_SET_CBCR</td>
<td>The Cb and Cr chroma components are replaced by fixed coefficients determined by V4L2_CID_COLORFX_CBCR control.</td>
</tr>
</tbody>
</table>

V4L2_CID_COLORFX_CBCR (integer) Determines the Cb and Cr coefficients for V4L2_COLORFX_SET_CBCR color effect. Bits [7:0] of the supplied 32 bit value are interpreted as Cr component, bits [15:8] as Cb component and bits [31:16] must be zero.

V4L2_CID_AUTOBRIGHTNESS (boolean) Enable Automatic Brightness.

V4L2_CID_ROTATE (integer) Rotates the image by specified angle. Common angles are 90, 270 and 180. Rotating the image to 90 and 270 will reverse the height and width of the display window. It is necessary to set the new height and width of the picture using the VIDIOC_S_FMT ioctl according to the rotation angle selected.

V4L2_CID_BG_COLOR (integer) Sets the background color on the current output device. Background color needs to be specified in the RGB24 format. The supplied 32 bit value is interpreted as bits 0-7 Red color information, bits 8-15 Green color information, bits 16-23 Blue color information and bits 24-31 must be zero.

V4L2_CID_ILLUMINATORS_1 V4L2_CID_ILLUMINATORS_2 (boolean) Switch on or off the illuminator 1 or 2 of the device (usually a microscope).
V4L2_CID_MIN_BUFFERS_FOR_CAPTURE (integer)  This is a read-only control that can be read by the application and used as a hint to determine the number of CAPTURE buffers to pass to REQBUFS. The value is the minimum number of CAPTURE buffers that is necessary for hardware to work.

V4L2_CID_MIN_BUFFERS_FOR_OUTPUT (integer)  This is a read-only control that can be read by the application and used as a hint to determine the number of OUTPUT buffers to pass to REQBUFS. The value is the minimum number of OUTPUT buffers that is necessary for hardware to work.

V4L2_CID_ALPHA_COMPONENT (integer)  Sets the alpha color component. When a capture device (or capture queue of a mem-to-mem device) produces a frame format that includes an alpha component (e.g. packed RGB image formats) and the alpha value is not defined by the device or the mem-to-mem input data this control lets you select the alpha component value of all pixels. When an output device (or output queue of a mem-to-mem device) consumes a frame format that doesn’t include an alpha component and the device supports alpha channel processing this control lets you set the alpha component value of all pixels for further processing in the device.

V4L2_CID_LASTP1  End of the predefined control IDs (currently V4L2_CID_ALPHA_COMPONENT + 1).

V4L2_CID_PRIVATE_BASE  ID of the first custom (driver specific) control. Applications depending on particular custom controls should check the driver name and version, see Querying Capabilities.

Applications can enumerate the available controls with the ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU and VIDIOC_QUERYMENU ioctls, get and set a control value with the VIDIOC_G_CTRL and VIDIOC_S_CTRL ioctls. Drivers must implement VIDIOC_QUERYCTRL, VIDIOC_G_CTRL and VIDIOC_S_CTRL when the device has one or more controls, VIDIOC_QUERYMENU when it has one or more menu type controls.

Example: Enumerating all user controls

```c
struct v4l2_queryctrl queryctrl;
struct v4l2_querymenu querymenu;

static void enumerate_menu(void)
{
    printf( " Menu items:\n" );

    memset(&querymenu, 0, sizeof(querymenu));
    querymenu.id = queryctrl.id;

    for (querymenu.index = queryctrl.minimum;
         querymenu.index <= queryctrl.maximum;
         querymenu.index++) {
        if (0 == ioctl(fd, VIDIOC_QUERYMENU, &querymenu)) {
            printf(" %s\n", querymenu.name);
        }
    }

    memset(&queryctrl, 0, sizeof(queryctrl));

    for (queryctrl.id = V4L2_CID_BASE;
         queryctrl.id < V4L2_CID_LASTP1;
         queryctrl.id++) {
        if (0 == ioctl(fd, VIDIOC_QUERYCTRL, &queryctrl)) {
            if (queryctrl.flags & V4L2_CTRL_FLAG_DISABLED)
                continue;
            printf("Control %s\n", queryctrl.name);
            if (queryctrl.type == V4L2_CTRL_TYPE_MENU)
                enumerate_menu();
        } else {
```
```c
if (errno == EINVAL)
    continue;

perror("VIDIOC_QUERYCTRL");
exit(EXIT_FAILURE);
}
}
for (queryctrl.id = V4L2_CID_PRIVATE_BASE;;
    queryctrl.id++) {
    if (0 == ioctl(fd, VIDIOC_QUERYCTRL, &queryctrl)) {
        if (queryctrl.flags & V4L2_CTRL_FLAG_DISABLED)
            continue;

        printf("Control %s\n", queryctrl.name);

        if (queryctrl.type == V4L2_CTRL_TYPE_MENU)
            enumerate_menu();
    } else {
        if (errno == EINVAL)
            break;

        perror("VIDIOC_QUERYCTRL");
        exit(EXIT_FAILURE);
    }
}
```

**Example: Enumerating all user controls (alternative)**

```c
memset(&queryctrl, 0, sizeof(queryctrl));

queryctrl.id = V4L2_CTRL_CLASS_USER | V4L2_CTRL_FLAG_NEXT_CTRL;
while (0 == ioctl(fd, VIDIOC_QUERYCTRL, &queryctrl)) {
    if (V4L2_CTRL_ID2CLASS(queryctrl.id) != V4L2_CTRL_CLASS_USER)
        break;
    if (queryctrl.flags & V4L2_CTRL_FLAG_DISABLED)
        continue;

    printf("Control %s\n", queryctrl.name);

    if (queryctrl.type == V4L2_CTRL_TYPE_MENU)
        enumerate_menu();

    queryctrl.id |= V4L2_CTRL_FLAG_NEXT_CTRL;
}
if (errno != EINVAL) {
    perror("VIDIOC_QUERYCTRL");
    exit(EXIT_FAILURE);
}
```

**Example: Changing controls**

```c
struct v4l2_queryctrl queryctrl;
struct v4l2_control control;
memset(&queryctrl, 0, sizeof(queryctrl));
queryctrl.id = V4L2_CID_BRIGHTNESS;
```
if (-1 == ioctl(fd, VIDIOC_QUERYCTRL, &queryctrl)) {
    if (errno != EINVAL) {
        perror("VIDIOC_QUERYCTRL");
        exit(EXIT_FAILURE);
    } else {
        printf("V4L2_CID_BRIGHTNESS is not supported\n");
    }
} else if (queryctrl.flags & V4L2_CTRL_FLAG_DISABLED) {
    printf("V4L2_CID_BRIGHTNESS is not supported\n");
} else {
    memset(&control, 0, sizeof (control));
    control.id = V4L2_CID_BRIGHTNESS;
    control.value = queryctrl.default_value;

    if (-1 == ioctl(fd, VIDIOC_S_CTRL, &control)) {
        perror("VIDIOC_S_CTRL");
        exit(EXIT_FAILURE);
    }
}

memset(&control, 0, sizeof(control));
control.id = V4L2_CID_CONTRAST;

if (0 == ioctl(fd, VIDIOC_G_CTRL, &control)) {
    control.value += 1;
    /* The driver may clamp the value or return ERANGE, ignored here */

    if (-1 == ioctl(fd, VIDIOC_S_CTRL, &control)
&& errno != ERANGE) {
        perror("VIDIOC_S_CTRL");
        exit(EXIT_FAILURE);
    }
    /* Ignore if V4L2_CID_CONTRAST is unsupported */
} else if (errno != EINVAL) {
    perror("VIDIOC_G_CTRL");
    exit(EXIT_FAILURE);
}

control.id = V4L2_CID_AUDIO_MUTE;
control.value = 1; /* silence */

/* Errors ignored */
ioctl(fd, VIDIOC_S_CTRL, &control);

Extended Controls

Introduction

The control mechanism as originally designed was meant to be used for user settings (brightness, saturation, etc). However, it turned out to be a very useful model for implementing more complicated driver APIs where each driver implements only a subset of a larger API.

The MPEG encoding API was the driving force behind designing and implementing this extended control mechanism: the MPEG standard is quite large and the currently supported hardware MPEG encoders each only implement a subset of this standard. Further more, many parameters relating to how the video is encoded into an MPEG stream are specific to the MPEG encoding chip since the MPEG standard only defines the format of the resulting MPEG stream, not how the video is actually encoded into that format.

Unfortunately, the original control API lacked some features needed for these new uses and so it was extended into the (not terribly originally named) extended control API.
Even though the MPEG encoding API was the first effort to use the Extended Control API, nowadays there are also other classes of Extended Controls, such as Camera Controls and FM Transmitter Controls. The Extended Controls API as well as all Extended Controls classes are described in the following text.

The Extended Control API

Three new ioctls are available: `VIDIOC_G_EXT_CTRLS` , `VIDIOC_S_EXT_CTRLS` and `VIDIOC_TRY_EXT_CTRLS` . These ioctls act on arrays of controls (as opposed to the `VIDIOC_G_CTRL` and `VIDIOC_S_CTRL` ioctls that act on a single control). This is needed since it is often required to atomically change several controls at once.

Each of the new ioctls expects a pointer to a struct `v4l2_ext_controls` . This structure contains a pointer to the control array, a count of the number of controls in that array and a control class. Control classes are used to group similar controls into a single class. For example, control class `V4L2_CTRL_CLASS_USER` contains all user controls (i.e. all controls that can also be set using the old `VIDIOC_S_CTRL` ioctl). Control class `V4L2_CTRL_CLASS_MPEG` contains all controls relating to MPEG encoding, etc.

All controls in the control array must belong to the specified control class. An error is returned if this is not the case.

It is also possible to use an empty control array (`count == 0`) to check whether the specified control class is supported.

The control array is a struct `v4l2_ext_control` array. The `struct v4l2_ext_control` structure is very similar to `struct v4l2_control` , except for the fact that it also allows for 64-bit values and pointers to be passed.

Since the struct `v4l2_ext_control` supports pointers it is now also possible to have controls with compound types such as N-dimensional arrays and/or structures. You need to specify the `V4L2_CTRL_FLAG_NEXT_COMPOUND` when enumerating controls to actually be able to see such compound controls. In other words, these controls with compound types should only be used programmatically.

Since such compound controls need to expose more information about themselves than is possible with `ioctl` `VIDIOC_QUERYCTRL`, `VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` the `VIDIOC_QUERY_EXT_CTRL` ioctl was added. In particular, this ioctl gives the dimensions of the N-dimensional array if this control consists of more than one element.

Note:

1. It is important to realize that due to the flexibility of controls it is necessary to check whether the control you want to set actually is supported in the driver and what the valid range of values is. So use the `ioctl` `VIDIOC_QUERYCTRL`, `VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` (or `VIDIOC_QUERY_EXT_CTRL`) and `VIDIOC_QUERYMENU` `ioctl` to check this.

2. It is possible that some of the menu indices in a control of type `V4L2_CTRL_TYPE_MENU` may not be supported (`VIDIOC_QUERYMENU` will return an error). A good example is the list of supported MPEG audio bitrates. Some drivers only support one or two bitrates, others support a wider range.

All controls use machine endianness.

Enumerating Extended Controls

The recommended way to enumerate over the extended controls is by using `ioctl` `VIDIOC_QUERYCTRL`, `VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` in combination with the `V4L2_CTRL_FLAG_NEXT_CTRL` flag:

```c
struct v4l2_queryctrl qctrl;
qctrl.id = V4L2_CTRL_FLAG_NEXT_CTRL;
while (0 == ioctl(fd, VIDIOC_QUERYCTRL, &qctrl)) {
```

1.2. Part I - Video for Linux API

19
The initial control ID is set to 0 ORed with the `V4L2_CTRL_FLAG_NEXT_CTRL` flag. The `VIDIOC_QUERYCTRL` ioctl will return the first control with a higher ID than the specified one. When no such controls are found an error is returned.

If you want to get all controls within a specific control class, then you can set the initial `qctrl.id` value to the control class and add an extra check to break out of the loop when a control of another control class is found:

```c
qctrl.id = V4L2_CTRL_CLASS_MPEG | V4L2_CTRL_FLAG_NEXT_CTRL;
while (0 == ioctl(fd, VIDIOC_QUERYCTRL, &qctrl)) {
    if (V4L2_CTRL_ID2CLASS(qctrl.id) != V4L2_CTRL_CLASS_MPEG)
        break;
    /* ... */
    qctrl.id |= V4L2_CTRL_FLAG_NEXT_CTRL;
}
```

The 32-bit `qctrl.id` value is subdivided into three bit ranges: the top 4 bits are reserved for flags (e.g. `V4L2_CTRL_FLAG_NEXT_CTRL`) and are not actually part of the ID. The remaining 28 bits form the control ID, of which the most significant 12 bits define the control class and the least significant 16 bits identify the control within the control class. It is guaranteed that these last 16 bits are always non-zero for controls. The range of 0x1000 and up are reserved for driver-specific controls. The macro `V4L2_CTRL_ID2CLASS(id)` returns the control class ID based on a control ID.

If the driver does not support extended controls, then `VIDIOC_QUERYCTRL` will fail when used in combination with `V4L2_CTRL_FLAG_NEXT_CTRL`. In that case the old method of enumerating control should be used (see Example: Enumerating all user controls). But if it is supported, then it is guaranteed to enumerate over all controls, including driver-private controls.

## Creating Control Panels

It is possible to create control panels for a graphical user interface where the user can select the various controls. Basically you will have to iterate over all controls using the method described above. Each control class starts with a control of type `V4L2_CTRL_TYPE_CTRL_CLASS`. `VIDIOC_QUERYCTRL` will return the name of this control class which can be used as the title of a tab page within a control panel.

The flags field of struct `v4l2_queryctrl` also contains hints on the behavior of the control. See the `ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU` documentation for more details.

## Codec Control Reference

Below all controls within the Codec control class are described. First the generic controls, then controls specific for certain hardware.

**Note:**

These controls are applicable to all codecs and not just MPEG. The defines are prefixed with `V4L2_CID_MPEG/V4L2_MPEG` as the controls were originally made for MPEG codecs and later extended to cover all encoding formats.
Generic Codec Controls

Codec Control IDs

**V4L2_CID_MPEG_CLASS** (class) The Codec class descriptor. Calling `ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` for this control will return a description of this control class. This description can be used as the caption of a Tab page in a GUI, for example.

**V4L2_CID_MPEG_STREAM_TYPE** (enum)

enum v4l2_mpeg_stream_type - The MPEG-1, -2 or -4 output stream type. One cannot assume anything here. Each hardware MPEG encoder tends to support different subsets of the available MPEG stream types. This control is specific to multiplexed MPEG streams. The currently defined stream types are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_STREAM_TYPE_MPEG2_PS</td>
<td>MPEG-2 program stream</td>
</tr>
<tr>
<td>V4L2_MPEG_STREAM_TYPE_MPEG2_TS</td>
<td>MPEG-2 transport stream</td>
</tr>
<tr>
<td>V4L2_MPEG_STREAM_TYPE_MPEG1_SS</td>
<td>MPEG-1 system stream</td>
</tr>
<tr>
<td>V4L2_MPEG_STREAM_TYPE_MPEG2_DVD</td>
<td>MPEG-2 DVD-compatible stream</td>
</tr>
<tr>
<td>V4L2_MPEG_STREAM_TYPE_MPEG1_VCD</td>
<td>MPEG-1 VCD-compatible stream</td>
</tr>
<tr>
<td>V4L2_MPEG_STREAM_TYPE_MPEG2_SVCD</td>
<td>MPEG-2 SVCD-compatible stream</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_STREAM_PID_PMT** (integer) Program Map Table Packet ID for the MPEG transport stream (default 16)

**V4L2_CID_MPEG_STREAM_PID_AUDIO** (integer) Audio Packet ID for the MPEG transport stream (default 256)

**V4L2_CID_MPEG_STREAM_PID_VIDEO** (integer) Video Packet ID for the MPEG transport stream (default 260)

**V4L2_CID_MPEG_STREAM_PID_PCR** (integer) Packet ID for the MPEG transport stream carrying PCR fields (default 259)

**V4L2_CID_MPEG_STREAM_PES_ID_AUDIO** (integer) Audio ID for MPEG PES

**V4L2_CID_MPEG_STREAM_PES_ID_VIDEO** (integer) Video ID for MPEG PES

**V4L2_CID_MPEG_STREAM_VBI_FMT** (enum)

enum v4l2_mpeg_stream_vbi_fmt - Some cards can embed VBI data (e.g. Closed Caption, Teletext) into the MPEG stream. This control selects whether VBI data should be embedded, and if so, what embedding method should be used. The list of possible VBI formats depends on the driver. The currently defined VBI format types are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_STREAM_VBI_FMT_NONE</td>
<td>No VBI in the MPEG stream</td>
</tr>
<tr>
<td>V4L2_MPEG_STREAM_VBI_FMT_IVTV</td>
<td>VBI in private packets, IVTV format (documented in the kernel sources in the file Documentation/video4linux/cx2341x/README.vbi)</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_AUDIO_SAMPLING_FREQ** (enum)

enum v4l2_mpeg_audio_sampling_freq - MPEG Audio sampling frequency. Possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_AUDIO_SAMPLING_FREQ_44100</td>
<td>44.1 kHz</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_SAMPLING_FREQ_48000</td>
<td>48 kHz</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_SAMPLING_FREQ_32000</td>
<td>32 kHz</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_AUDIO_ENCODING** (enum)

enum v4l2_mpeg_audio_encoding - MPEG Audio encoding. This control is specific to multiplexed MPEG streams. Possible values are:
### V4L2_MPEG_AUDIO_ENCODING_LAYER_1
MPEG-1/2 Layer I encoding

<table>
<thead>
<tr>
<th>Enum</th>
<th>Bits per second</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_AUDIO_L1_BITRATE_32K</td>
<td>32 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L1_BITRATE_64K</td>
<td>64 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L1_BITRATE_96K</td>
<td>96 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L1_BITRATE_128K</td>
<td>128 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L1_BITRATE_160K</td>
<td>160 kbit/s</td>

<td>384 kbit/s</td>
</tr>
</tbody>
</table>

### V4L2_MPEG_AUDIO_L2_BITRATE (enum)

**enum v4l2_mpeg_audio_l2_bitrate** - MPEG-1/2 Layer II bitrate. Possible values are:

<table>
<thead>
<tr>
<th>Enum</th>
<th>Bits per second</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_32K</td>
<td>32 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_48K</td>
<td>48 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_56K</td>
<td>56 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_64K</td>
<td>64 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_80K</td>
<td>80 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_96K</td>
<td>96 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_112K</td>
<td>112 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_128K</td>
<td>128 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_160K</td>
<td>160 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_192K</td>
<td>192 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_224K</td>
<td>224 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_256K</td>
<td>256 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_320K</td>
<td>320 kbit/s</td>
</tr>
<tr>
<td>V4L2_MPEG_AUDIO_L2_BITRATE_384K</td>
<td>384 kbit/s</td>
</tr>
</tbody>
</table>

### V4L2_MPEG_AUDIO_L3_BITRATE (enum)

**enum v4l2_mpeg_audio_l3_bitrate** - MPEG-1/2 Layer III bitrate. Possible values are:
**V4L2_MPEG_AUDIO_L3_BITRATE_32K** 32 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_40K** 40 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_48K** 48 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_56K** 56 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_64K** 64 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_80K** 80 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_96K** 96 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_112K** 112 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_128K** 128 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_160K** 160 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_192K** 192 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_224K** 224 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_256K** 256 kbit/s
**V4L2_MPEG_AUDIO_L3_BITRATE_320K** 320 kbit/s

**V4L2_MPEG_AUDIO_L3_BITRATE (integer)** AAC bitrate in bits per second.

**V4L2_CID_MPEG_AUDIO_AAC_BITRATE (integer)** AAC bitrate in bits per second. Possible values are:

**enum v4l2_mpeg_audio_ac3_bitrate** - AC-3 bitrate. Possible values are:

</table>

**V4L2_CID_MPEG_AUDIO_MODE (enum)** MPEG Audio mode. Possible values are:

| V4L2_MPEG_AUDIO_MODE_STEREO | Stereo |
| V4L2_MPEG_AUDIO_MODE_JOINT_STEREO | Joint Stereo |
| V4L2_MPEG_AUDIO_MODE_DUAL | Bilingual |
| V4L2_MPEG_AUDIO_MODE_MONO | Mono |

**V4L2_CID_MPEG_AUDIO_MODE_EXTENSION (enum)** Joint Stereo audio mode extension. In Layer I and II they indicate which subbands are in intensity stereo. All other subbands are coded in stereo. Layer III is not (yet) supported. Possible values are:

| V4L2_MPEG_AUDIO_MODE_EXTENSION_BOUND_4 | Subbands 4-31 in intensity stereo |
| V4L2_MPEG_AUDIO_MODE_EXTENSION_BOUND_8 | Subbands 8-31 in intensity stereo |
| V4L2_MPEG_AUDIO_MODE_EXTENSION_BOUND_12 | Subbands 12-31 in intensity stereo |
| V4L2_MPEG_AUDIO_MODE_EXTENSION_BOUND_16 | Subbands 16-31 in intensity stereo |

**V4L2_CID_MPEG_AUDIO_EMPHASIS (enum)**
enum v4l2_mpeg_audio_emphasis - Audio Emphasis. Possible values are:

| V4L2_MPEG_AUDIO_EMPHASIS_NONE | None                        |
| V4L2_MPEG_AUDIO_EMPHASIS_50_DIV_15_uS | 50/15 microsecond emphasis |
| V4L2_MPEG_AUDIO_EMPHASIS_CCITT_J17 | CCITT J17                  |

V4L2_CID_MPEG_AUDIO_CRC (enum)

enum v4l2_mpeg_audio_crc - CRC method. Possible values are:

| V4L2_MPEG_AUDIO_CRC_NONE | None          |
| V4L2_MPEG_AUDIO_CRC_CRC16 | 16 bit parity check |

V4L2_CID_MPEG_AUDIO_MUTE (boolean) Mutes the audio when capturing. This is not done by muting audio hardware, which can still produce a slight hiss, but in the encoder itself, guaranteeing a fixed and reproducible audio bitstream. 0 = unmuted, 1 = muted.

V4L2_CID_MPEG_AUDIO_DEC_PLAYBACK (enum)

enum v4l2_mpeg_audio_dec_playback - Determines how monolingual audio should be played back. Possible values are:

| V4L2_MPEG_AUDIO_DEC_PLAYBACK_AUTO | Automatically determines the best playback mode. |
| V4L2_MPEG_AUDIO_DEC_PLAYBACK_STEREO | Stereo playback. |
| V4L2_MPEG_AUDIO_DEC_PLAYBACK_LEFT | Left channel playback. |
| V4L2_MPEG_AUDIO_DEC_PLAYBACK_RIGHT | Right channel playback. |
| V4L2_MPEG_AUDIO_DEC_PLAYBACK_MONO | Mono playback. |
| V4L2_MPEG_AUDIO_DEC_PLAYBACK_SWAPPED_STEREO | Stereo playback with swapped left and right channels. |

V4L2_CID_MPEG_AUDIO_DEC_MULTILINGUAL_PLAYBACK (enum)

enum v4l2_mpeg_audio_dec_playback - Determines how multilingual audio should be played back.

V4L2_CID_MPEG_VIDEO_ENCODING (enum)

enum v4l2_mpeg_video_encoding - MPEG Video encoding method. This control is specific to multiplexed MPEG streams. Possible values are:

| V4L2_MPEG_VIDEO_ENCODING_MPEG_1 | MPEG-1 Video encoding |
| V4L2_MPEG_VIDEO_ENCODING_MPEG_2 | MPEG-2 Video encoding |
| V4L2_MPEG_VIDEO_ENCODING_MPEG_4_AVC | MPEG-4 AVC (H.264) Video encoding |

V4L2_CID_MPEG_VIDEO_ASPECT (enum)

enum v4l2_mpeg_video_aspect - Video aspect. Possible values are:

| V4L2_MPEG_VIDEO_ASPECT_1x1 |
| V4L2_MPEG_VIDEO_ASPECT_4x3 |
| V4L2_MPEG_VIDEO_ASPECT_16x9 |
| V4L2_MPEG_VIDEO_ASPECT_221x100 |

V4L2_CID_MPEG_VIDEO_B_FRAMES (integer) Number of B-Frames (default 2)

V4L2_CID_MPEG_VIDEO_GOP_SIZE (integer) GOP size (default 12)

V4L2_CID_MPEG_VIDEO_GOP_CLOSURE (boolean) GOP closure (default 1)

V4L2_CID_MPEG_VIDEO_PULLDOWN (boolean) Enable 3:2 pulldown (default 0)

V4L2_CID_MPEG_VIDEO_BITRATE_MODE (enum)

enum v4l2_mpeg_video_bitrate_mode - Video bitrate mode. Possible values are:

| V4L2_MPEG_VIDEO_BITRATE_MODE_VBR | Variable bitrate |
| V4L2_MPEG_VIDEO_BITRATE_MODE_CBR | Constant bitrate |

V4L2_CID_MPEG_VIDEO_BITRATE (integer) Video bitrate in bits per second.
V4L2_CID_MPEG_VIDEO_BITRATE_PEAK (integer) Peak video bitrate in bits per second. Must be larger or equal to the average video bitrate. It is ignored if the video bitrate mode is set to constant bitrate.

V4L2_CID_MPEG_VIDEO_TEMPORAL_DECIMATION (integer) For every captured frame, skip this many subsequent frames (default 0).

V4L2_CID_MPEG_VIDEO_MUTE (boolean) “Mutes” the video to a fixed color when capturing. This is useful for testing, to produce a fixed video bitstream. 0 = unmuted, 1 = muted.

V4L2_CID_MPEG_VIDEO_MUTE_YUV (integer) Sets the “mute” color of the video. The supplied 32-bit integer is interpreted as follows (bit 0 = least significant bit):

| Bit 0:7 | V chrominance information |
| Bit 8:15 | U chrominance information |
| Bit 16:23 | Y luminance information |
| Bit 24:31 | Must be zero. |

V4L2_CID_MPEG_VIDEO_DEC_PTS (integer64) This read-only control returns the 33-bit video Presentation Time Stamp as defined in ITU T-REC-H.222.0 and ISO/IEC 13818-1 of the currently displayed frame. This is the same PTS as is used in ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD.

V4L2_CID_MPEG_VIDEO_DEC_FRAME (integer64) This read-only control returns the frame counter of the frame that is currently displayed (decoded). This value is reset to O whenever the decoder is started.

V4L2_CID_MPEG_VIDEO_DECODER_SLICE_INTERFACE (boolean) If enabled the decoder expects to receive a single slice per buffer, otherwise the decoder expects a single frame in per buffer. Applicable to the decoder, all codecs.

V4L2_CID_MPEG_VIDEO_H264_VUI_SAR_ENABLE (boolean) Enable writing sample aspect ratio in the Video Usability Information. Applicable to the H264 encoder.

V4L2_CID_MPEG_VIDEO_H264_VUI_SAR_IDC (enum)

#### V4L2_CID_MPEG_VIDEO_MAX_REF_PIC (integer)

The maximum number of reference pictures used for encoding. Applicable to the encoder.

#### V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MODE (enum)

**enum v4l2_mpeg_video_multi_slice_mode** - Determines how the encoder should handle division of frame into slices. Applicable to the encoder. Possible values are:

- V4L2_MPEG_VIDEO_MULTI_SLICE_MODE_SINGLE  - Single slice per frame.
- V4L2_MPEG_VIDEO_MULTI_SLICE_MODE_MAX_MB  - Multiple slices with set maximum number of macroblocks per slice.
- V4L2_MPEG_VIDEO_MULTI_SLICE_MODE_MAX_BYTES - Multiple slice with set maximum size in bytes per slice.

#### V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MAX_MB (integer)

The maximum number of macroblocks in a slice. Used when V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MODE is set to V4L2_MPEG_VIDEO_MULTI_SLICE_MODE_MAX_MB. Applicable to the encoder.

#### V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MAX_BYTES (integer)

The maximum size of a slice in bytes. Used when V4L2_CID_MPEG_VIDEO_MULTI_SLICE_MODE is set to V4L2_MPEG_VIDEO_MULTI_SLICE_MODE_MAX_BYTES. Applicable to the encoder.

#### V4L2_CID_MPEG_VIDEO_H264_LOOP_FILTER_MODE (enum)

**enum v4l2_mpeg_video_h264_loop_filter_mode** - Loop filter mode for H264 encoder. Possible values are:

- V4L2_MPEG_VIDEO_H264_LOOP_FILTER_MODE_ENABLED - Loop filter is enabled.
- V4L2_MPEG_VIDEO_H264_LOOP_FILTER_MODE_DISABLED - Loop filter is disabled.
- V4L2_MPEG_VIDEO_H264_LOOP_FILTER_MODE_DISABLED_AT_SLICE_BOUNDARY - Loop filter is disabled at the slice boundary.

#### V4L2_CID_MPEG_VIDEO_H264_LOOP_FILTER_ALPHA (integer)

Loop filter alpha coefficient, defined in the H264 standard. Applicable to the H264 encoder.

#### V4L2_CID_MPEG_VIDEO_H264_LOOP_FILTER_BETA (integer)

Loop filter beta coefficient, defined in the H264 standard. Applicable to the H264 encoder.

#### V4L2_CID_MPEG_VIDEO_H264_ENTROPY_MODE (enum)

**enum v4l2_mpeg_video_h264_entropy_mode** - Entropy coding mode for H264 - CABAC/CAVLCL. Applicable to the H264 encoder. Possible values are:

- V4L2_MPEG_VIDEO_H264_ENTROPY_MODE_CAVLC - Use CAVLC entropy coding.
- V4L2_MPEG_VIDEO_H264_ENTROPY_MODE_CABAC - Use CABAC entropy coding.

#### V4L2_CID_MPEG_VIDEO_H264_8X8_TRANSFORM (boolean)

Enable 8X8 transform for H264. Applicable to the H264 encoder.

#### V4L2_CID_MPEG_VIDEO_CYCLIC_INTRA_REFRESH_MB (integer)

Cyclic intra macroblock refresh. This is the number of continuous macroblocks refreshed every frame. Each frame a successive set of macroblocks is refreshed until the cycle completes and starts from the top of the frame. Applicable to H264, H263 and MPEG4 encoder.

#### V4L2_CID_MPEG_VIDEO_FRAME_RC_ENABLE (boolean)

Frame level rate control enable. If this control is disabled then the quantization parameter for each frame type is constant and set with appropriate controls (e.g. V4L2_CID_MPEG_VIDEO_H263_I_FRAME_QP). If frame rate control is en-
abled then quantization parameter is adjusted to meet the chosen bitrate. Minimum and maximum value for the quantization parameter can be set with appropriate controls (e.g. V4L2_CID_MPEG_VIDEO_H263_MIN_QP). Applicable to encoders.

V4L2_CID_MPEG_VIDEO_MB_RC_ENABLE (boolean) Macroblock level rate control enable. Applicable to the MPEG4 and H264 encoders.

V4L2_CID_MPEG_VIDEO_MPEG4_QPEL (boolean) Quarter pixel motion estimation for MPEG4. Applicable to the MPEG4 encoder.

V4L2_CID_MPEG_VIDEO_H263_I_FRAME_QP (integer) Quantization parameter for an I frame for H263. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_H263_P_FRAME_QP (integer) Quantization parameter for an P frame for H263. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_H263_B_FRAME_QP (integer) Quantization parameter for an B frame for H263. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_H264_I_FRAME_QP (integer) Quantization parameter for an I frame for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_H264_MIN_QP (integer) Minimum quantization parameter for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_H264_MAX_QP (integer) Maximum quantization parameter for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_H264_P_FRAME_QP (integer) Quantization parameter for an P frame for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_H264_B_FRAME_QP (integer) Quantization parameter for an B frame for H264. Valid range: from 0 to 51.

V4L2_CID_MPEG_VIDEO_MPEG4_I_FRAME_QP (integer) Quantization parameter for an I frame for MPEG4. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_MPEG4_P_FRAME_QP (integer) Quantization parameter for an P frame for MPEG4. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_MPEG4_B_FRAME_QP (integer) Quantization parameter for an B frame for MPEG4. Valid range: from 1 to 31.

V4L2_CID_MPEG_VIDEO_VBV_SIZE (integer) The Video Buffer Verifier size in kilobytes, it is used as a limitation of frame skip. The VBV is defined in the standard as a mean to verify that the produced stream will be successfully decoded. The standard describes it as “Part of a hypothetical decoder that is conceptually connected to the output of the encoder. Its purpose is to provide a constraint on the variability of the data rate that an encoder or editing process may produce.”. Applicable to the MPEG1, MPEG2, MPEG4 encoders.

V4L2_CID_MPEG_VIDEO_VBV_DELAY (integer) Sets the initial delay in milliseconds for VBV buffer control.

V4L2_CID_MPEG_VIDEO_MV_H_SEARCH_RANGE (integer) Horizontal search range defines maximum horizontal search area in pixels to search and match for the present Macroblock (MB) in the reference picture. This V4L2 control macro is used to set horizontal search range for motion estimation module in video encoder.
**V4L2_CID_MPEG_VIDEO_MV_V_SEARCH_RANGE (integer)** Vertical search range defines maximum vertical search area in pixels to search and match for the present Macroblock (MB) in the reference picture. This V4L2 control macro is used to set vertical search range for motion estimation module in video encoder.

**V4L2_CID_MPEG_VIDEO_FORCE_KEY_FRAME (button)** Force a key frame for the next queued buffer. Applicable to encoders. This is a general, codec-agnostic keyframe control.

**V4L2_CID_MPEG_VIDEO_H264_CPB_SIZE (integer)** The Coded Picture Buffer size in kilobytes, it is used as a limitation of frame skip. The CPB is defined in the H264 standard as a mean to verify that the produced stream will be successfully decoded. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_I_PERIOD (integer)** Period between I-frames in the open GOP for H264. In case of an open GOP this is the period between two I-frames. The period between IDR (Instantaneous Decoding Refresh) frames is taken from the GOP_SIZE control. An IDR frame, which stands for Instantaneous Decoding Refresh is an I-frame after which no prior frames are referenced. This means that a stream can be restarted from an IDR frame without the need to store or decode any previous frames. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_HEADER_MODE (enum)**

| V4L2_MPEG_VIDEO_HEADER_MODE_SEPARATE | The stream header is returned separately in the first buffer. |
| V4L2_MPEG_VIDEO_HEADER_MODE_JOINED_WITH_1ST_FRAME | The stream header is returned together with the first encoded frame. |

**V4L2_CID_MPEG_VIDEO_REPEAT_SEQ_HEADER (boolean)** Repeat the video sequence headers. Repeating these headers makes random access to the video stream easier. Applicable to the MPEG1, 2 and 4 encoder.

**V4L2_CID_MPEG_VIDEO_DECODER_MPEG4Debeck FILTER (boolean)** Enabled the deblocking post processing filter for MPEG4 decoder. Applicable to the MPEG4 decoder.

**V4L2_CID_MPEG_VIDEO_MPEG4_VOP_TIME_RES (integer)** Vop_time_increment_resolution value for MPEG4. Applicable to the MPEG4 encoder.

**V4L2_CID_MPEG_VIDEO_MPEG4_VOP_TIME_INC (integer)** Vop_time_increment value for MPEG4. Applicable to the MPEG4 encoder.

**V4L2_CID_MPEG_VIDEO_H264_SEI_FRAME_PACKING (boolean)** Enable generation of frame packing supplemental enhancement information in the encoded bitstream. The frame packing SEI message contains the arrangement of L and R planes for 3D viewing. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_SEI_FP_CURRENT_FRAME_0 (boolean)** Sets current frame as frame0 in frame packing SEI. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE (enum)**

| V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_CHEKERBOARD | Pixels are alternatively from L and R. |
| V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_COLUMN | L and R are interlaced by column. |
| V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_ROW | L and R are interlaced by row. |
| V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_SIDE_BY_SIDE | L is on the left, R on the right. |
| V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_TOP_BOTTOM | L is on top, R on bottom. |
| V4L2_MPEG_VIDEO_H264_SEI_FP_ARRANGEMENT_TYPE_TEMPORAL | One view per frame. |

**V4L2_CID_MPEG_VIDEO_H264_FMO (boolean)** Enables flexible macroblock ordering in the encoded bitstream. It is a technique used for restructuring the ordering of macroblocks in pictures. Applicable to the H264 encoder.

1.2. Part I - Video for Linux API
**V4L2_CID_MPEG_VIDEO_H264_FMO_MAP_TYPE** *(enum)*

enum v4l2_mpeg_video_h264_fmo_map_type - When using FMO, the map type divides the image in different scan patterns of macroblocks. Applicable to the H264 encoder. Possible values are:

<table>
<thead>
<tr>
<th>Map Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_INTERLEAVED_SLICES</td>
<td>Slices are interleaved one after other with macroblocks in run length order.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_SCATTERED_SLICES</td>
<td>Scatters the macroblocks based on a mathematical function known to both encoder and decoder.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_FOREGROUND_WITH_LEFT_OVER</td>
<td>Macroblocks arranged in rectangular areas or regions of interest.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_BOX_OUT</td>
<td>Slice groups grow in a cyclic way from centre to outwards.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_RASTER_SCAN</td>
<td>Slice groups grow in raster scan pattern from left to right.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE WIPE_SCAN</td>
<td>Slice groups grow in wipe scan pattern from top to bottom.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_FMO_MAP_TYPE_EXPLICIT</td>
<td>User defined map type.</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_VIDEO_H264_FMO_SLICE_GROUP** *(integer)* Number of slice groups in FMO. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_FMO_CHANGE_DIRECTION** *(enum)*

eenum v4l2_mpeg_video_h264_fmo_change_dir - Specifies a direction of the slice group change for raster and wipe maps. Applicable to the H264 encoder. Possible values are:

<table>
<thead>
<tr>
<th>Change Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_H264_FMO_CHANGE_DIR_RIGHT</td>
<td>Raster scan or wipe right.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_FMO_CHANGE_DIR_LEFT</td>
<td>Reverse raster scan or wipe left.</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_VIDEO_H264_FMO_CHANGE_RATE** *(integer)* Specifies the size of the first slice group for raster and wipe map. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_FMO_RUN_LENGTH** *(integer)* Specifies the number of consecutive macroblocks for the interleaved map. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_ASO** *(boolean)* Enables arbitrary slice ordering in encoded bitstream. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_ASO_SLICE_ORDER** *(integer)* Specifies the slice order in ASO. Applicable to the H264 encoder. The supplied 32-bit integer is interpreted as follows (bit 0 = least significant bit):

<table>
<thead>
<tr>
<th>Bit 0:15</th>
<th>Slice ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 16:32</td>
<td>Slice position or order</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_VIDEO_H264_HIERARCHICAL_CODING** *(boolean)* Enables H264 hierarchical coding. Applicable to the H264 encoder.

**V4L2_CID_MPEG_VIDEO_H264_HIERARCHICAL_CODING_TYPE** *(enum)*

eenum v4l2_mpeg_video_h264_hierarchical_coding_type - Specifies the hierarchical coding type. Applicable to the H264 encoder. Possible values are:

<table>
<thead>
<tr>
<th>Coding Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VIDEO_H264_HIERARCHICAL_CODING_B</td>
<td>Hierarchical B coding.</td>
</tr>
<tr>
<td>V4L2_MPEG_VIDEO_H264_HIERARCHICAL_CODING_P</td>
<td>Hierarchical P coding.</td>
</tr>
</tbody>
</table>

**V4L2_CID_MPEG_VIDEO_H264_HIERARCHICAL_CODING_LAYER** *(integer)* Specifies the number of hierarchical coding layers. Applicable to the H264 encoder.
V4L2_CID_MPEG_VIDEO_H264_HIERARCHICAL_CODING_LAYER_QP (integer) Specifies a user defined QP for each layer. Applicable to the H264 encoder. The supplied 32-bit integer is interpreted as follows (bit 0 = least significant bit):

<table>
<thead>
<tr>
<th>Bit</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:15</td>
<td>QP value</td>
</tr>
<tr>
<td>16:32</td>
<td>Layer number</td>
</tr>
</tbody>
</table>

MFC 5.1 MPEG Controls

The following MPEG class controls deal with MPEG decoding and encoding settings that are specific to the Multi Format Codec 5.1 device present in the S5P family of SoCs by Samsung.

MFC 5.1 Control IDs

V4L2_CID_MPEG_MFC51_VIDEO_DECODER_H264_DISPLAY_DELAY_ENABLE (boolean) If the display delay is enabled then the decoder is forced to return a CAPTURE buffer (decoded frame) after processing a certain number of OUTPUT buffers. The delay can be set through V4L2_CID_MPEG_MFC51_VIDEO_DECODER_H264_DISPLAY_DELAY. This feature can be used for example for generating thumbnails of videos. Applicable to the H264 decoder.

V4L2_CID_MPEG_MFC51_VIDEO_DECODER_H264_DISPLAY_DELAY (integer) Display delay value for H264 decoder. The decoder is forced to return a decoded frame after the set ‘display delay’ number of frames. If this number is low it may result in frames returned out of display order, in addition the hardware may still be using the returned buffer as a reference picture for subsequent frames.

V4L2_CID_MPEG_MFC51_VIDEO_H264_NUM_REF_PIC_FOR_P (integer) The number of reference pictures used for encoding a P picture. Applicable to the H264 encoder.

V4L2_CID_MPEG_MFC51_VIDEO_PADDING (boolean) Padding enable in the encoder - use a color instead of repeating border pixels. Applicable to encoders.

V4L2_CID_MPEG_MFC51_VIDEO_PADDING_YUV (integer) Padding color in the encoder. Applicable to encoders. The supplied 32-bit integer is interpreted as follows (bit 0 = least significant bit):

<table>
<thead>
<tr>
<th>Bit</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:7</td>
<td>V chrominance information</td>
</tr>
<tr>
<td>8:15</td>
<td>U chrominance information</td>
</tr>
<tr>
<td>16:23</td>
<td>Y luminance information</td>
</tr>
<tr>
<td>24:31</td>
<td>Must be zero.</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_MFC51_VIDEO_RC_REACTION_COEFF (integer) Reaction coefficient for MFC rate control. Applicable to encoders.

**Note:**

1. Valid only when the frame level RC is enabled.
2. For tight CBR, this field must be small (ex. 2 ~ 10). For VBR, this field must be large (ex. 100 ~ 1000).
3. It is not recommended to use the greater number than FRAME_RATE * (10^9 / BIT_RATE).

1.2. Part I - Video for Linux API 31

V4L2_CID_MPEG_MFC51_VIDEO_FRAME_SKIP_MODE (enum)

enum v4l2_mpeg_mfc51_video_frame_skip_mode - Indicates in what conditions the encoder should skip frames. If encoding a frame would cause the encoded stream to be larger then a chosen data limit then the frame will be skipped. Possible values are:

<table>
<thead>
<tr>
<th>Enum Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_MFC51_FRAME_SKIP_MODE_DISABLED</td>
<td>Frame skip mode is disabled.</td>
</tr>
<tr>
<td>V4L2_MPEG_MFC51_FRAME_SKIP_MODE_LEVEL_LIMIT</td>
<td>Frame skip mode enabled and buffer limit is set by the chosen level and is defined by the standard.</td>
</tr>
<tr>
<td>V4L2_MPEG_MFC51_FRAME_SKIP_MODE_BUF_LIMIT</td>
<td>Frame skip mode enabled and buffer limit is set by the VBV (MPEG1/2/4) or CPB (H264) buffer size control.</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_MFC51_VIDEO_RC_FIXED_TARGET_BIT (integer) Enable rate-control with fixed target bit. If this setting is enabled, then the rate control logic of the encoder will calculate the average bitrate for a GOP and keep it below or equal the set bitrate target. Otherwise the rate control logic calculates the overall average bitrate for the stream and keeps it below or equal to the set bitrate. In the first case the average bitrate for the whole stream will be smaller then the set bitrate. This is caused because the average is calculated for smaller number of frames, on the other hand enabling this setting will ensure that the stream will meet tight bandwidth constraints. Applicable to encoders.

V4L2_CID_MPEG_MFC51_VIDEO_FORCE_FRAME_TYPE (enum)

enum v4l2_mpeg_mfc51_video_force_frame_type - Force a frame type for the next queued buffer. Applicable to encoders. Possible values are:

<table>
<thead>
<tr>
<th>Enum Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_MFC51_FORCE_FRAME_TYPE_DISABLED</td>
<td>Forcing a specific frame type disabled.</td>
</tr>
<tr>
<td>V4L2_MPEG_MFC51_FORCE_FRAME_TYPE_I_FRAME</td>
<td>Force an I-frame.</td>
</tr>
<tr>
<td>V4L2_MPEG_MFC51_FORCE_FRAME_TYPE_NOT_CODED</td>
<td>Force a non-coded frame.</td>
</tr>
</tbody>
</table>

CX2341x MPEG Controls

The following MPEG class controls deal with MPEG encoding settings that are specific to the Conexant CX23415 and CX23416 MPEG encoding chips.

CX2341x Control IDs

V4L2_CID_MPEG_CX2341X_VIDEO_SPATIAL_FILTER_MODE (enum)

enum v4l2_mpeg_cx2341x_video_spatial_filter_mode - Sets the Spatial Filter mode (default MANUAL). Possible values are:

<table>
<thead>
<tr>
<th>Enum Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_CX2341X_VIDEO_SPATIAL_FILTER_MODE_MANUAL</td>
<td>Choose the filter manually</td>
</tr>
<tr>
<td>V4L2_MPEG_CX2341X_VIDEO_SPATIAL_FILTER_MODE_AUTO</td>
<td>Choose the filter automatically</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_CX2341X_VIDEO_SPATIAL_FILTER (integer (0-15)) The setting for the Spatial Filter. 0 = off, 15 = maximum. (Default is 0.)

V4L2_CID_MPEG_CX2341X_VIDEO_LUMA_SPATIAL_FILTER_TYPE (enum)

enum v4l2_mpeg_cx2341x_video_luma_spatial_filter_type - Select the algorithm to use for the Luma Spatial Filter (default 1D_HOR). Possible values:
Linux Media Subsystem Documentation, Release 4.7.0+

V4L2_MPEG_CX2341X_VIDEO_LUMA_SPATIAL_FILTER_TYPE (enum)

enum v4l2_mpeg_cx2341x_video_luma_spatial_filter_type - Select the algorithm for the Luma Spatial Filter (default OFF). Possible values are:

<table>
<thead>
<tr>
<th>v4l2_mpeg_cx2341x_video_luma_spatial_filter_type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>No filter</td>
</tr>
<tr>
<td>ID_HOR</td>
<td>One-dimensional horizontal</td>
</tr>
<tr>
<td>ID_VERT</td>
<td>One-dimensional vertical</td>
</tr>
<tr>
<td>2D_HV_SEPARABLE</td>
<td>Two-dimensional separable</td>
</tr>
<tr>
<td>2D_SYM_NON_SEPARABLE</td>
<td>Two-dimensional symmetrical non-separable</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_CX2341X_VIDEO_CHROMA_SPATIAL_FILTER_TYPE (enum)

enum v4l2_mpeg_cx2341x_video_chroma_spatial_filter_type - Select the algorithm for the Chroma Spatial Filter (default 1D_HOR). Possible values are:

<table>
<thead>
<tr>
<th>v4l2_mpeg_cx2341x_video_chroma_spatial_filter_type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>No filter</td>
</tr>
<tr>
<td>1D_HOR</td>
<td>One-dimensional horizontal</td>
</tr>
<tr>
<td>2D_HV_SEPARABLE</td>
<td>Two-dimensional separable</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_CX2341X_VIDEO_TEMPORAL_FILTER_MODE (enum)

enum v4l2_mpeg_cx2341x_video_temporal_filter_mode - Sets the Temporal Filter mode (default MANUAL). Possible values are:

<table>
<thead>
<tr>
<th>v4l2_mpeg_cx2341x_video_temporal_filter_mode</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>MANUAL</td>
<td>Choose the filter manually</td>
</tr>
<tr>
<td>AUTO</td>
<td>Choose the filter automatically</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_CX2341X_VIDEO_TEMPORAL_FILTER (integer (0-31)) The setting for the Temporal Filter. 0 = off, 31 = maximum. (Default is 8 for full-scale capturing and 0 for scaled capturing.)

V4L2_CID_MPEG_CX2341X_VIDEO_MEDIAN_FILTER_TYPE (enum)

enum v4l2_mpeg_cx2341x_video_median_filter_type - Median Filter Type (default OFF). Possible values are:

<table>
<thead>
<tr>
<th>v4l2_mpeg_cx2341x_video_median_filter_type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>No filter</td>
</tr>
<tr>
<td>HOR</td>
<td>Horizontal filter</td>
</tr>
<tr>
<td>VERT</td>
<td>Vertical filter</td>
</tr>
<tr>
<td>HOR_VERT</td>
<td>Horizontal and vertical filter</td>
</tr>
<tr>
<td>DIAG</td>
<td>Diagonal filter</td>
</tr>
</tbody>
</table>

V4L2_CID_MPEG_CX2341X_VIDEO_LUMA_MEDIAN_FILTER_BOTTOM (integer (0-255)) Threshold above which the luminance median filter is enabled (default 0)

V4L2_CID_MPEG_CX2341X_VIDEO_LUMA_MEDIAN_FILTER_TOP (integer (0-255)) Threshold below which the luminance median filter is enabled (default 255)

V4L2_CID_MPEG_CX2341X_VIDEO_CHROMA_MEDIAN_FILTER_BOTTOM (integer (0-255)) Threshold above which the chroma median filter is enabled (default 0)

V4L2_CID_MPEG_CX2341X_VIDEO_CHROMA_MEDIAN_FILTER_TOP (integer (0-255)) Threshold below which the chroma median filter is enabled (default 255)

V4L2_CID_MPEG_CX2341X_STREAM_INSERT_NAV_PACKETS (boolean) The CX2341X MPEG encoder can insert one empty MPEG-2 PES packet into the stream between every four video frames. The packet size is 2048 bytes, including the packet_start_code_prefix and stream_id fields. The stream_id is 0xBF (private stream 2). The payload consists of 0x00 bytes, to be filled in by the application. 0 = do not insert, 1 = insert packets.

VPX Control Reference

The VPX controls include controls for encoding parameters of VPx video codec.

1.2. Part I - Video for Linux API
VPX Control IDs

`V4L2_CID_MPEG_VIDEO_VPX_NUM_PARTITIONS` (enum)

*enum v4l2_vp8_num_partitions* - The number of token partitions to use in VP8 encoder. Possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_1_PARTITION</td>
<td>1 coefficient partition</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_2_PARTITIONS</td>
<td>2 coefficient partitions</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_4_PARTITIONS</td>
<td>4 coefficient partitions</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_8_PARTITIONS</td>
<td>8 coefficient partitions</td>
</tr>
</tbody>
</table>

`V4L2_CID_MPEG_VIDEO_VPX_IMD_DISABLE_4X4` (boolean) Setting this prevents intra 4x4 mode in the intra mode decision.

`V4L2_CID_MPEG_VIDEO_VPX_NUM_REF_FRAMES` (enum)

*enum v4l2_vp8_num_ref_frames* - The number of reference pictures for encoding P frames. Possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_1_REF_FRAME</td>
<td>Last encoded frame will be searched</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_2_REF_FRAME</td>
<td>Two frames will be searched among the last encoded frame, the golden frame and the alternate reference (altref) frame. The encoder implementation will decide which two are chosen.</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_3_REF_FRAME</td>
<td>The last encoded frame, the golden frame and the altref frame will be searched.</td>
</tr>
</tbody>
</table>

`V4L2_CID_MPEG_VIDEO_VPX_FILTER_LEVEL` (integer) Indicates the loop filter level. The adjustment of the loop filter level is done via a delta value against a baseline loop filter value.

`V4L2_CID_MPEG_VIDEO_VPX_FILTER_SHARPNESS` (integer) This parameter affects the loop filter. Anything above zero weakens the deblocking effect on the loop filter.

`V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_REF_PERIOD` (integer) Sets the refresh period for the golden frame. The period is defined in number of frames. For a value of ‘n’, every nth frame starting from the first key frame will be taken as a golden frame. For eg. for encoding sequence of 0, 1, 2, 3, 4, 5, 6, 7 where the golden frame refresh period is set as 4, the frames 0, 4, 8 etc will be taken as the golden frames as frame 0 is always a key frame.

`V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_SEL` (enum)

*enum v4l2_vp8_golden_frame_sel* - Selects the golden frame for encoding. Possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_USE_PREV</td>
<td>Use the (n-2)th frame as a golden frame, current frame index being ‘n’.</td>
</tr>
<tr>
<td>V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_USE_REF_PERIOD</td>
<td>Use the previous specific frame indicated by <code>V4L2_CID_MPEG_VIDEO_VPX_GOLDEN_FRAME_REF_PERIOD</code> as a golden frame.</td>
</tr>
</tbody>
</table>

`V4L2_CID_MPEG_VIDEO_VPX_MIN_QP` (integer) Minimum quantization parameter for VP8.

`V4L2_CID_MPEG_VIDEO_VPX_MAX_QP` (integer) Maximum quantization parameter for VP8.

`V4L2_CID_MPEG_VIDEO_VPX_I_FRAME_QP` (integer) Quantization parameter for an I frame for VP8.

`V4L2_CID_MPEG_VIDEO_VPX_P_FRAME_QP` (integer) Quantization parameter for a P frame for VP8.

`V4L2_CID_MPEG_VIDEO_VPX_PROFILE` (integer) Select the desired profile for VPx encoder. Acceptable values are 0, 1, 2 and 3 corresponding to encoder profiles 0, 1, 2 and 3.

Camera Control Reference

The Camera class includes controls for mechanical (or equivalent digital) features of a device such as controllable lenses or sensors.
Camera Control IDs

**V4L2_CID_CAMERA_CLASS** (class)  The Camera class descriptor. Calling `ioctl VIDIOC_QUERYCTRL`, `VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` for this control will return a description of this control class.

**V4L2_CID_EXPOSURE_AUTO** (enum)

**enum v4l2 Exposure Auto Type** - Enables automatic adjustments of the exposure time and/or iris aperture. The effect of manual changes of the exposure time or iris aperture while these features are enabled is undefined, drivers should ignore such requests. Possible values are:

<table>
<thead>
<tr>
<th>V4L2 Exposure Auto Auto</th>
<th>Automatic exposure time, automatic iris aperture.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2 Exposure Shutter Priority</td>
<td>Manual exposure time, auto iris.</td>
</tr>
<tr>
<td>V4L2 Exposure Aperture Priority</td>
<td>Auto exposure time, manual iris.</td>
</tr>
</tbody>
</table>

**V4L2_CID_EXPOSURE_ABSOLUTE** (integer) Determines the exposure time of the camera sensor. The exposure time is limited by the frame interval. Drivers should interpret the values as 100 μs units, where the value 1 stands for 1/10000th of a second, 10000 for 1 second and 100000 for 10 seconds.

**V4L2_CID_EXPOSURE_AUTO_PRIORITY** (boolean) When V4L2_CID_EXPOSURE AUTO is set to AUTO or SHUTTER_PRIORITY, this control determines if the device may dynamically vary the frame rate. By default this feature is disabled (0) and the frame rate must remain constant.

**V4L2_CID_EXPOSURE_BIAS** (integer menu) Determines the automatic exposure compensation, it is effective only when V4L2_CID_EXPOSURE AUTO control is set to AUTO, SHUTTER_PRIORITY or APERTURE_PRIORITY. It is expressed in terms of EV, drivers should interpret the values as 0.001 EV units, where the value 1000 stands for +1 EV.

Increasing the exposure compensation value is equivalent to decreasing the exposure value (EV) and will increase the amount of light at the image sensor. The camera performs the exposure compensation by adjusting absolute exposure time and/or aperture.

**V4L2_CID_EXPOSURE_METERING** (enum)

**enum v4l2 Exposure Metering** - Determines how the camera measures the amount of light available for the frame exposure. Possible values are:

<table>
<thead>
<tr>
<th>V4L2 Exposure Metering Average</th>
<th>Use the light information coming from the entire frame and average giving no weighting to any particular portion of the metered area.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2 Exposure Metering Center Weighted</td>
<td>Average the light information coming from the entire frame giving priority to the center of the metered area.</td>
</tr>
<tr>
<td>V4L2 Exposure Metering Spot</td>
<td>Measure only very small area at the center of the frame.</td>
</tr>
<tr>
<td>V4L2 Exposure Metering Matrix</td>
<td>A multi-zone metering. The light intensity is measured in several points of the frame and the results are combined. The algorithm of the zones selection and their significance in calculating the final value is device dependent.</td>
</tr>
</tbody>
</table>

**V4L2_CID_PAN_RELATIVE** (integer) This control turns the camera horizontally by the specified amount. The unit is undefined. A positive value moves the camera to the right (clockwise when viewed from above), a negative value to the left. A value of zero does not cause motion. This is a write-only control.

**V4L2_CID_TILT_RELATIVE** (integer) This control turns the camera vertically by the specified amount. The unit is undefined. A positive value moves the camera up, a negative value down. A value of zero does not cause motion. This is a write-only control.

**V4L2_CID_PAN_RESET** (button) When this control is set, the camera moves horizontally to the default position.
**V4L2_CID_TILT_RESET** (button) When this control is set, the camera moves vertically to the default position.

**V4L2_CID_PAN_ABSOLUTE** (integer) This control turns the camera horizontally to the specified position. Positive values move the camera to the right (clockwise when viewed from above), negative values to the left. Drivers should interpret the values as arc seconds, with valid values between $-180 \times 3600$ and $+180 \times 3600$ inclusive.

**V4L2_CID_TILT_ABSOLUTE** (integer) This control turns the camera vertically to the specified position. Positive values move the camera up, negative values down. Drivers should interpret the values as arc seconds, with valid values between $-180 \times 3600$ and $+180 \times 3600$ inclusive.

**V4L2_CID_FOCUS_ABSOLUTE** (integer) This control sets the focal point of the camera to the specified position. The unit is undefined. Positive values set the focus closer to the camera, negative values towards infinity.

**V4L2_CID_FOCUS_RELATIVE** (integer) This control moves the focal point of the camera by the specified amount. The unit is undefined. Positive values move the focus closer to the camera, negative values towards infinity. This is a write-only control.

**V4L2_CID_FOCUS_AUTO** (boolean) Enables continuous automatic focus adjustments. The effect of manual focus adjustments while this feature is enabled is undefined, drivers should ignore such requests.

**V4L2_CID_AUTO_FOCUS_START** (button) Starts single auto focus process. The effect of setting this control when **V4L2_CID_FOCUS_AUTO** is set to TRUE (1) is undefined, drivers should ignore such requests.

**V4L2_CID_AUTO_FOCUS_STOP** (button) Aborts automatic focusing started with **V4L2_CID_AUTO_FOCUS_START** control. It is effective only when the continuous autofocus is disabled, that is when **V4L2_CID_FOCUS_AUTO** control is set to FALSE (0).

**V4L2_CID_AUTO_FOCUS_STATUS** (bitmask) The automatic focus status. This is a read-only control.

<table>
<thead>
<tr>
<th>V4L2_AUTO_FOCUS_STATUS_IDLE</th>
<th>Automatic focus is not active.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_AUTO_FOCUS_STATUS_BUSY</td>
<td>Automatic focusing is in progress.</td>
</tr>
<tr>
<td>V4L2_AUTO_FOCUS_STATUS_REACHED</td>
<td>Focus has been reached.</td>
</tr>
<tr>
<td>V4L2_AUTO_FOCUS_STATUS_FAILED</td>
<td>Automatic focus has failed, the driver will not transition from this state until another action is performed by an application.</td>
</tr>
</tbody>
</table>

**V4L2_CID_AUTO_FOCUS_RANGE** (enum)

<table>
<thead>
<tr>
<th>v4l2_auto_focus_range</th>
<th>Determines auto focus distance range for which lens may be adjusted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_AUTO_FOCUS_RANGE_AUTO</td>
<td>The camera automatically selects the focus range.</td>
</tr>
<tr>
<td>V4L2_AUTO_FOCUS_RANGE_NORMAL</td>
<td>Normal distance range, limited for best automatic focus performance.</td>
</tr>
<tr>
<td>V4L2_AUTO_FOCUS_RANGE_MACRO</td>
<td>Macro (close-up) auto focus. The camera will use its minimum possible distance for auto focus.</td>
</tr>
<tr>
<td>V4L2_AUTO_FOCUS_RANGE_INFINITY</td>
<td>The lens is set to focus on an object at infinite distance.</td>
</tr>
</tbody>
</table>

**V4L2_CID_ZOOM_ABSOLUTE** (integer) Specify the objective lens focal length as an absolute value. The zoom unit is driver-specific and its value should be a positive integer.

**V4L2_CID_ZOOM_RELATIVE** (integer) Specify the objective lens focal length relatively to the current value. Positive values move the zoom lens group towards the telephoto direction, negative values towards the wide-angle direction. The zoom unit is driver-specific. This is a write-only control.

**V4L2_CID_ZOOM_CONTINUOUS** (integer) Move the objective lens group at the specified speed until it reaches physical device limits or until an explicit request to stop the movement. A positive value moves the zoom lens group towards the telephoto direction. A value of zero stops the zoom lens group movement. A negative value moves the zoom lens group towards the wide-angle direction. The zoom speed unit is driver-specific.
**V4L2_CID_IRIS_ABSOLUTE** *(integer)* This control sets the camera’s aperture to the specified value. The unit is undefined. Larger values open the iris wider, smaller values close it.

**V4L2_CID_IRIS_RELATIVE** *(integer)* This control modifies the camera’s aperture by the specified amount. The unit is undefined. Positive values open the iris one step further, negative values close it one step further. This is a write-only control.

**V4L2_CID_PRIVACY** *(boolean)* Prevent video from being acquired by the camera. When this control is set to `TRUE` (1), no image can be captured by the camera. Common means to enforce privacy are mechanical obturation of the sensor and firmware image processing, but the device is not restricted to these methods. Devices that implement the privacy control must support read access and may support write access.

**V4L2_CID_BAND_STOP_FILTER** *(integer)* Switch the band-stop filter of a camera sensor on or off, or specify its strength. Such band-stop filters can be used, for example, to filter out the fluorescent light component.

**V4L2_CID_AUTO_N_PRESET_WHITE_BALANCE** *(enum)*

enum **v4l2_auto_n_preset_white_balance** - Sets white balance to automatic, manual or a preset. The presets determine color temperature of the light as a hint to the camera for white balance adjustments resulting in most accurate color representation. The following white balance presets are listed in order of increasing color temperature.

<table>
<thead>
<tr>
<th>Preset</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_WHITE_BALANCE_MANUAL</td>
<td>Manual white balance.</td>
</tr>
<tr>
<td>V4L2_WHITE_BALANCE_AUTO</td>
<td>Automatic white balance adjustments.</td>
</tr>
<tr>
<td>V4L2_WHITE_BALANCE_INCANDESCENT</td>
<td>White balance setting for incandescent (tungsten) lighting. It generally cools down the colors and corresponds approximately to 2500...3500 K color temperature range.</td>
</tr>
<tr>
<td>V4L2_WHITE_BALANCE_FLUORESCENT</td>
<td>White balance preset for fluorescent lighting. It corresponds approximately to 4000...5000 K color temperature.</td>
</tr>
<tr>
<td>V4L2_WHITE_BALANCE_FLUORESCENT_H</td>
<td>With this setting the camera will compensate for fluorescent H lighting.</td>
</tr>
<tr>
<td>V4L2_WHITE_BALANCE_HORIZON</td>
<td>White balance setting for horizon daylight. It corresponds approximately to 5000 K color temperature.</td>
</tr>
<tr>
<td>V4L2_WHITE_BALANCE_DAYLIGHT</td>
<td>White balance preset for daylight (with clear sky). It corresponds approximately to 5000...6500 K color temperature.</td>
</tr>
<tr>
<td>V4L2_WHITE_BALANCE_FLASH</td>
<td>With this setting the camera will compensate for the flash light. It slightly warms up the colors and corresponds roughly to 5000...5500 K color temperature.</td>
</tr>
<tr>
<td>V4L2_WHITE_BALANCE_CLOUDY</td>
<td>White balance preset for moderately overcast sky. This option corresponds approximately to 6500...8000 K color temperature range.</td>
</tr>
<tr>
<td>V4L2_WHITE_BALANCE_SHADE</td>
<td>White balance preset for shade or heavily overcast sky. It corresponds approximately to 9000...10000 K color temperature.</td>
</tr>
</tbody>
</table>

**V4L2_CID_WIDE_DYNAMIC_RANGE** *(boolean)* Enables or disables the camera’s wide dynamic range feature. This feature allows to obtain clear images in situations where intensity of the illumination varies significantly throughout the scene, i.e. there are simultaneously very dark and very bright areas. It is most commonly realized in cameras by combining two subsequent frames with different exposure times. ¹

**V4L2_CID_IMAGE_STABILIZATION** *(boolean)* Enables or disables image stabilization.

**V4L2_CID_ISO_SENSITIVITY** *(integer menu)* Determines ISO equivalent of an image sensor indicating the sensor's sensitivity to light. The numbers are expressed in arithmetic scale, as per ISO 12232:2006 standard, where doubling the sensor sensitivity is represented by doubling the numerical ISO value. Applications should interpret the values as standard ISO values multiplied by 1000, e.g. control value 800 stands for ISO 0.8. Drivers will usually support only a subset of standard ISO values. The effect of setting this control while the `V4L2_CID_ISO_SENSITIVITY_AUTO` control is set

¹ This control may be changed to a menu control in the future, if more options are required.
to a value other than V4L2_CID_ISO_SENSITIVITY_MANUAL is undefined, drivers should ignore such requests.

V4L2_CID_ISO_SENSITIVITY_AUTO (enum)

enum v4l2_iso_sensitivity_type - Enables or disables automatic ISO sensitivity adjustments.

V4L2_CID_SCENE_MODE (enum)

enum v4l2_scene_mode - This control allows to select scene programs as the camera automatic modes optimized for common shooting scenes. Within these modes the camera determines best exposure, aperture, focusing, light metering, white balance and equivalent sensitivity. The controls of those parameters are influenced by the scene mode control. An exact behavior in each mode is subject to the camera specification.

When the scene mode feature is not used, this control should be set to V4L2_SCENE_MODE_NONE to make sure the other possibly related controls are accessible. The following scene programs are defined:
<table>
<thead>
<tr>
<th>Scene Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_SCENE_MODE_NONE</td>
<td>The scene mode feature is disabled.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_BACKLIGHT</td>
<td>Backlight. Compensates for dark shadows when light is coming from behind a subject, also by automatically turning on the flash.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Beach_Snow</td>
<td>Beach and snow. This mode compensates for all-white or bright scenes, which tend to look gray and low contrast, when camera’s automatic exposure is based on an average scene brightness. To compensate, this mode automatically slightly overexposes the frames. The white balance may also be adjusted to compensate for the fact that reflected snow looks bluish rather than white.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Candeleight</td>
<td>Candle light. The camera generally raises the ISO sensitivity and lowers the shutter speed. This mode compensates for relatively close subject in the scene. The flash is disabled in order to preserve the ambiance of the light.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Dawn_Dusk</td>
<td>Dawn and dusk. Preserves the colors seen in low natural light before dusk and after down. The camera may turn off the flash, and automatically focus at infinity. It will usually boost saturation and lower the shutter speed.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Fall_Colors</td>
<td>Fall colors. Increases saturation and adjusts white balance for color enhancement. Pictures of autumn leaves get saturated reds and yellows.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Fireworks</td>
<td>Fireworks. Long exposure times are used to capture the expanding burst of light from a firework. The camera may invoke image stabilization.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Landscape</td>
<td>Landscape. The camera may choose a small aperture to provide deep depth of field and long exposure duration to help capture detail in dim light conditions. The focus is fixed at infinity. Suitable for distant and wide scenery.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Night</td>
<td>Night, also known as Night Landscape. Designed for low light conditions, it preserves detail in the dark areas without blowing out bright objects. The camera generally sets itself to a medium-to-high ISO sensitivity, with a relatively long exposure time, and turns flash off. As such, there will be increased image noise and the possibility of blurred image.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Party_Indoor</td>
<td>Party and indoor. Designed to capture indoor scenes that are lit by indoor background lighting as well as the flash. The camera usually increases ISO sensitivity, and adjusts exposure for the low light conditions.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Portrait</td>
<td>Portrait. The camera adjusts the aperture so that the depth of field is reduced, which helps to isolate the subject against a smooth background. Most cameras recognize the presence of faces in the scene and focus on them. The color hue is adjusted to enhance skin tones. The intensity of the flash is often reduced.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Sports</td>
<td>Sports. Significantly increases ISO and uses a fast shutter speed to freeze motion of rapidly-moving subjects. Increased image noise may be seen in this mode.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Sunset</td>
<td>Sunset. Preserves deep hues seen in sunsets and sunrises. It bumps up the saturation.</td>
</tr>
<tr>
<td>V4L2_SCENE_MODE_Text</td>
<td>Text. It applies extra contrast and sharpness, it is typically a black-and-white mode optimized for readability. Automatic focus may be switched to close-up mode and this setting may also involve some lens-distortion correction.</td>
</tr>
</tbody>
</table>

**V4L2_CID_3A_LOCK (bitmask)** This control locks or unlocks the automatic focus, exposure and white balance. The automatic adjustments can be paused independently by setting the corresponding lock bit to 1. The camera then retains the settings until the lock bit is cleared. The following lock bits are defined:

When a given algorithm is not enabled, drivers should ignore requests to lock it and should return no error. An example might be an application setting bit V4L2_LOCK_WHITE_BALANCE when the
V4L2_CID_AUTO_WHITE_BALANCE control is set to FALSE. The value of this control may be changed by exposure, white balance or focus controls.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_LOCK_EXPOSURE</td>
<td>Automatic exposure adjustments lock.</td>
</tr>
<tr>
<td>V4L2_LOCK_WHITE_BALANCE</td>
<td>Automatic white balance adjustments lock.</td>
</tr>
<tr>
<td>V4L2_LOCK_FOCUS</td>
<td>Automatic focus lock.</td>
</tr>
</tbody>
</table>

V4L2_CID_PAN_SPEED (integer) This control turns the camera horizontally at the specific speed. The unit is undefined. A positive value moves the camera to the right (clockwise when viewed from above), a negative value to the left. A value of zero stops the motion if one is in progress and has no effect otherwise.

V4L2_CID_TILT_SPEED (integer) This control turns the camera vertically at the specified speed. The unit is undefined. A positive value moves the camera up, a negative value down. A value of zero stops the motion if one is in progress and has no effect otherwise.

**FM Transmitter Control Reference**

The FM Transmitter (FM_TX) class includes controls for common features of FM transmissions capable devices. Currently this class includes parameters for audio compression, pilot tone generation, audio deviation limiter, RDS transmission and tuning power features.

**FM_TX Control IDs**

V4L2_CID_FM_TX_CLASS (class) The FM_TX class descriptor. Calling `ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU` for this control will return a description of this control class.

V4L2_CID_RDS_TX_DEVIATION (integer) Configures RDS signal frequency deviation level in Hz. The range and step are driver-specific.

V4L2_CID_RDS_TX_PI (integer) Sets the RDS Programme Identification field for transmission.

V4L2_CID_RDS_TX_PTY (integer) Sets the RDS Programme Type field for transmission. This encodes up to 31 pre-defined programme types.

V4L2_CID_RDS_TX_PS_NAME (string) Sets the Programme Service name (PS_NAME) for transmission. It is intended for static display on a receiver. It is the primary aid to listeners in programme service identification and selection. In Annex E of IEC 62106, the RDS specification, there is a full description of the correct character encoding for Programme Service name strings. Also from RDS specification, PS is usually a single eight character text. However, it is also possible to find receivers which can scroll strings sized as 8 x N characters. So, this control must be configured with steps of 8 characters. The result is it must always contain a string with size multiple of 8.

V4L2_CID_RDS_TX_RADIO_TEXT (string) Sets the Radio Text info for transmission. It is a textual description of what is being broadcasted. RDS Radio Text can be applied when broadcaster wishes to transmit longer PS names, programme-related information or any other text. In these cases, Radio Text should be used in addition to V4L2_CID_RDS_TX_PS_NAME. The encoding for Radio Text strings is also fully described in Annex E of IEC 62106. The length of Radio Text strings depends on which RDS Block is being used to transmit it, either 32 (2A block) or 64 (2B block). However, it is also possible to find receivers which can scroll strings sized as 32 x N or 64 x N characters. So, this control must be configured with steps of 32 or 64 characters. The result is it must always contain a string with size multiple of 32 or 64.

V4L2_CID_RDS_TX_MONO_STEREO (boolean) Sets the Mono/Stereo bit of the Decoder Identification code. If set, then the audio was recorded as stereo.

V4L2_CID_RDS_TX_ARTIFICIAL_HEAD (boolean) Sets the Artificial Head bit of the Decoder Identification code. If set, then the audio was recorded using an artificial head.

V4L2_CID_RDS_TX_COMPRESSED (boolean) Sets the Compressed bit of the Decoder Identification code. If set, then the audio is compressed.
V4L2_CID_RDS_TX_DYNAMICPTY (boolean) Sets the Dynamic PTY bit of the Decoder Identification code. If set, then the PTY code is dynamically switched.

V4L2_CID_RDS_TX_TRAFFIC_ANNOUNCEMENT (boolean) If set, then a traffic announcement is in progress.

V4L2_CID_RDS_TX_TRAFFIC_PROGRAM (boolean) If set, then the tuned programme carries traffic announcements.

V4L2_CID_RDS_TX_MUSIC_SPEECH (boolean) If set, then this channel broadcasts music. If cleared, then it broadcasts speech. If the transmitter doesn’t make this distinction, then it should be set.

V4L2_CID_RDS_TX_ALT_FREQS_ENABLE (boolean) If set, then transmit alternate frequencies.

V4L2_CID_RDS_TX_ALT_FREQS (__u32 array) The alternate frequencies in kHz units. The RDS standard allows for up to 25 frequencies to be defined. Drivers may support fewer frequencies so check the array size.

V4L2_CID_AUDIO_LIMITER_ENABLED (boolean) Enables or disables the audio deviation limiter feature. The limiter is useful when trying to maximize the audio volume, minimize receiver-generated distortion and prevent overmodulation.

V4L2_CID_AUDIO_LIMITER_RELEASE_TIME (integer) Sets the audio deviation limiter feature release time. Unit is in useconds. Step and range are driver-specific.

V4L2_CID_AUDIO_LIMITER_DEVIATION (integer) Configures audio frequency deviation level in Hz. The range and step are driver-specific.

V4L2_CID_AUDIO_COMPRESSION_ENABLED (boolean) Enables or disables the audio compression feature. This feature amplifies signals below the threshold by a fixed gain and compresses audio signals above the threshold by the ratio of Threshold/(Gain + Threshold).

V4L2_CID_AUDIO_COMPRESSION_GAIN (integer) Sets the gain for audio compression feature. It is a dB value. The range and step are driver-specific.

V4L2_CID_AUDIO_COMPRESSION_THRESHOLD (integer) Sets the threshold level for audio compression feature. It is a dB value. The range and step are driver-specific.

V4L2_CID_AUDIO_COMPRESSION_ATTACK_TIME (integer) Sets the attack time for audio compression feature. It is a useconds value. The range and step are driver-specific.

V4L2_CID_AUDIO_COMPRESSION_RELEASE_TIME (integer) Sets the release time for audio compression feature. It is a useconds value. The range and step are driver-specific.

V4L2_CID_PILOT_TONE_ENABLED (boolean) Enables or disables the pilot tone generation feature.

V4L2_CID_PILOT_TONE_DEVIATION (integer) Configures pilot tone frequency deviation level. Unit is in Hz. The range and step are driver-specific.

V4L2_CID_PILOT_TONE_FREQUENCY (integer) Configures pilot tone frequency value. Unit is in Hz. The range and step are driver-specific.

V4L2_CID_TUNE_PREEMPHASIS (enum)

enum v4l2_preemphasis - Configures the pre-emphasis value for broadcasting. A pre-emphasis filter is applied to the broadcast to accentuate the high audio frequencies. Depending on the region, a time constant of either 50 or 75 useconds is used. The enum v4l2_preemphasis defines possible values for pre-emphasis. Here they are:

```
V4L2_PREEMPHASIS_DISABLED     No pre-emphasis is applied.
V4L2_PREEMPHASIS_50_uS        A pre-emphasis of 50 uS is used.
V4L2_PREEMPHASIS_75_uS        A pre-emphasis of 75 uS is used.
```

V4L2_CID_TUNE_POWER_LEVEL (integer) Sets the output power level for signal transmission. Unit is in dBuV. Range and step are driver-specific.

V4L2_CID_TUNE_ANTENNA_CAPACITOR (integer) This selects the value of antenna tuning capacitor manually or automatically if set to zero. Unit, range and step are driver-specific.

For more details about RDS specification, refer to IEC 62106 document, from CENELEC.
Flash Control Reference

The V4L2 flash controls are intended to provide generic access to flash controller devices. Flash controller devices are typically used in digital cameras.

The interface can support both LED and xenon flash devices. As of writing this, there is no xenon flash driver using this interface.

Supported use cases

Unsynchronised LED flash (software strobe)

Unsynchronised LED flash is controlled directly by the host as the sensor. The flash must be enabled by the host before the exposure of the image starts and disabled once it ends. The host is fully responsible for the timing of the flash.

Example of such device: Nokia N900.

Synchronised LED flash (hardware strobe)

The synchronised LED flash is pre-programmed by the host (power and timeout) but controlled by the sensor through a strobe signal from the sensor to the flash.

The sensor controls the flash duration and timing. This information typically must be made available to the sensor.

LED flash as torch

LED flash may be used as torch in conjunction with another use case involving camera or individually.

Flash Control IDs

V4L2_CID_FLASH_CLASS (class) The FLASH class descriptor.

V4L2_CID_FLASH_LED_MODE (menu) Defines the mode of the flash LED, the high-power white LED attached to the flash controller. Setting this control may not be possible in presence of some faults. See V4L2_CID_FLASH_FAULT.

<table>
<thead>
<tr>
<th>V4L2_FLASH_LED_MODE_NONE</th>
<th>Off.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_FLASH_LED_MODE_FLASH</td>
<td>Flash mode.</td>
</tr>
<tr>
<td>V4L2_FLASH_LED_MODE_TORCH</td>
<td>Torch mode. See V4L2_CID_FLASH_TORCH_INTENSITY.</td>
</tr>
</tbody>
</table>

V4L2_CID_FLASH_STROBE_SOURCE (menu) Defines the source of the flash LED strobe.

| V4L2_FLASH_STROBE_SOURCE_SOFTWARE | The flash strobe is triggered by using the V4L2_CID_FLASH_STROBE control. |
| V4L2_FLASH_STROBE_SOURCE_EXTERNAL | The flash strobe is triggered by an external source. Typically this is a sensor, which makes it possible to synchronises the flash strobe start to exposure start. |

V4L2_CID_FLASH_STROBE (button) Strobe flash. Valid when V4L2_CID_FLASH_LED_MODE is set to V4L2_FLASH_LED_MODE_FLASH and V4L2_CID_FLASH_STROBE_SOURCE is set to V4L2_FLASH_STROBE_SOURCE_SOFTWARE. Setting this control may not be possible in presence of some faults. See V4L2_CID_FLASH_FAULT.

V4L2_CID_FLASH_STROBE_STOP (button) Stop flash strobe immediately.
V4L2_CID_FLASH_STROBE_STATUS (boolean) Strobe status: whether the flash is strobing at the moment or not. This is a read-only control.

V4L2_CID_FLASH_TIMEOUT (integer) Hardware timeout for flash. The flash strobe is stopped after this period of time has passed from the start of the strobe.

V4L2_CID_FLASH_INTENSITY (integer) Intensity of the flash strobe when the flash LED is in flash mode (V4L2_FLASH_LED_MODE_FLASH). The unit should be milliamps (mA) if possible.

V4L2_CID_FLASH_TORCH_INTENSITY (integer) Intensity of the flash LED in torch mode (V4L2_FLASH_LED_MODE_TORCH). The unit should be milliamps (mA) if possible. Setting this control may not be possible in presence of some faults. See V4L2_CID_FLASH_FAULT.

V4L2_CID_FLASH_INDICATOR_INTENSITY (integer) Intensity of the indicator LED. The indicator LED may be fully independent of the flash LED. The unit should be microamps (µA) if possible.

V4L2_CID_FLASH_FAULT (bitmask) Faults related to the flash. The faults tell about specific problems in the flash chip itself or the LEDs attached to it. Faults may prevent further use of some of the flash controls. In particular, V4L2_CID_FLASH_LED_MODE is set to V4L2_FLASH_LED_MODE_NONE if the fault affects the flash LED. Exactly which faults have such an effect is chip dependent. Reading the faults resets the control and returns the chip to a usable state if possible.

| V4L2_FLASH_FAULT_OVER_VOLTAGE | Flash controller voltage to the flash LED has exceeded the limit specific to the flash controller. |
| V4L2_FLASH_FAULT_TIMEOUT       | The flash strobe was still on when the timeout set by the user — V4L2_CID_FLASH_TIMEOUT control — has expired. Not all flash controllers may set this in all such conditions. |
| V4L2_FLASH_FAULT_OVER_TEMPERATURE | The flash controller has overheated. |
| V4L2_FLASH_FAULT_SHORT_CIRCUIT | The short circuit protection of the flash controller has been triggered. |
| V4L2_FLASH_FAULT_OVER_CURRENT  | Current in the LED power supply has exceeded the limit specific to the flash controller. |
| V4L2_FLASH_FAULT_INDICATOR     | The flash controller has detected a short or open circuit condition on the indicator LED. |
| V4L2_FLASH_FAULT_UNDER_VOLTAGE | Flash controller voltage to the flash LED has been below the minimum limit specific to the flash controller. |
| V4L2_FLASH_FAULT_INPUT_VOLTAGE | The input voltage of the flash controller is below the limit under which strobing the flash at full current will not be possible. The condition persists until this flag is no longer set. |
| V4L2_FLASH_FAULT_LED_OVER_TEMPERATURE | The temperature of the LED has exceeded its allowed upper limit. |

V4L2_CID_FLASH_CHARGE (boolean) Enable or disable charging of the xenon flash capacitor.

V4L2_CID_FLASH_READY (boolean) Is the flash ready to strobe? Xenon flashes require their capacitors charged before strobing. LED flashes often require a cooldown period after strobe during which another strobe will not be possible. This is a read-only control.

**JPEG Control Reference**

The JPEG class includes controls for common features of JPEG encoders and decoders. Currently it includes features for codecs implementing progressive baseline DCT compression process with Huffman entropy coding.

**JPEG Control IDs**

V4L2_CID_JPEG_CLASS (class) The JPEG class descriptor. Calling `ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU` for this control will return a description of this con-
The chroma subsampling factors describe how each component of an input image is sampled, in respect to maximum sample rate in each spatial dimension. See ITU-T.81, clause A.1.1. for more details. The V4L2_CID_JPEG_CHROMA_SUBSAMPLING control determines how Cb and Cr components are downsampled after converting an input image from RGB to Y’CbCr color space.

<table>
<thead>
<tr>
<th>V4L2_CID_JPEG_CHROMA_SUBSAMPLING</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>44</td>
<td>No chroma subsampling, each pixel has Y, Cr and Cb values.</td>
</tr>
<tr>
<td>422</td>
<td>Horizontally subsample Cr, Cb components by a factor of 2.</td>
</tr>
<tr>
<td>429</td>
<td>Subsample Cr, Cb components horizontally and vertically by 2.</td>
</tr>
<tr>
<td>411</td>
<td>Horizontally subsample Cr, Cb components by a factor of 4.</td>
</tr>
<tr>
<td>410</td>
<td>Subsample Cb components horizontally by 4 and vertically by 2.</td>
</tr>
<tr>
<td>GRAY</td>
<td>Use only luminance component.</td>
</tr>
</tbody>
</table>

V4L2_CID_JPEG_RESTART_INTERVAL (integer) The restart interval determines an interval of inserting RSTm markers (m = 0..7). The purpose of these markers is to additionally reinitialize the encoder process, in order to process blocks of an image independently. For the lossy compression processes, the restart interval unit is MCU (Minimum Coded Unit) and its value is contained in DRI (Define Restart Interval) marker. If V4L2_CID_JPEG_RESTART_INTERVAL control is set to 0, DRI and RSTm markers will not be inserted.

V4L2_CID_JPEG_COMPRESSION_QUALITY (integer) V4L2_CID_JPEG_COMPRESSION_QUALITY control determines trade-off between image quality and size. It provides simpler method for applications to control image quality, without a need for direct reconfiguration of luminance and chrominance quantization tables. In cases where a driver uses quantization tables configured directly by an application, using interfaces defined elsewhere, V4L2_CID_JPEG_COMPRESSION_QUALITY control should be set by driver to 0.

The value range of this control is driver-specific. Only positive, non-zero values are meaningful. The recommended range is 1 - 100, where larger values correspond to better image quality.

V4L2_CID_JPEG_ACTIVE_MARKER (bitmask) Specify which JPEG markers are included in compressed stream. This control is valid only for encoders.

<table>
<thead>
<tr>
<th>V4L2_CID_JPEG_ACTIVE_MARKER_APP0</th>
<th>Application data segment APP0.</th>
</tr>
</thead>
<tbody>

<td>Comment segment.</td>
</tr>
<tr>
<td>V4L2_CID_JPEG_ACTIVE_MARKER_DQT</td>
<td>Quantization tables segment.</td>
</tr>
<tr>
<td>V4L2_CID_JPEG_ACTIVE_MARKER_DHT</td>
<td>Huffman tables segment.</td>
</tr>
</tbody>
</table>

For more details about JPEG specification, refer to ITU-T.81, JFIF, W3C JPEG JFIF.

Image Source Control Reference

The Image Source control class is intended for low-level control of image source devices such as image sensors. The devices feature an analogue to digital converter and a bus transmitter to transmit the image data out of the device.

Image Source Control IDs

V4L2_CID_IMAGE_SOURCE_CLASS (class) The IMAGE_SOURCE class descriptor.

V4L2_CID_VBLANK (integer) Vertical blanking. The idle period after every frame during which no image data is produced. The unit of vertical blanking is a line. Every line has length of the image width plus horizontal blanking at the pixel rate defined by V4L2_CID_PIXEL_RATE control in the same sub-device.
V4L2_CID_HBLANK (integer) Horizontal blanking. The idle period after every line of image data during which no image data is produced. The unit of horizontal blanking is pixels.

V4L2_CID_ANALOGUE_GAIN (integer) Analogue gain is gain affecting all colour components in the pixel matrix. The gain operation is performed in the analogue domain before A/D conversion.

V4L2_CID_TEST_PATTERN_RED (integer) Test pattern red colour component.

V4L2_CID_TEST_PATTERN_GREEN (integer) Test pattern green (next to red) colour component.

V4L2_CID_TEST_PATTERN_BLUE (integer) Test pattern blue colour component.

V4L2_CID_TEST_PATTERN_GREEN (integer) Test pattern green (next to blue) colour component.

Image Process Control Reference

The Image Process control class is intended for low-level control of image processing functions. Unlike V4L2_CID_IMAGE_SOURCE_CLASS, the controls in this class affect processing the image, and do not control capturing of it.

Image Process Control IDs

V4L2_CID_IMAGE_PROC_CLASS (class) The IMAGE_PROC class descriptor.

V4L2_CID_LINK_FREQ (integer menu) Data bus frequency. Together with the media bus pixel code, bus type (clock cycles per sample), the data bus frequency defines the pixel rate (V4L2_CID_PIXEL_RATE) in the pixel array (or possibly elsewhere, if the device is not an image sensor). The frame rate can be calculated from the pixel clock, image width and height and horizontal and vertical blanking. While the pixel rate control may be defined elsewhere than in the subdev containing the pixel array, the frame rate cannot be obtained from that information. This is because only on the pixel array it can be assumed that the vertical and horizontal blanking information is exact: no other blanking is allowed in the pixel array. The selection of frame rate is performed by selecting the desired horizontal and vertical blanking. The unit of this control is Hz.

V4L2_CID_PIXEL_RATE (64-bit integer) Pixel rate in the source pads of the subdev. This control is read-only and its unit is pixels / second.

V4L2_CID_TEST_PATTERN (menu) Some capture/display/sensor devices have the capability to generate test pattern images. These hardware specific test patterns can be used to test if a device is working properly.

Digital Video Control Reference

The Digital Video control class is intended to control receivers and transmitters for VGA, DVI (Digital Visual Interface), HDMI (HDMI) and DisplayPort (DP). These controls are generally expected to be private to the receiver or transmitter subdevice that implements them, so they are only exposed on the /dev/v4l-subdev* device node.

Note:
Note that these devices can have multiple input or output pads which are hooked up to e.g. HDMI connectors. Even though the subdevice will receive or transmit video from/to only one of those pads, the other pads can still be active when it comes to EDID (Extended Display Identification Data, EDID) and HDCP (High-bandwidth Digital Content Protection System, HDCP) processing, allowing the device to do the fairly slow EDID/HDCP handling in advance. This allows for quick switching between connectors.
These pads appear in several of the controls in this section as bitmasks, one bit for each pad. Bit 0 corresponds to pad 0, bit 1 to pad 1, etc. The maximum value of the control is the set of valid pads.

Digital Video Control IDs

V4L2_CID_DV_CLASS (class) The Digital Video class descriptor.

V4L2_CID_DV_TX_HOTPLUG (bitmask) Many connectors have a hotplug pin which is high if EDID information is available from the source. This control shows the state of the hotplug pin as seen by the transmitter. Each bit corresponds to an output pad on the transmitter. If an output pad does not have an associated hotplug pin, then the bit for that pad will be 0. This read-only control is applicable to DVI-D, HDMI and DisplayPort connectors.

V4L2_CID_DV_TX_RXSENSE (bitmask) Rx Sense is the detection of pull-ups on the TMDS clock lines. This normally means that the sink has left/entered standby (i.e. the transmitter can sense that the receiver is ready to receive video). Each bit corresponds to an output pad on the transmitter. If an output pad does not have an associated Rx Sense, then the bit for that pad will be 0. This read-only control is applicable to DVI-D and HDMI devices.

V4L2_CID_DV_TX_EDID_PRESENT (bitmask) When the transmitter sees the hotplug signal from the receiver it will attempt to read the EDID. If set, then the transmitter has read at least the first block (= 128 bytes). Each bit corresponds to an output pad on the transmitter. If an output pad does not support EDIDs, then the bit for that pad will be 0. This read-only control is applicable to VGA, DVI-A/D, HDMI and DisplayPort connectors.

V4L2_CID_DV_TX_MODE (enum) enum v4l2_dv_tx_mode - HDMI transmitters can transmit in DVI-D mode (just video) or in HDMI mode (video + audio + auxiliary data). This control selects which mode to use: V4L2_DV_TX_MODE_DVI_D or V4L2_DV_TX_MODE_HDMI. This control is applicable to HDMI connectors.

V4L2_CID_DV_TX_RGB_RANGE (enum) enum v4l2_dv_rgb_range - Select the quantization range for RGB output. V4L2_DV_RANGE_AUTO follows the RGB quantization range specified in the standard for the video interface (i.e. CEA-861-E for HDMI). V4L2_DV_RANGE_LIMITED and V4L2_DV_RANGE_FULL override the standard to be compatible with sinks that have not implemented the standard correctly (unfortunately quite common for HDMI and DVI-D). Full range allows all possible values to be used whereas limited range sets the range to (16 << (N-8)) - (235 << (N-8)) where N is the number of bits per component. This control is applicable to VGA, DVI-A/D, HDMI and DisplayPort connectors.

V4L2_CID_DV_TX_IT_CONTENT_TYPE (enum) enum v4l2_dv_it_content_type - Configures the IT Content Type of the transmitted video. This information is sent over HDMI and DisplayPort connectors as part of the AVI InfoFrame. The term ‘IT Content’ is used for content that originates from a computer as opposed to content from a TV broadcast or an analog source. The enum v4l2_dv_it_content_type defines the possible content types:

<table>
<thead>
<tr>
<th>V4L2_DV_IT_CONTENT_TYPE_GRAPHICS</th>
<th>Graphics content. Pixel data should be passed unfiltered and without analog reconstruction.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_DV_IT_CONTENT_TYPE_PHOTO</td>
<td>Photo content. The content is derived from digital still pictures. The content should be passed through with minimal scaling and picture enhancements.</td>
</tr>
<tr>
<td>V4L2_DV_IT_CONTENT_TYPE_CINEMA</td>
<td>Cinema content.</td>
</tr>
<tr>
<td>V4L2_DV_IT_CONTENT_TYPE_GAME</td>
<td>Game content. Audio and video latency should be minimized.</td>
</tr>
<tr>
<td>V4L2_DV_IT_CONTENT_TYPE_NO_ITC</td>
<td>No IT Content information is available and the ITC bit in the AVI InfoFrame is set to 0.</td>
</tr>
</tbody>
</table>

V4L2_CID_DV_RX_POWER_PRESENT (bitmask) Detects whether the receiver receives power from the source (e.g. HDMI carries 5V on one of the pins). This is often used to power an eeprom which contains EDID information, such that the source can read the EDID even if the sink is in standby/power...
off. Each bit corresponds to an input pad on the transmitter. If an input pad cannot detect whether power is present, then the bit for that pad will be 0. This read-only control is applicable to DVI-D, HDMI and DisplayPort connectors.

V4L2_CID_DV_RX_RGB_RANGE (enum)

enum v4l2_dv_rgb_range - Select the quantization range for RGB input. V4L2_DV_RANGE_AUTO follows the RGB quantization range specified in the standard for the video interface (ie. CEA-861-E for HDMI). V4L2_DV_RANGE_LIMITED and V4L2_DV_RANGE_FULL override the standard to be compatible with sources that have not implemented the standard correctly (unfortunately quite common for HDMI and DVI-D). Full range allows all possible values to be used whereas limited range sets the range to \((16 << (N-8)) - (235 << (N-8))\) where N is the number of bits per component. This control is applicable to VGA, DVI-A/D, HDMI and DisplayPort connectors.

V4L2_CID_DV_RX_IT_CONTENT_TYPE (enum)

enum v4l2_dv_it_content_type - Reads the IT Content Type of the received video. This information is sent over HDMI and DisplayPort connectors as part of the AVI InfoFrame. The term ‘IT Content’ is used for content that originates from a computer as opposed to content from a TV broadcast or an analog source. See V4L2_CID_DV_TX_IT_CONTENT_TYPE for the available content types.

FM Receiver Control Reference

The FM Receiver (FM_RX) class includes controls for common features of FM Reception capable devices.

FM_RX Control IDs

V4L2_CID_FM_RX_CLASS (class) The FM_RX class descriptor. Calling \(\text{ioctl(VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL, VIDIOC_QUERYMENU)}\) for this control will return a description of this control class.

V4L2_CID_RDS_RECEPTION (boolean) Enables/disables RDS reception by the radio tuner

V4L2_CID_RDS_RX_PTY (integer) Gets RDS Programme Type field. This encodes up to 31 pre-defined programme types.

V4L2_CID_RDS_RX_PS_NAME (string) Gets the Programme Service name (PS_NAME). It is intended for static display on a receiver. It is the primary aid to listeners in programme service identification and selection. In Annex E of IEC 62106, the RDS specification, there is a full description of the correct character encoding for Programme Service name strings. Also from RDS specification, PS is usually a single eight character text. However, it is also possible to find receivers which can scroll strings sized as 8 x N characters. So, this control must be configured with steps of 8 characters. The result is it must always contain a string with size multiple of 8.

V4L2_CID_RDS_RX_RADIO_TEXT (string) Gets the Radio Text info. It is a textual description of what is being broadcasted. RDS Radio Text can be applied when broadcaster wishes to transmit longer PS names, programme-related information or any other text. In these cases, RadioText can be used in addition to V4L2_CID_RDS_RX_PS_NAME. The encoding for Radio Text strings is also fully described in Annex E of IEC 62106. The length of Radio Text strings depends on which RDS Block is being used to transmit it, either 32 (2A block) or 64 (2B block). However, it is also possible to find receivers which can scroll strings sized as 32 x N or 64 x N characters. So, this control must be configured with steps of 32 or 64 characters. The result is it must always contain a string with size multiple of 32 or 64.

V4L2_CID_RDS_RX_TRAFFIC_ANNOUNCEMENT (boolean) If set, then a traffic announcement is in progress.

V4L2_CID_RDS_RX_TRAFFIC_PROGRAM (boolean) If set, then the tuned programme carries traffic announcements.

V4L2_CID_RDS_RX_MUSIC_SPEECH (boolean) If set, then this channel broadcasts music. If cleared, then it broadcasts speech. If the transmitter doesn’t make this distinction, then it will be set.

V4L2_CID_TUNE_DEEMPHASIS (enum)

1.2. Part I - Video for Linux API
enum v4l2_deemphasis - Configures the de-emphasis value for reception. A de-emphasis filter is applied to the broadcast to accentuate the high audio frequencies. Depending on the region, a time constant of either 50 or 75 microseconds is used. The enum v4l2_deemphasis defines possible values for de-emphasis. Here they are:

<table>
<thead>
<tr>
<th>V4L2 DEEMPHASIS_DISABLED</th>
<th>No de-emphasis is applied.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2 DEEMPHASIS 50 uS</td>
<td>A de-emphasis of 50 uS is used.</td>
</tr>
<tr>
<td>V4L2 DEEMPHASIS 75 uS</td>
<td>A de-emphasis of 75 uS is used.</td>
</tr>
</tbody>
</table>

Detect Control Reference

The Detect class includes controls for common features of various motion or object detection capable devices.

Detect Control IDs

V4L2_CID_DETECT_CLASS (class) The Detect class descriptor. Calling `ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU` for this control will return a description of this control class.

V4L2_CID_DETECT_MD_MODE (menu) Sets the motion detection mode.

<table>
<thead>
<tr>
<th>V4L2 DETECT_MD_MODE_DISABLED</th>
<th>Disable motion detection.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2 DETECT_MD_MODE_GLOBAL</td>
<td>Use a single motion detection threshold.</td>
</tr>
<tr>
<td>V4L2 DETECT_MD_MODE_THRESHOLD_GRID</td>
<td>The image is divided into a grid, each cell with its own motion detection threshold. These thresholds are set through the V4L2_CID_DETECT_MD_THRESHOLD_GRID matrix control.</td>
</tr>
<tr>
<td>V4L2 DETECT_MD_MODE_REGION_GRID</td>
<td>The image is divided into a grid, each cell with its own region value that specifies which per-region motion detection thresholds should be used. Each region has its own thresholds. How these per-region thresholds are set up is driver-specific. The region values for the grid are set through the V4L2_CID_DETECT_MD_REGION_GRID matrix control.</td>
</tr>
</tbody>
</table>

V4L2_CID_DETECT_MD_GLOBAL_THRESHOLD (integer) Sets the global motion detection threshold to be used with the V4L2 DETECT_MD_MODE_GLOBAL motion detection mode.

V4L2_CID_DETECT_MD_THRESHOLD_GRID (__u16 matrix) Sets the motion detection thresholds for each cell in the grid. To be used with the V4L2 DETECT_MD_MODE_THRESHOLD_GRID motion detection mode. Matrix element (0, 0) represents the cell at the top-left of the grid.

V4L2_CID_DETECT_MD_REGION_GRID (__u8 matrix) Sets the motion detection region value for each cell in the grid. To be used with the V4L2 DETECT_MD_MODE_REGION_GRID motion detection mode. Matrix element (0, 0) represents the cell at the top-left of the grid.

RF Tuner Control Reference

The RF Tuner (RF_TUNER) class includes controls for common features of devices having RF tuner.

In this context, RF tuner is radio receiver circuit between antenna and demodulator. It receives radio frequency (RF) from the antenna and converts that received signal to lower intermediate frequency (IF) or baseband frequency (BB). Tuners that could do baseband output are often called Zero-IF tuners. Older tuners were typically simple PLL tuners inside a metal box, whilst newer ones are highly integrated chips without a metal box “silicon tuners”. These controls are mostly applicable for new feature rich silicon tuners, just because older tuners does not have much adjustable features.

For more information about RF tuners see Tuner (radio) and RF front end from Wikipedia.
RF_TUNER Control IDs

V4L2_CID_RF_TUNER_CLASS (class) The RF_TUNER class descriptor. Calling `ioctl` V4L2_QUERYCTRL, V4L2_QUERY_EXT_CTRL and V4L2_QUERYMENU for this control will return a description of this control class.

V4L2_CID_RF_TUNER_BANDWIDTH_AUTO (boolean) Enables/disables tuner radio channel bandwidth configuration. In automatic mode bandwidth configuration is performed by the driver.

V4L2_CID_RF_TUNER_BANDWIDTH (integer) Filter(s) on tuner signal path are used to filter signal according to receiving party needs. Driver configures filters to fulfill desired bandwidth requirement. Used when V4L2_CID_RF_TUNER_BANDWIDTH_AUTO is not set. Unit is in Hz. The range and step are driver-specific.

V4L2_CID_RF_TUNER_LNA_GAIN_AUTO (boolean) Enables/disables LNA automatic gain control (AGC)

V4L2_CID_RF_TUNER_MIXER_GAIN_AUTO (boolean) Enables/disables mixer automatic gain control (AGC)

V4L2_CID_RF_TUNER_IF_GAIN_AUTO (boolean) Enables/disables IF automatic gain control (AGC)

V4L2_CID_RF_TUNER_RF_GAIN (integer) The RF amplifier is the very first amplifier on the receiver signal path, just right after the antenna input. The difference between the LNA gain and the RF gain in this document is that the LNA gain is integrated in the tuner chip while the RF gain is a separate chip. There may be both RF and LNA gain controls in the same device. The range and step are driver-specific.

V4L2_CID_RF_TUNER_LNA_GAIN (integer) LNA (low noise amplifier) gain is first gain stage on the RF tuner signal path. It is located very close to tuner antenna input. Used when V4L2_CID_RF_TUNER_LNA_GAIN_AUTO is not set. See V4L2_CID_RF_TUNER_RF_GAIN to understand how RF gain and LNA gain differs from each other. The range and step are driver-specific.

V4L2_CID_RF_TUNER_MIXER_GAIN (integer) Mixer gain is second gain stage on the RF tuner signal path. It is located inside mixer block, where RF signal is down-converted by the mixer. Used when V4L2_CID_RF_TUNER_MIXER_GAIN_AUTO is not set. The range and step are driver-specific.

V4L2_CID_RF_TUNER_IF_GAIN (integer) IF gain is last gain stage on the RF tuner signal path. It is located on output of RF tuner. It controls signal level of intermediate frequency output or baseband output. Used when V4L2_CID_RF_TUNER_IF_GAIN_AUTO is not set. The range and step are driver-specific.

V4L2_CID_RF_TUNER_PLL_LOCK (boolean) Is synthesizer PLL locked? RF tuner is receiving given frequency when this control is set. This is a read-only control.

Data Formats

Data Format Negotiation

Different devices exchange different kinds of data with applications, for example video images, raw or sliced VBI data, RDS datagrams. Even within one kind many different formats are possible, in particular an abundance of image formats. Although drivers must provide a default and the selection persists across closing and reopening a device, applications should always negotiate a data format before engaging in data exchange. Negotiation means the application asks for a particular format and the driver selects and reports the best the hardware can do to satisfy the request. Of course applications can also just query the current selection.

A single mechanism exists to negotiate all data formats using the aggregate struct `v4l2_format` and the `VIDIOC_G_FMT` and `VIDIOC_S_FMT` ioctls. Additionally the `VIDIOC_TRY_FMT` ioctl can be used to examine what the hardware could do, without actually selecting a new data format. The data formats supported by the V4L2 API are covered in the respective device section in Interfaces. For a closer look at image formats see Image Formats.

The `VIDIOC_S_FMT` ioctl is a major turning-point in the initialization sequence. Prior to this point multiple panel applications can access the same device concurrently to select the current input, change controls
or modify other properties. The first `VIDIOC_S_FMT` assigns a logical stream (video data, VBI data etc.) exclusively to one file descriptor.

Exclusive means no other application, more precisely no other file descriptor, can grab this stream or change device properties inconsistent with the negotiated parameters. A video standard change for example, when the new standard uses a different number of scan lines, can invalidate the selected image format. Therefore only the file descriptor owning the stream can make invalidating changes. Accordingly multiple file descriptors which grabbed different logical streams prevent each other from interfering with their settings. When for example video overlay is about to start or already in progress, simultaneous video capturing may be restricted to the same cropping and image size.

When applications omit the `VIDIOC_S_FMT` ioctl its locking side effects are implied by the next step, the selection of an I/O method with the `VIDIOC_REQBUFS` ioctl or implicit with the first `read()` or `write()` call.

Generally only one logical stream can be assigned to a file descriptor, the exception being drivers permitting simultaneous video capturing and overlay using the same file descriptor for compatibility with V4L and earlier versions of V4L2. Switching the logical stream or returning into “panel mode” is possible by closing and reopening the device. Drivers may support a switch using `VIDIOC_S_FMT`.

All drivers exchanging data with applications must support the `VIDIOC_G_FMT` and `VIDIOC_S_FMT` ioctl. Implementation of the `VIDIOC_TRY_FMT` is highly recommended but optional.

### Image Format Enumeration

Apart of the generic format negotiation functions a special ioctl to enumerate all image formats supported by video capture, overlay or output devices is available. 1

The `VIDIOC_ENUM_FMT` ioctl must be supported by all drivers exchanging image data with applications.

**Important**

Drivers are not supposed to convert image formats in kernel space. They must enumerate only formats directly supported by the hardware. If necessary driver writers should publish an example conversion routine or library for integration into applications.

### Single- and multi-planar APIs

Some devices require data for each input or output video frame to be placed in discontiguous memory buffers. In such cases, one video frame has to be addressed using more than one memory address, i.e. one pointer per “plane”. A plane is a sub-buffer of the current frame. For examples of such formats see Image Formats.

Initially, V4L2 API did not support multi-planar buffers and a set of extensions has been introduced to handle them. Those extensions constitute what is being referred to as the “multi-planar API”.

Some of the V4L2 API calls and structures are interpreted differently, depending on whether single- or multi-planar API is being used. An application can choose whether to use one or the other by passing a corresponding buffer type to its ioctl calls. Multi-planar versions of buffer types are suffixed with an _MPLANE string. For a list of available multi-planar buffer types see enum `v4l2_buf_type`.

### Multi-planar formats

Multi-planar API introduces new multi-planar formats. Those formats use a separate set of FourCC codes. It is important to distinguish between the multi-planar API and a multi-planar format. Multi-planar API calls

---

1 Enumerating formats an application has no a-priori knowledge of (otherwise it could explicitly ask for them and need not enumerate) seems useless, but there are applications serving as proxy between drivers and the actual video applications for which this is useful.
can handle all single-planar formats as well (as long as they are passed in multi-planar API structures), while the single-planar API cannot handle multi-planar formats.

Calls that distinguish between single and multi-planar APIs

**VIDIOC_QUERYCAP**  Two additional multi-planar capabilities are added. They can be set together with non-multi-planar ones for devices that handle both single- and multi-planar formats.

**VIDIOC_G_FMT, VIDIOC_S_FMT, VIDIOC_TRY_FMT**  New structures for describing multi-planar formats are added: struct `v4l2_pix_format_mplane` and struct `v4l2_plane_pix_format`. Drivers may define new multi-planar formats, which have distinct FourCC codes from the existing single-planar ones.

**VIDIOC_QBUF, VIDIOC_DQBUF, VIDIOC_QUERYBUF**  A new struct `v4l2_plane` structure for describing planes is added. Arrays of this structure are passed in the new `m.planes` field of struct `v4l2_buffer`.

**VIDIOC_REQBUFS**  Will allocate multi-planar buffers as requested.

Image Cropping, Insertion and Scaling

Some video capture devices can sample a subsection of the picture and shrink or enlarge it to an image of arbitrary size. We call these abilities cropping and scaling. Some video output devices can scale an image up or down and insert it at an arbitrary scan line and horizontal offset into a video signal.

Applications can use the following API to select an area in the video signal, query the default area and the hardware limits.

**Note:**

> Despite their name, the **VIDIOC_CROPCAP**, **VIDIOC_G_CROP** and **VIDIOC_S_CROP** ioctls apply to input as well as output devices.

Scaling requires a source and a target. On a video capture or overlay device the source is the video signal, and the cropping ioctls determine the area actually sampled. The target are images read by the application or overlaid onto the graphics screen. Their size (and position for an overlay) is negotiated with the **VIDIOC_G_FMT** and **VIDIOC_S_FMT** ioctls.

On a video output device the source are the images passed in by the application, and their size is again negotiated with the **VIDIOC_G_FMT** and **VIDIOC_S_FMT** ioctls, or may be encoded in a compressed video stream. The target is the video signal, and the cropping ioctls determine the area where the images are inserted.

Source and target rectangles are defined even if the device does not support scaling or the **VIDIOC_G_CROP** and **VIDIOC_S_CROP** ioctls. Their size (and position where applicable) will be fixed in this case.

**Note:**

All capture and output devices must support the **VIDIOC_CROPCAP** ioctl such that applications can determine if scaling takes place.

Cropping Structures

For capture devices the coordinates of the top left corner, width and height of the area which can be sampled is given by the bounds substructure of the struct `v4l2_cropcap` returned by the **VIDIOC_CROPCAP**
ioctl. To support a wide range of hardware this specification does not define an origin or units. However by convention drivers should horizontally count unscaled samples relative to 0H (the leading edge of the horizontal sync pulse, see Figure 4.1. Line synchronization). Vertically ITU-R line numbers of the first field (see ITU-R-525 line numbering for 525 lines and for 625 lines), multiplied by two if the driver can capture both fields.

The top left corner, width and height of the source rectangle, that is the area actually sampled, is given by struct v4l2_crop using the same coordinate system as struct v4l2_cropcap. Applications can use the VIDIOC_G_CROP and VIDIOC_S_CROP ioctls to get and set this rectangle. It must lie completely within the capture boundaries and the driver may further adjust the requested size and/or position according to hardware limitations.

Each capture device has a default source rectangle, given by the defrect substructure of struct v4l2_cropcap. The center of this rectangle shall align with the center of the active picture area of the video signal, and cover what the driver writer considers the complete picture. Drivers shall reset the source rectangle to the default when the driver is first loaded, but not later.

For output devices these structures and ioctls are used accordingly, defining the target rectangle where the images will be inserted into the video signal.

Scaling Adjustments

Video hardware can have various cropping, insertion and scaling limitations. It may only scale up or down, support only discrete scaling factors, or have different scaling abilities in horizontal and vertical direction. Also it may not support scaling at all. At the same time the struct v4l2_crop rectangle may have to be aligned, and both the source and target rectangles may have arbitrary upper and lower size limits. In particular the maximum width and height in struct v4l2_crop may be smaller than the struct v4l2_cropcap.bounds area. Therefore, as usual, drivers are expected to adjust the requested parameters and return the actual values selected.

Applications can change the source or the target rectangle first, as they may prefer a particular image size or a certain area in the video signal. If the driver has to adjust both to satisfy hardware limitations, the last requested rectangle shall take priority, and the driver should preferably adjust the opposite one. The VIDIOC_TRY_FMT ioctl however shall not change the driver state and therefore only adjust the requested rectangle.

Suppose scaling on a video capture device is restricted to a factor 1:1 or 2:1 in either direction and the target image size must be a multiple of 16 × 16 pixels. The source cropping rectangle is set to defaults, which are also the upper limit in this example, of 640 × 400 pixels at offset 0, 0. An application requests an
image size of 300 × 225 pixels, assuming video will be scaled down from the “full picture” accordingly. The
driver sets the image size to the closest possible values 304 × 224, then chooses the cropping rectangle
closest to the requested size, that is 608 × 224 (224 × 2:1 would exceed the limit 400). The offset 0, 0
is still valid, thus unmodified. Given the default cropping rectangle reported by  
VIDIOC_CROPCAP  the
application can easily propose another offset to center the cropping rectangle.

Now the application may insist on covering an area using a picture aspect ratio closer to the original
request, so it asks for a cropping rectangle of 608 × 456 pixels. The present scaling factors limit cropping
to 640 × 384, so the driver returns the cropping size 608 × 384 and adjusts the image size to closest
possible 304 × 192.

Examples

Source and target rectangles shall remain unchanged across closing and reopening a device, such that
piping data into or out of a device will work without special preparations. More advanced applications
should ensure the parameters are suitable before starting I/O.

Note:

On the next two examples, a video capture device is assumed; change
V4L2_BUF_TYPE_VIDEO_CAPTURE for other types of device.

Example: Resetting the cropping parameters

```c
struct v4l2_cropcap cropcap;
struct v4l2_crop crop;

memset (&cropcap, 0, sizeof (cropcap));
cropcap.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
if (-1 != ioctl (fd, VIDIOC_CROPCAP, &cropcap)) {
    perror (“VIDIOC_CROPCAP”);
    exit (EXIT_FAILURE);
}
memset (&crop, 0, sizeof (crop));
crop.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
crop.c = cropcap.defrect;
/* Ignore if cropping is not supported (EINVAL). */
if (-1 == ioctl (fd, VIDIOC_S_CROP, &crop) && errno != EINVAL) {
    perror (“VIDIOC_S_CROP”);
    exit (EXIT_FAILURE);
}
```

Example: Simple downscaling

```c
struct v4l2_cropcap cropcap;
struct v4l2_format format;
reset_cropping_parameters ();
/* Scale down to 1/4 size of full picture. */
```
memset (&format, 0, sizeof (format)); /* defaults */

format.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;

format.fmt.pix.width = cropcap.defrect.width >> 1;
format.fmt.pix.height = cropcap.defrect.height >> 1;
format.fmt.pix.pixelformat = V4L2_PIX_FMT_YUYV;

if (-1 == ioctl (fd, VIDIOC_S_FMT, &format)) {
    perror ("VIDIOC_S_FORMAT");
    exit (EXIT_FAILURE);
}

/* We could check the actual image size now, the actual scaling factor
or if the driver can scale at all. */

Example: Selecting an output area

Note:
This example assumes an output device.

struct v4l2_cropcap cropcap;
struct v4l2_crop crop;

memset (&cropcap, 0, sizeof (cropcap));
cropcap.type = V4L2_BUF_TYPE_VIDEO_OUTPUT;

if (-1 == ioctl (fd, VIDIOC_CROPCAP, &cropcap)) {
    perror ("VIDIOC_CROPCAP");
    exit (EXIT_FAILURE);
}

memset (&crop, 0, sizeof (crop));
crop.type = V4L2_BUF_TYPE_VIDEO_OUTPUT;
crop.c = cropcap.defrect;

/* Scale the width and height to 50 % of their original size
and center the output. */

crop.c.width /= 2;
crop.c.height /= 2;
crop.c.left += crop.c.width / 2;
crop.c.top += crop.c.height / 2;

/* Ignore if cropping is not supported (EINVAL). */

if (-1 == ioctl (fd, VIDIOC_S_CROP, &crop)
    && errno != EINVAL) {
    perror ("VIDIOC_S_CROP");
    exit (EXIT_FAILURE);
}
Example: Current scaling factor and pixel aspect

**Note:**

This example assumes a video capture device.

```c
struct v4l2_cropcap cropcap;
struct v4l2_crop crop;
struct v4l2_format format;
double hscale, vscale;
double aspect;
int dwidth, dheight;

memset (&cropcap, 0, sizeof (cropcap));
cropcap.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
if (-1 == ioctl (fd, VIDIOC_CROPCAP, &cropcap)) {
    perror ("VIDIOC_CROPCAP");
    exit (EXIT_FAILURE);
}
memset (&crop, 0, sizeof (crop));
crop.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
if (-1 == ioctl (fd, VIDIOC_G_CROP, &crop)) {
    if (errno != EINVAL) {
        perror ("VIDIOC_G_CROP");
        exit (EXIT_FAILURE);
    }
    /* Cropping not supported. */
    crop.c = cropcap.defrect;
}
memset (&format, 0, sizeof (format));
format.fmt.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
if (-1 == ioctl (fd, VIDIOC_G_FMT, &format)) {
    perror ("VIDIOC_G_FMT");
    exit (EXIT_FAILURE);
}
/* The scaling applied by the driver. */
hscale = format.fmt.pix.width / (double) crop.c.width;
vscale = format.fmt.pix.height / (double) crop.c.height;
aspect = cropcap.pixelaspect.numerator /
    (double) cropcap.pixelaspect.denominator;
aspect = aspect * hscale / vscale;
/* Devices following ITU-R BT.601 do not capture square pixels. For playback on a computer monitor we should scale the images to this size. */
dwidth = format.fmt.pix.width / aspect;
dheight = format.fmt.pix.height;
```
API for cropping, composing and scaling

Introduction

Some video capture devices can sample a subsection of a picture and shrink or enlarge it to an image of arbitrary size. Next, the devices can insert the image into a larger one. Some video output devices can crop part of an input image, scale it up or down and insert it at an arbitrary scan line and horizontal offset into a video signal. We call these abilities cropping, scaling and composing.

On a video capture device the source is a video signal, and the cropping target determines the area actually sampled. The sink is an image stored in a memory buffer. The composing area specifies which part of the buffer is actually written to by the hardware.

On a video output device the source is an image in a memory buffer, and the cropping target is a part of an image to be shown on a display. The sink is the display or the graphics screen. The application may select the part of display where the image should be displayed. The size and position of such a window is controlled by the compose target.

Rectangles for all cropping and composing targets are defined even if the device does not support either cropping or composing. Their size and position will be fixed in such a case. If the device does not support scaling then the cropping and composing rectangles have the same size.

Selection targets

![Selection targets](image)

Fig. 1.3: Cropping and composing targets

Targets used by a cropping, composing and scaling process

See Selection targets for more information.

Configuration

Applications can use the selection API to select an area in a video signal or a buffer, and to query for default settings and hardware limits.

Video hardware can have various cropping, composing and scaling limitations. It may only scale up or down, support only discrete scaling factors, or have different scaling abilities in the horizontal and vertical directions. Also it may not support scaling at all. At the same time the cropping/composing rectangles may have to be aligned, and both the source and the sink may have arbitrary upper and lower size limits.
Therefore, as usual, drivers are expected to adjust the requested parameters and return the actual values selected. An application can control the rounding behaviour using constraint flags.

Configuration of video capture

See figure Cropping and composing targets for examples of the selection targets available for a video capture device. It is recommended to configure the cropping targets before to the composing targets.

The range of coordinates of the top left corner, width and height of areas that can be sampled is given by the V4L2_SEL_TGT_CROP_BOUNDS target. It is recommended for the driver developers to put the top/left corner at position \((0,0)\). The rectangle’s coordinates are expressed in pixels.

The top left corner, width and height of the source rectangle, that is the area actually sampled, is given by the V4L2_SEL_TGT_CROP target. It uses the same coordinate system as V4L2_SEL_TGT_CROP_BOUNDS. The active cropping area must lie completely inside the capture boundaries. The driver may further adjust the requested size and/or position according to hardware limitations.

Each capture device has a default source rectangle, given by the V4L2_SEL_TGT_CROP_DEFAULT target. This rectangle shall over what the driver writer considers the complete picture. Drivers shall set the active crop rectangle to the default when the driver is first loaded, but not later.

The composing targets refer to a memory buffer. The limits of composing coordinates are obtained using V4L2_SEL_TGT_COMPOSE_BOUNDS. All coordinates are expressed in pixels. The rectangle’s top/left corner must be located at position \((0,0)\). The width and height are equal to the image size set by VIDIOC_S_FMT.

The part of a buffer into which the image is inserted by the hardware is controlled by the V4L2_SEL_TGT_COMPOSE target. The rectangle’s coordinates are also expressed in the same coordinate system as the bounds rectangle. The composing rectangle must lie completely inside bounds rectangle. The driver must adjust the composing rectangle to fit to the bounding limits. Moreover, the driver can perform other adjustments according to hardware limitations. The application can control rounding behaviour using constraint flags.

For capture devices the default composing rectangle is queried using V4L2_SEL_TGT_COMPOSE_DEFAULT. It is usually equal to the bounding rectangle.

The part of a buffer that is modified by the hardware is given by V4L2_SEL_TGT_COMPOSE_PADDED. It contains all pixels defined using V4L2_SEL_TGT_COMPOSE plus all padding data modified by hardware during insertion process. All pixels outside this rectangle must not be changed by the hardware. The content of pixels that lie inside the padded area but outside active area is undefined. The application can use the padded and active rectangles to detect where the rubbish pixels are located and remove them if needed.

Configuration of video output

For output devices targets and ioctls are used similarly to the video capture case. The composing rectangle refers to the insertion of an image into a video signal. The cropping rectangles refer to a memory buffer. It is recommended to configure the composing targets before to the cropping targets.

The cropping targets refer to the memory buffer that contains an image to be inserted into a video signal or graphical screen. The limits of cropping coordinates are obtained using V4L2_SEL_TGT_CROP_BOUNDS. All coordinates are expressed in pixels. The top/left corner is always point \((0,0)\). The width and height is equal to the image size specified using VIDIOC_S_FMT ioctl.

The top left corner, width and height of the source rectangle, that is the area from which image date are processed by the hardware, is given by the V4L2_SEL_TGT_CROP. Its coordinates are expressed in in the same coordinate system as the bounds rectangle. The active cropping area must lie completely inside the crop boundaries and the driver may further adjust the requested size and/or position according to hardware limitations.

For output devices the default cropping rectangle is queried using V4L2_SEL_TGT_CROP_DEFAULT. It is usually equal to the bounding rectangle.
The part of a video signal or graphics display where the image is inserted by the hardware is controlled by `V4L2_SEL_TGT_COMPOSE` target. The rectangle’s coordinates are expressed in pixels. The composing rectangle must lie completely inside the bounds rectangle. The driver must adjust the area to fit to the bounding limits. Moreover, the driver can perform other adjustments according to hardware limitations.

The device has a default composing rectangle, given by the `V4L2_SEL_TGT_COMPOSE_DEFAULT` target. This rectangle shall cover what the driver writer considers the complete picture. It is recommended for the driver developers to put the top/left corner at position $(0,0)$. Drivers shall set the active composing rectangle to the default one when the driver is first loaded.

The devices may introduce additional content to video signal other than an image from memory buffers. It includes borders around an image. However, such a padded area is driver-dependent feature not covered by this document. Driver developers are encouraged to keep padded rectangle equal to active one. The padded target is accessed by the `V4L2_SEL_TGT_COMPOSE_PADDED` identifier. It must contain all pixels from the `V4L2_SEL_TGT_COMPOSE` target.

**Scaling control**

An application can detect if scaling is performed by comparing the width and the height of rectangles obtained using `V4L2_SEL_TGT_CROP` and `V4L2_SEL_TGT_COMPOSE` targets. If these are not equal then the scaling is applied. The application can compute the scaling ratios using these values.

**Comparison with old cropping API**

The selection API was introduced to cope with deficiencies of previous API, that was designed to control simple capture devices. Later the cropping API was adopted by video output drivers. The ioctl is used to select a part of the display where the video signal is inserted. It should be considered as an API abuse because the described operation is actually the composing. The selection API makes a clear distinction between composing and cropping operations by setting the appropriate targets. The `V4L2 API` lacks any support for composing to and cropping from an image inside a memory buffer. The application could configure a capture device to fill only a part of an image by abusing `V4L2 API`. Cropping a smaller image from a larger one is achieved by setting the field `bytesperline` at struct `v4l2_pix_format`. Introducing an image offsets could be done by modifying field `m_userptr` at struct `v4l2_buffer` before calling `ioctl VIDIOC_QBUF, VIDIOC_DQBUF`. Those operations should be avoided because they are not portable (endianness), and do not work for macroblock and Bayer formats and mmap buffers. The selection API deals with configuration of buffer cropping/composing in a clear, intuitive and portable way. Next, with the selection API the concepts of the padded target and constraints flags are introduced. Finally, struct `v4l2_crop` and struct `v4l2_cropcap` have no reserved fields. Therefore there is no way to extend their functionality. The new struct `v4l2_selection` provides a lot of place for future extensions. Driver developers are encouraged to implement only selection API. The former cropping API would be simulated using the new one.

**Examples**

(A video capture device is assumed; change `V4L2_BUF_TYPE_VIDEO_CAPTURE` for other devices; change target to `V4L2_SEL_TGT_COMPOSE_*` family to configure composing area)

**Example: Resetting the cropping parameters**

```c
struct v4l2_selection sel = {
    .type = V4L2_BUF_TYPE_VIDEO_CAPTURE,
    .target = V4L2_SEL_TGT_CROP_DEFAULT,
};
ret = ioctl(fd, VIDIOC_G_SELECTION, &sel);
if (ret)
```
exit(-1);

sel.target = V4L2_SEL_TGT_CROP;
ret = ioctl(fd, VIDIOC_S_SELECTION, &sel);
if (ret)
    exit(-1);

Setting a composing area on output of size of at most half of limit placed at a center of a display.

Example: Simple downscaling

```c
struct v4l2_selection sel = {
    .type = V4L2_BUF_TYPE_VIDEO_OUTPUT,
    .target = V4L2_SEL_TGT_COMPOSE_BOUNDS,
};
struct v4l2_rect r;

ret = ioctl(fd, VIDIOC_G_SELECTION, &sel);
if (ret)
    exit(-1);
/* setting smaller compose rectangle */
r.width = sel.r.width / 2;
r.height = sel.r.height / 2;
r.left = sel.r.width / 4;
r.top = sel.r.height / 4;
select = r;
set = V4L2_SEL_TGT_CROP;
set.flags = V4L2_SEL_FLAG_LE;
ret = ioctl(fd, VIDIOC_S_SELECTION, &sel);
if (ret)
    exit(-1);
```

A video output device is assumed; change V4L2_BUF_TYPE_VIDEO_OUTPUT for other devices

Example: Querying for scaling factors

```c
struct v4l2_selection compose = {
    .type = V4L2_BUF_TYPE_VIDEO_OUTPUT,
    .target = V4L2_SEL_TGT_COMPOSE,
};
struct v4l2_selection crop = {
    .type = V4L2_BUF_TYPE_VIDEO_OUTPUT,
    .target = V4L2_SEL_TGT_CROP,
};
double hscale, vscale;

ret = ioctl(fd, VIDIOC_G_SELECTION, &compose);
if (ret)
    exit(-1);
ret = ioctl(fd, VIDIOC_G_SELECTION, &crop);
if (ret)
    exit(-1);
/* computing scaling factors */
hscale = (double)compose.r.width / crop.r.width;
vscale = (double)compose.r.height / crop.r.height;
```
Streaming Parameters

Streaming parameters are intended to optimize the video capture process as well as I/O. Presently applications can request a high quality capture mode with the `VIDIOC_S_PARM` ioctl.

The current video standard determines a nominal number of frames per second. If less than this number of frames is to be captured or output, applications can request frame skipping or duplicating on the driver side. This is especially useful when using the `read()` or `write()`, which are not augmented by timestamps or sequence counters, and to avoid unnecessary data copying.

Finally these ioctls can be used to determine the number of buffers used internally by a driver in read/write mode. For implications see the section discussing the `read()` function.

To get and set the streaming parameters applications call the `VIDIOC_G_PARM` and `VIDIOC_S_PARM` ioctl, respectively. They take a pointer to a struct `v4l2_streamparm`, which contains a union holding separate parameters for input and output devices.

These ioctls are optional, drivers need not implement them. If so, they return the EINVAL error code.

1.2.2 Image Formats

The V4L2 API was primarily designed for devices exchanging image data with applications. The `struct v4l2_pix_format` and `struct v4l2_pix_format_mplane` structures define the format and layout of an image in memory. The former is used with the single-planar API, while the latter is used with the multi-planar version (see Single- and multi-planar APIs). Image formats are negotiated with the `VIDIOC_S_FMT` ioctl. (The explanations here focus on video capturing and output, for overlay frame buffer formats see also `VIDIOC_G_FBUF`.)

Single-planar format structure

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32 width</td>
<td>Image width in pixels.</td>
</tr>
<tr>
<td>__u32 height</td>
<td>Image height in pixels. If field is one of V4L2_FIELD_TOP, V4L2_FIELD_BOTTOM or V4L2_FIELD_ALTERNATE then height refers to the number of lines in the field, otherwise it refers to the number of lines in the frame (which is twice the field height for interlaced formats).</td>
</tr>
<tr>
<td>__u32 pixelformat</td>
<td>The pixel format or type of compression, set by the application. This is a little endian four character code. V4L2 defines standard RGB formats in Packed RGB Image Formats, YUV formats in YUV Formats, and reserved codes in Reserved Image Formats</td>
</tr>
</tbody>
</table>

Applications set these fields to request an image size, drivers return the closest possible values. In case of planar formats the width and height applies to the largest plane. To avoid ambiguities drivers must return values rounded up to a multiple of the scale factor of any smaller planes. For example when the image format is YUV 4:2:0, width and height must be multiples of two.

Table 1.1: struct v4l2_pix_format

Continued on next page
Both applications and drivers can set this field to request padding bytes at the end of each line. Drivers however may ignore the value requested by the application, returning width times bytes per pixel or a larger value required by the hardware. That implies applications can just set this field to zero to get a reasonable default.

Video hardware may access padding bytes, therefore they must reside in accessible memory. Consider cases where padding bytes after the last line of an image cross a system page boundary. Input devices may write padding bytes, the value is undefined. Output devices ignore the contents of padding bytes.

When the image format is planar the bytesperline value applies to the first plane and is divided by the same factor as the width field for the other planes. For example the Cb and Cr planes of a YUV 4:2:0 image have half as many padding bytes following each line as the Y plane. To avoid ambiguities drivers must return a bytesperline value rounded up to a multiple of the scale factor.

For compressed formats the bytesperline value makes no sense. Applications and drivers must set this to 0 in that case.

**Multi-planar format structures**

The struct v4l2_plane_pix_format structures define size and layout for each of the planes in a multi-planar format. The struct v4l2_pix_format_mplane structure contains information common to all planes (such as image width and height) and an array of struct v4l2_plane_pix_format structures, describing all planes of that format.

Standard Image Formats

In order to exchange images between drivers and applications, it is necessary to have standard image data formats which both sides will interpret the same way. V4L2 includes several such formats, and this section is intended to be an unambiguous specification of the standard image data formats in V4L2.

V4L2 drivers are not limited to these formats, however. Driver-specific formats are possible. In that case the application may depend on a codec to convert images to one of the standard formats when needed. But the data can still be stored and retrieved in the proprietary format. For example, a device may support a proprietary compressed format. Applications can still capture and save the data in the compressed format, saving much disk space, and later use a codec to convert the images to the X Windows screen format when the video is to be displayed.

Even so, ultimately, some standard formats are needed, so the V4L2 specification would not be complete without well-defined standard formats.

The V4L2 standard formats are mainly uncompressed formats. The pixels are always arranged in memory from left to right, and from top to bottom. The first byte of data in the image buffer is always for the leftmost pixel of the topmost row. Following that is the pixel immediately to its right, and so on until the end of the top row of pixels. Following the rightmost pixel of the row there may be zero or more bytes of padding to guarantee that each row of pixel data has a certain alignment. Following the pad bytes, if any, is data for the leftmost pixel of the second row from the top, and so on. The last row has just as many pad bytes after it as the other rows.
In V4L2 each format has an identifier which looks like PIX_FMT_XXX, defined in the videodev2.h header file. These identifiers represent four character (FourCC) codes which are also listed below, however they are not the same as those used in the Windows world.

For some formats, data is stored in separate, discontiguous memory buffers. Those formats are identified by a separate set of FourCC codes and are referred to as “multi-planar formats”. For example, a YUV422 frame is normally stored in one memory buffer, but it can also be placed in two or three separate buffers, with Y component in one buffer and CbCr components in another in the 2-planar version or with each component in its own buffer in the 3-planar case. Those sub-buffers are referred to as “planes”.

Colors

‘Color’ is a very complex concept and depends on physics, chemistry and biology. Just because you have three numbers that describe the ‘red’, ‘green’ and ‘blue’ components of the color of a pixel does not mean that you can accurately display that color. A colorspace defines what it actually means to have an RGB value of e.g. (255, 0, 0). That is, which color should be reproduced on the screen in a perfectly calibrated environment.

In order to do that we first need to have a good definition of color, i.e. some way to uniquely and unambiguously define a color so that someone else can reproduce it. Human color vision is trichromatic since the human eye has color receptors that are sensitive to three different wavelengths of light. Hence the need to use three numbers to describe color. Be glad you are not a mantis shrimp as those are sensitive to 12 different wavelengths, so instead of RGB we would be using the ABCDEFGHJKLM colorspace...

Color exists only in the eye and brain and is the result of how strongly color receptors are stimulated. This is based on the Spectral Power Distribution (SPD) which is a graph showing the intensity (radiant power) of the light at wavelengths covering the visible spectrum as it enters the eye. The science of colorimetry is about the relationship between the SPD and color as perceived by the human brain.

Since the human eye has only three color receptors it is perfectly possible that different SPDs will result in the same stimulation of those receptors and are perceived as the same color, even though the SPD of the light is different.

In the 1920s experiments were devised to determine the relationship between SPDs and the perceived color and that resulted in the CIE 1931 standard that defines spectral weighting functions that model the perception of color. Specifically that standard defines functions that can take an SPD and calculate the stimulus for each color receptor. After some further mathematical transforms these stimuli are known as the CIE XYZ tristimulus values and these X, Y and Z values describe a color as perceived by a human unambiguously. These X, Y and Z values are all in the range [0...1].

The Y value in the CIE XYZ colorspace corresponds to luminance. Often the CIE XYZ colorspace is transformed to the normalized CIE xyY colorspace:

\[
x = X / (X + Y + Z)
\]
\[
y = Y / (X + Y + Z)
\]

The x and y values are the chromaticity coordinates and can be used to define a color without the luminance component Y. It is very confusing to have such similar names for these colorspaces. Just be aware that if colors are specified with lower case ‘x’ and ‘y’, then the CIE xyY colorspace is used. Upper case ‘X’ and ‘Y’ refer to the CIE XYZ colorspace. Also, y has nothing to do with luminance. Together x and y specify a color, and Y the luminance. That is really all you need to remember from a practical point of view. At the end of this section you will find reading resources that go into much more detail if you are interested.

A monitor or TV will reproduce colors by emitting light at three different wavelengths, the combination of which will stimulate the color receptors in the eye and thus cause the perception of color. Historically these wavelengths were defined by the red, green and blue phosphors used in the displays. These color primaries are part of what defines a colorspace.

Different display devices will have different primaries and some primaries are more suitable for some display technologies than others. This has resulted in a variety of colorspaces that are used for different display technologies or uses. To define a colorspace you need to define the three color primaries (these are typically defined as x, y chromaticity coordinates from the CIE xyY colorspace) but also the white
reference: that is the color obtained when all three primaries are at maximum power. This determines the relative power or energy of the primaries. This is usually chosen to be close to daylight which has been defined as the CIE D65 Illuminant.

To recapitulate: the CIE XYZ colorspace uniquely identifies colors. Other colorspaces are defined by three chromaticity coordinates defined in the CIE xyY colorspace. Based on those a 3x3 matrix can be constructed that transforms CIE XYZ colors to colors in the new colorspace.

Both the CIE XYZ and the RGB colorspace that are derived from the specific chromaticity primaries are linear colorspaces. But neither the eye, nor display technology is linear. Doubling the values of all components in the linear colorspace will not be perceived as twice the intensity of the color. So each colorspace also defines a transfer function that takes a linear color component value and transforms it to the non-linear component value, which is a closer match to the non-linear performance of both the eye and displays. Linear component values are denoted RGB, non-linear are denoted as R'G'B'. In general colors used in graphics are all R'G'B', except in OpenGL which uses linear RGB. Special care should be taken when dealing with OpenGL to provide linear RGB colors or to use the built-in OpenGL support to apply the inverse transfer function.

The final piece that defines a colorspace is a function that transforms non-linear R'G'B' to non-linear Y'CbCr. This function is determined by the so-called luma coefficients. There may be multiple possible Y'CbCr encodings allowed for the same colorspace. Many encodings of color prefer to use luma (Y') and chroma (CbCr) instead of R'G'B'. Since the human eye is more sensitive to differences in luminance than in color this encoding allows one to reduce the amount of color information compared to the luma data. Note that the luma (Y') is unrelated to the Y in the CIE XYZ colorspace. Also note that Y'CbCr is often called YCbCr or YUV even though these are strictly speaking wrong.

Sometimes people confuse Y'CbCr as being a colorspace. This is not correct, it is just an encoding of an R'G'B' color into luma and chroma values. The underlying colorspace that is associated with the R'G'B' color is also associated with the Y'CbCr color.

The final step is how the RGB, R'G'B' or Y'CbCr values are quantized. The CIE XYZ colorspace where X, Y and Z are in the range [0...1] describes all colors that humans can perceive, but the transform to another colorspace will produce colors that are outside the [0...1] range. Once clamped to the [0...1] range those colors can no longer be reproduced in that colorspace. This clamping is what reduces the extent or gamut of the colorspace. How the range of [0...1] is translated to integer values in the range of [0...255] (or higher, depending on the color depth) is called the quantization. This is not part of the colorspace definition. In practice RGB or R'G'B' values are full range, i.e. they use the full [0...255] range. Y'CbCr values on the other hand are limited range with Y' using [16...235] and Cb and Cr using [16...240].

Unfortunately, in some cases limited range RGB is also used where the components use the range [16...235]. And full range Y'CbCr also exists using the [0...255] range.

In order to correctly interpret a color you need to know the quantization range, whether it is R'G'B' or Y'CbCr, the used Y'CbCr encoding and the colorspace. From that information you can calculate the corresponding CIEXYZ color and map that again to whatever colorspace your display device uses.

The colorspace definition itself consists of the three chromaticity primaries, the white reference chromaticity, a transfer function and the luma coefficients needed to transform R'G'B' to Y'CbCr. While some colorspace standards correctly define all four, quite often the colorspace standard only defines some, and you have to rely on other standards for the missing pieces. The fact that colorspaces are often a mix of different standards also led to very confusing naming conventions where the name of a standard was used to name a colorspace when in fact that standard was part of various other colorspaces as well.

If you want to read more about colors and colorspaces, then the following resources are useful: *poynton* is a good practical book for video engineers, *colimg* has a much broader scope and describes many more aspects of color (physics, chemistry, biology, etc.). The [http://www.brucelindbloom.com](http://www.brucelindbloom.com) website is an excellent resource, especially with respect to the mathematics behind colorspace conversions. The wikipedia [CIE 1931 colorspace](http://en.wikipedia.org/wiki/CIE_1931_colors) article is also very useful.
Defining Colors Spaces in V4L2

In V4L2 color spaces are defined by four values. The first is the colorspace identifier (enum `v4l2_colorspace`) which defines the chromaticities, the default transfer function, the default Y’CbCr encoding and the default quantization method. The second is the transfer function identifier (enum `v4l2_xfer_func`) to specify non-standard transfer functions. The third is the Y’CbCr encoding identifier (enum `v4l2_ycbcr_encoding`) to specify non-standard Y’CbCr encodings and the fourth is the quantization identifier (enum `v4l2_quantization`) to specify non-standard quantization methods. Most of the time only the colorspace field of struct `v4l2_pix_format` or struct `v4l2_pix_format_mplane` needs to be filled in.

Note:

The default R’G’B’ quantization is full range for all color spaces except for BT.2020 which uses limited range R’G’B’ quantization.

</table>

Detailed Colorspace Descriptions

Colorspace SMPTE 170M (V4L2_COLORSPACE_SMPTE170M)

The SMPTE 170M standard defines the colorspace used by NTSC and PAL and by SDTV in general. The default transfer function is V4L2_XFER_FUNC_709. The default Y’CbCr encoding is V4L2_YCBCR_ENC_601. The default Y’CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

Table 1.8: SMPTE 170M Chromaticities

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.630</td>
<td>0.340</td>
</tr>
<tr>
<td>Green</td>
<td>0.310</td>
<td>0.595</td>
</tr>
<tr>
<td>Blue</td>
<td>0.155</td>
<td>0.070</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

The red, green and blue chromaticities are also often referred to as the SMPTE C set, so this colorspace is sometimes called SMPTE C as well.

The transfer function defined for SMPTE 170M is the same as the one defined in Rec. 709.

\[
L' = -1.099(-L)^{0.45} + 0.099, \text{ for } L \leq -0.018
\]

\[
L' = 4.5L, \text{ for } -0.018 < L < 0.018
\]

\[
L' = 1.099L^{0.45} - 0.099, \text{ for } L \geq 0.018
\]
Inverse Transfer function:

\[ L = -\left( \frac{L' - 0.099}{-1.099} \right)^{\frac{1}{\gamma}}, \text{ for } L' \leq -0.081 \]

\[ L = \frac{L'}{4.5}, \text{ for } -0.081 < L' < 0.081 \]

\[ L = \left( \frac{L' + 0.099}{1.099} \right)^{\frac{1}{\gamma}}, \text{ for } L' \geq 0.081 \]

The luminance (Y') and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_601 encoding:

\[ Y' = 0.299R' + 0.587G' + 0.114B' \]

\[ Cb = -0.169R' - 0.331G' + 0.5B' \]

\[ Cr = 0.5R' - 0.419G' - 0.081B' \]

Y' is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. This conversion to Y’CbCr is identical to the one defined in the ITU_BT.601 standard and this colorspace is sometimes called BT.601 as well, even though BT.601 does not mention any color primaries.

The default quantization is limited range, but full range is possible although rarely seen.

**Colorsce Rec. 709 (V4L2_COLORSPACE_REC709)**

The ITU BT.709 standard defines the colorspace used by HDTV in general. The default transfer function is V4L2_XFER_FUNC_709. The default Y’CbCr encoding is V4L2_YCBCR_ENC_709. The default Y’CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.640</td>
<td>0.330</td>
</tr>
<tr>
<td>Green</td>
<td>0.300</td>
<td>0.600</td>
</tr>
<tr>
<td>Blue</td>
<td>0.150</td>
<td>0.060</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

The full name of this standard is Rec. ITU-R BT.709-5.

Transfer function. Normally L is in the range [0...1], but for the extended gamut xvYCC encoding values outside that range are allowed.

\[ L' = -1.099(-L)^{0.45} + 0.099, \text{ for } L \leq -0.018 \]

\[ L' = 4.5L, \text{ for } -0.018 < L < 0.018 \]

\[ L' = 1.099L^{0.45} - 0.099, \text{ for } L \geq 0.018 \]

Inverse Transfer function:

\[ L = -\left( \frac{L' - 0.099}{-1.099} \right)^{\frac{1}{\gamma}}, \text{ for } L' \leq -0.081 \]

\[ L = \frac{L'}{4.5}, \text{ for } -0.081 < L' < 0.081 \]

\[ L = \left( \frac{L' + 0.099}{1.099} \right)^{\frac{1}{\gamma}}, \text{ for } L' \geq 0.081 \]

The luminance (Y’) and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_709 encoding:

\[ Y' = 0.2126R' + 0.7152G' + 0.0722B' \]

\[ Cb = -0.1146R' - 0.3854G' + 0.5B' \]

\[ Cr = 0.5R' - 0.4542G' - 0.0458B' \]
Y' is clamped to the range [0…1] and Cb and Cr are clamped to the range [-0.5…0.5].

The default quantization is limited range, but full range is possible although rarely seen.

The V4L2_YCBCR_ENC_709 encoding described above is the default for this colorspace, but it can be overridden with V4L2_YCBCR_ENC_601, in which case the BT.601 Y’CbCr encoding is used.

Two additional extended gamut Y’CbCr encodings are also possible with this colorspace:

The xvYCC 709 encoding (V4L2_YCBCR_ENC_XV709, xvYCC ) is similar to the Rec. 709 encoding, but it allows for R’, G’ and B’ values that are outside the range [0…1]. The resulting Y’, Cb and Cr values are scaled and offset:

\[
\begin{align*}
Y' &= \frac{219}{256} \times (0.2126R' + 0.7152G' + 0.0722B') + \frac{16}{256} \\
Cb &= \frac{224}{256} \times (-0.1146R' - 0.3854G' + 0.5B') \\
Cr &= \frac{224}{256} \times (0.5R' - 0.4542G' - 0.0458B')
\end{align*}
\]

The xvYCC 601 encoding (V4L2_YCBCR_ENC_XV601, xvYCC ) is similar to the BT.601 encoding, but it allows for R’, G’ and B’ values that are outside the range [0…1]. The resulting Y’, Cb and Cr values are scaled and offset:

\[
\begin{align*}
Y' &= \frac{219}{256} \times (0.299R' + 0.587G' + 0.114B') + \frac{16}{256} \\
Cb &= \frac{224}{256} \times (-0.169R' - 0.331G' + 0.5B') \\
Cr &= \frac{224}{256} \times (0.5R' - 0.419G' - 0.081B')
\end{align*}
\]

Y’ is clamped to the range [0…1] and Cb and Cr are clamped to the range [-0.5…0.5]. The non-standard xvYCC 709 or xvYCC 601 encodings can be used by selecting V4L2_YCBCR_ENC_XV709 or V4L2_YCBCR_ENC_XV601. The xvYCC encodings always use full range quantization.

**Colorspace sRGB (V4L2_COLORSPACE_SRGB)**

The sRGB standard defines the colorspace used by most webcams and computer graphics. The default transfer function is V4L2_XFER_FUNC_SRGB. The default Y’CbCr encoding is V4L2_YCBCR_ENC_SYCC. The default Y’CbCr quantization is full range. The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.640</td>
<td>0.330</td>
</tr>
<tr>
<td>Green</td>
<td>0.300</td>
<td>0.600</td>
</tr>
<tr>
<td>Blue</td>
<td>0.150</td>
<td>0.060</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

These chromaticities are identical to the Rec. 709 colorspace.

Transfer function. Note that negative values for L are only used by the Y’CbCr conversion.

\[
\begin{align*}
L' &= -1.055(-L)^{1/3} + 0.055, \text{ for } L < -0.0031308 \\
L' &= 12.92L, \text{ for } -0.0031308 \leq L \leq 0.0031308 \\
L' &= 1.055L^{1/3} - 0.055, \text{ for } 0.0031308 < L \leq 1
\end{align*}
\]

Inverse Transfer function:

\[
\begin{align*}
L &= -((-L' + 0.055)/1.055)^{2/3}, \text{ for } L' < -0.04045 \\
L &= L'/12.92, \text{ for } -0.04045 \leq L' \leq 0.04045 \\
L &= ((L' + 0.055)/1.055)^{2/3}, \text{ for } L' > 0.04045
\end{align*}
\]
The luminance ($Y'$) and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_SYCC encoding as defined by \textit{sYCC}:

$$Y' = 0.2990R' + 0.5870G' + 0.1140B'$$

$$Cb = -0.1687R' - 0.3313G' + 0.5B'$$

$$Cr = 0.5R' - 0.4187G' - 0.0813B'$$

$Y'$ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. The V4L2_YCBCR_ENC_SYCC quantization is always full range. Although this Y’CbCr encoding looks very similar to the V4L2_YCBCR_ENC_XV601 encoding, it is not. The V4L2_YCBCR_ENC_XV601 scales and offsets the Y’CbCr values before quantization, but this encoding does not do that.

### Colorspace Adobe RGB (V4L2_COLORSPACE_ADOBERGB)

The \textit{AdobeRGB} standard defines the colorspace used by computer graphics that use the AdobeRGB colorspace. This is also known as the \textit{opRGB} standard. The default transfer function is V4L2_XFER_FUNC_ADOBERGB. The default Y’CbCr encoding is V4L2_YCBCR_ENC_601. The default Y’CbCr quantization is limited range. The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.6400</td>
<td>0.3300</td>
</tr>
<tr>
<td>Green</td>
<td>0.2100</td>
<td>0.7100</td>
</tr>
<tr>
<td>Blue</td>
<td>0.1500</td>
<td>0.0600</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

Transfer function:

$$L' = \frac{1}{L^{(2.19921875)}}$$

Inverse Transfer function:

$$L = L'^{(2.19921875)}$$

The luminance ($Y'$) and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_601 encoding:

$$Y' = 0.2990R' + 0.5870G' + 0.1140B'$$

$$Cb = -0.1699R' - 0.3313G' + 0.5B'$$

$$Cr = 0.5R' - 0.4199G' - 0.0813B'$$

$Y'$ is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. This transform is identical to one defined in SMPTE 170M/BT.601. The Y’CbCr quantization is limited range.

### Colorspace BT.2020 (V4L2_COLORSPACE_BT2020)

The \textit{ITU BT.2020} standard defines the colorspace used by Ultra-high definition television (UHDTV). The default transfer function is V4L2_XFER_FUNC_709. The default Y’CbCr encoding is V4L2_YCBCR_ENC_BT2020. The default R’G’B’ quantization is limited range (!), and so is the default Y’CbCr quantization. The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.708</td>
<td>0.292</td>
</tr>
<tr>
<td>Green</td>
<td>0.170</td>
<td>0.797</td>
</tr>
<tr>
<td>Blue</td>
<td>0.131</td>
<td>0.046</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>
Transfer function (same as Rec. 709):

\[
L' = 4.5L, \text{ for } 0 \leq L < 0.018 \\
L' = 1.099L^{0.45} - 0.099, \text{ for } 0.018 \leq L \leq 1
\]

Inverse Transfer function:

\[
L = L'/4.5, \text{ for } L' < 0.081 \\
L = \left(\frac{L' + 0.099}{1.099}\right)^{\frac{1}{0.45}}, \text{ for } L' \geq 0.081
\]

The luminance \((Y')\) and color difference \((Cb\) and \(Cr\)) are obtained with the following \texttt{V4L2\_YCBCR\_ENC\_BT2020} encoding:

\[
Y' = 0.2627R' + 0.6780G' + 0.0593B' \\
Cb = -0.1396R' - 0.3604G' + 0.5B' \\
Cr = 0.5R' - 0.4598G' - 0.0402B'
\]

\(Y'\) is clamped to the range \([0...1]\) and \(Cb\) and \(Cr\) are clamped to the range \([-0.5...0.5]\). The \(Y'CbCr\) quantization is limited range.

There is also an alternate constant luminance \(R'G'B'\) to \(Y'c'CbcCrc\) \texttt{(V4L2\_YCBCR\_ENC\_BT2020\_CONST\_LUM)} encoding:

Luma:

\[
Yc' = (0.2627R + 0.6780G + 0.0593B)' \\
B' - Yc' \leq 0: \\
\quad Cbc = (B' - Yc')/1.9404 \\
B' - Yc' > 0: \\
\quad Cbc = (B' - Yc')/1.5816 \\
R' - Yc' \leq 0: \\
\quad Crc = (R' - Y')/1.7184 \\
R' - Yc' > 0: \\
\quad Crc = (R' - Y')/0.9936
\]

\(Yc'\) is clamped to the range \([0...1]\) and \(Cbc\) and \(Crc\) are clamped to the range \([-0.5...0.5]\). The \(Yc'CbcCrc\) quantization is limited range.

**Colorspace DCI-P3** \texttt{(V4L2\_COLORSPACE\_DCI\_P3)}

The *SMPTE RP 431-2* standard defines the colorspace used by cinema projectors that use the DCI-P3 colorspace. The default transfer function is \texttt{V4L2\_XFER\_FUNC\_DCI\_P3}. The default \(Y'CbCr\) encoding is \texttt{V4L2\_YCBCR\_ENC\_709}.

**Note:**

*Note that this colorspace does not specify a \(Y'CbCr\) encoding since it is not meant to be encoded to \(Y'CbCr\). So this default \(Y'CbCr\) encoding was picked because it is the HDTV encoding. The default \(Y'CbCr\) quantization is limited range. The chromaticities of the primary colors and the white reference are:*

---

1.2. Part I - Video for Linux API
Table 1.13: DCI-P3 Chromaticities

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.6800</td>
<td>0.3200</td>
</tr>
<tr>
<td>Green</td>
<td>0.2650</td>
<td>0.6900</td>
</tr>
<tr>
<td>Blue</td>
<td>0.1500</td>
<td>0.0600</td>
</tr>
<tr>
<td>White Reference</td>
<td>0.3140</td>
<td>0.3510</td>
</tr>
</tbody>
</table>

Transfer function:

\[ L' = L^{1/3} \]

Inverse Transfer function:

\[ L = L'^{(2/6)} \]

Y’CbCr encoding is not specified. V4L2 defaults to Rec. 709.

**Colors space SMPT 240M (V4L2_COLORSPACE_SMPTE240M)**

The **SMPT 240M** standard was an interim standard used during the early days of HDTV (1988-1998). It has been superseded by Rec. 709. The default transfer function is V4L2_XFER_FUNC_SMPTE240M. The default Y’CbCr encoding is V4L2_YCBCR_ENC_SMPTE240M. The default Y’CbCr quantization is limited range.

The chromaticities of the primary colors and the white reference are:

Table 1.14: SMPT 240M Chromaticities

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.630</td>
<td>0.340</td>
</tr>
<tr>
<td>Green</td>
<td>0.310</td>
<td>0.595</td>
</tr>
<tr>
<td>Blue</td>
<td>0.155</td>
<td>0.070</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>

These chromaticities are identical to the SMPT 170M colorspace.

Transfer function:

\[ L' = 4L, \text{ for } 0 \leq L < 0.0228 \]
\[ L' = 1.1115L^{0.45} - 0.1115, \text{ for } 0.0228 \leq L \leq 1 \]

Inverse Transfer function:

\[ L = \frac{L'}{4}, \text{ for } 0 \leq L' < 0.0913 \]
\[ L = \left( \frac{L' + 0.1115}{1.1115} \right)^{\frac{2}{3}}, \text{ for } L' \geq 0.0913 \]

The luminance \((Y')\) and color difference \((Cb\) and \(Cr\)) are obtained with the following V4L2_YCBCR_ENC_SMPTE240M encoding:

\[ Y' = 0.2122R' + 0.7154G' + 0.0868B' \]
\[ Cb = -0.1161R' - 0.3843G' - 0.0754B' \]
\[ Cr = 0.5877R' - 0.2929G' - 0.1171B' \]

\(Y'\) is clamped to the range \([0...1]\) and \(Cbc\) and \(Crc\) are clamped to the range \([-0.5...0.5]\). The Y’CbCr quantization is limited range.
Colors'pace NTSC 1953 (V4L2_COLORSPACE_470_SYSTEM_M)

This standard defines the colorspace used by NTSC in 1953. In practice this colorspace is obsolete and SMPTE 170M should be used instead. The default transfer function is V4L2_XFER_FUNC_709. The default Y′CbCr encoding is V4L2_YCBCR_ENC_601. The default Y′CbcR quantization is limited range. The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.67</td>
<td>0.33</td>
</tr>
<tr>
<td>Green</td>
<td>0.21</td>
<td>0.71</td>
</tr>
<tr>
<td>Blue</td>
<td>0.14</td>
<td>0.08</td>
</tr>
<tr>
<td>White Reference (C)</td>
<td>0.310</td>
<td>0.316</td>
</tr>
</tbody>
</table>

Note:

This colors'pace uses Illuminant C instead of D65 as the white reference. To correctly convert an image in this colorspace to another that uses D65 you need to apply a chromatic adaptation algorithm such as the Bradford method.

The transfer function was never properly defined for NTSC 1953. The Rec. 709 transfer function is recommended in the literature:

\[ L' = 4.5L, \text{ for } 0 \leq L < 0.018 \]
\[ L' = 1.099L^{0.45} - 0.099, \text{ for } 0.018 \leq L \leq 1 \]

Inverse Transfer function:

\[ L = \frac{L'}{4.5}, \text{ for } L' < 0.081 \]
\[ L = \left( \frac{L' + 0.099}{1.099} \right)^{\frac{1}{0.45}}, \text{ for } L' \geq 0.081 \]

The luminance (Y′) and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_601 encoding:

\[ Y' = 0.299R' + 0.587G' + 0.114B' \]
\[ Cb = -0.169R' + 0.331G' + 0.587B' \]
\[ Cr = 0.5R' - 0.419G' - 0.081B' \]

Y′ is clamped to the range [0…1] and Cb and Cr are clamped to the range [-0.5…0.5]. The Y′CbcR quantization is limited range. This transform is identical to one defined in SMPTE 170M/BT.601.

Colors'pace EBU Tech. 3213 (V4L2_COLORSPACE_470_SYSTEM_BG)

The EBU Tech 3213 standard defines the colorspace used by PAL/SECAM in 1975. In practice this colorspace is obsolete and SMPTE 170M should be used instead. The default transfer function is V4L2_XFER_FUNC_709. The default Y′CbcR encoding is V4L2_YCBCR_ENC_601. The default Y′CbcR quantization is limited range. The chromaticities of the primary colors and the white reference are:

<table>
<thead>
<tr>
<th>Color</th>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0.64</td>
<td>0.33</td>
</tr>
<tr>
<td>Green</td>
<td>0.29</td>
<td>0.60</td>
</tr>
<tr>
<td>Blue</td>
<td>0.15</td>
<td>0.06</td>
</tr>
<tr>
<td>White Reference (D65)</td>
<td>0.3127</td>
<td>0.3290</td>
</tr>
</tbody>
</table>
The transfer function was never properly defined for this colorspace. The Rec. 709 transfer function is recommended in the literature:

\[
L' = 4.5L, \text{ for } 0 \leq L < 0.018 \\
L' = 1.099L^{0.45} - 0.099, \text{ for } 0.018 \leq L \leq 1
\]

Inverse Transfer function:

\[
L = \frac{L'}{4.5}, \text{ for } L' < 0.081 \\
L = \left(\frac{L' + 0.099}{1.099}\right)^{\frac{1}{0.45}}, \text{ for } L' \geq 0.081
\]

The luminance (Y') and color difference (Cb and Cr) are obtained with the following V4L2_YCBCR_ENC_601 encoding:

\[
Y' = 0.299R' + 0.587G' + 0.114B' \\
Cb = -0.169R' - 0.331G' + 0.5B' \\
Cr = 0.5R' - 0.419G' - 0.081B'
\]

Y' is clamped to the range [0...1] and Cb and Cr are clamped to the range [-0.5...0.5]. The Y’CbCr quantization is limited range. This transform is identical to one defined in SMPTE 170M/BT.601.

**Colorspace JPEG (V4L2_COLORSPACE_JPEG)**

This colorspace defines the colorspace used by most (Motion-)JPEG formats. The chromaticities of the primary colors and the white reference are identical to sRGB. The transfer function use is V4L2_XFER_FUNC_SRGB. The Y’CbCr encoding is V4L2_YCBCR_ENC_601 with full range quantization where Y' is scaled to [0...255] and Cb/Cr are scaled to [-128...128] and then clipped to [-128...127].

**Note:**

The JPEG standard does not actually store colorspace information. So if something other than sRGB is used, then the driver will have to set that information explicitly. Effectively V4L2_COLORSPACE_JPEG can be considered to be an abbreviation for V4L2_COLORSPACE_SRGB, V4L2_YCBCR_ENC_601 and V4L2_QUANTIZATION_FULL_RANGE.

**Detailed Transfer Function Descriptions**

**Transfer Function SMPTE 2084 (V4L2_XFER_FUNC_SMPTE2084)**

The SMPTE ST 2084 standard defines the transfer function used by High Dynamic Range content.

**Constants:**

\[
m1 = (2610 / 4096) / 4 \\
m2 = (2523 / 4096) * 128 \\
c1 = 3424 / 4096 \\
c2 = (2413 / 4096) * 32 \\
c3 = (2392 / 4096) * 32
\]

**Transfer function:**

\[
L' = ((c1 + c2 * L^{m1}) / (1 + c3 * L^{m1}))^{m2}
\]

**Inverse Transfer function:**

\[
L = \max(L^{1/m2} - c1, 0) / (c2 - c3 * L^{1/m2})^{1/m1}
\]
Indexed Format

In this format each pixel is represented by an 8 bit index into a 256 entry ARGB palette. It is intended for Video Output Overlays only. There are no ioctls to access the palette, this must be done with ioctls of the Linux framebuffer API.

RGB Formats

Packed RGB formats

Description

These formats are designed to match the pixel formats of typical PC graphics frame buffers. They occupy 8, 16, 24 or 32 bits per pixel. These are all packed-pixel formats, meaning all the data for a pixel lie next to each other in memory.

Table 1.18: Packed RGB Image Formats

Note:

Bit 7 is the most significant bit.

The usage and value of the alpha bits (a) in the ARGB and ABGR formats (collectively referred to as alpha formats) depend on the device type and hardware operation. Capture devices (including capture queues of mem-to-mem devices) fill the alpha component in memory. When the device outputs an alpha channel the alpha component will have a meaningful value. Otherwise, when the device doesn’t output an alpha channel but can set the alpha bit to a user-configurable value, the V4L2_CID_ALPHA_COMPONENT control is used to specify that alpha value, and the alpha component of all pixels will be set to the value specified by that control. Otherwise a corresponding format without an alpha component (XRGB or XBGR) must be used instead of an alpha format.

Output devices (including output queues of mem-to-mem devices and video output overlay devices)
read the alpha component from memory. When the device processes the alpha channel the alpha component must be filled with meaningful values by applications. Otherwise a corresponding format without an alpha component (XRGB or XBGR) must be used instead of an alpha format.

The XRGB and XBGR formats contain undefined bits (-). Applications, devices and drivers must ignore those bits, for both Video Capture Interface and Video Output Interface devices.

**Byte Order.** Each cell is one byte.

Formats defined in Deprecated Packed RGB Image Formats are deprecated and must not be used by new drivers. They are documented here for reference. The meaning of their alpha bits (a) is ill-defined and interpreted as in either the corresponding ARGB or XRGB format, depending on the driver.

A test utility to determine which RGB formats a driver actually supports is available from the LinuxTV v4l-dvb repository. See https://linuxtv.org/repo/ for access instructions.

### V4L2_PIX_FMT_SBGGR8 (‘BA81’)

Bayer RGB format

**Description**

This is commonly the native format of digital cameras, reflecting the arrangement of sensors on the CCD device. Only one red, green or blue value is given for each pixel. Missing components must be interpolated from neighbouring pixels. From left to right the first row consists of a blue and green value, the second row of a green and red value. This scheme repeats to the right and down for every two columns and rows.

**Byte Order.** Each cell is one byte.

<table>
<thead>
<tr>

</tbody>
</table>

### V4L2_PIX_FMT_SGBRG8 (‘GBRG’)

Bayer RGB format

**Description**

This is commonly the native format of digital cameras, reflecting the arrangement of sensors on the CCD device. Only one red, green or blue value is given for each pixel. Missing components must be interpolated...
from neighbouring pixels. From left to right the first row consists of a green and blue value, the second row of a red and green value. This scheme repeats to the right and down for every two columns and rows.

**Byte Order.** Each cell is one byte.

\[
\begin{array}{cccc}
\text{start + 0:} & G_00 & B_01 & G_02 & B_03 \\
\text{start + 4:} & R_10 & G_11 & R_12 & G_13 \\
\text{start + 8:} & G_20 & B_21 & G_22 & B_23 \\
\text{start + 12:} & R_30 & G_31 & R_32 & G_33 \\
\end{array}
\]

**V4L2_PIX_FMT_SGRBG8 ('GRBG')**

Bayer RGB format

**Description**

This is commonly the native format of digital cameras, reflecting the arrangement of sensors on the CCD device. Only one red, green or blue value is given for each pixel. Missing components must be interpolated from neighbouring pixels. From left to right the first row consists of a green and blue value, the second row of a red and green value. This scheme repeats to the right and down for every two columns and rows.

**Byte Order.** Each cell is one byte.

\[
\begin{array}{cccc}
\text{start + 0:} & G_00 & R_01 & G_02 & R_03 \\
\text{start + 4:} & B_10 & G_11 & B_12 & G_13 \\
\text{start + 8:} & G_20 & R_21 & G_22 & R_23 \\
\text{start + 12:} & B_30 & G_31 & B_32 & G_33 \\
\end{array}
\]

**V4L2_PIX_FMT_SRGGGB8 ('RGGB')**

Bayer RGB format

**Description**

This is commonly the native format of digital cameras, reflecting the arrangement of sensors on the CCD device. Only one red, green or blue value is given for each pixel. Missing components must be interpolated from neighbouring pixels. From left to right the first row consists of a red and green value, the second row of a green and blue value. This scheme repeats to the right and down for every two columns and rows.

**Byte Order.** Each cell is one byte.

\[
\begin{array}{cccc}
\text{start + 0:} & R_00 & G_01 & R_02 & G_03 \\
\text{start + 4:} & G_10 & B_11 & G_12 & B_13 \\
\text{start + 8:} & R_20 & G_21 & R_22 & G_23 \\
\text{start + 12:} & G_30 & B_31 & G_32 & B_33 \\
\end{array}
\]

**V4L2_PIX_FMT_SBGGR16 ('BYR2')**

Bayer RGB format

**Description**

This format is similar to **V4L2_PIX_FMT_SBGRG8**, except each pixel has a depth of 16 bits. The least significant byte is stored at lower memory addresses (little-endian).
The actual sampling precision may be lower than 16 bits, for example 10 bits per pixel with values in range 0 to 1023.

**Byte Order.** Each cell is one byte.

V4L2_PIX_FMT_SGRBG10 V4L2_PIX_FMT_SGBRG10 V4L2_PIX_FMT_SBGGR10 10-bit Bayer formats expanded to 16 bits

**Description**

These four pixel formats are raw sRGB / Bayer formats with 10 bits per colour. Each colour component is stored in a 16-bit word, with 6 unused high bits filled with zeros. Each n-pixel row contains n/2 green samples and n/2 blue or red samples, with alternating red and blue rows. Bytes are stored in memory in little endian order. They are conventionally described as GRGR... BGBG..., RGRG... GBGB..., etc. Below is an example of one of these formats.

**Byte Order.** Each cell is one byte.

V4L2_PIX_FMT_SGBRG10DPCM8 V4L2_PIX_FMT_SGRBG10DPCM8 V4L2_PIX_FMT_SRGGB10DPCM8 10-bit Bayer formats compressed to 8 bits

**Description**

These four pixel formats are raw sRGB / Bayer formats with 10 bits per colour compressed to 8 bits each, using DPCM compression. DPCM, differential pulse-code modulation, is lossy. Each colour component consumes 8 bits of memory. In other respects this format is similar to **V4L2_PIX_FMT_SRGGB10** ('RG10'), **V4L2_PIX_FMT_SGRGB10** ('BA10'), **V4L2_PIX_FMT_SGBRG10** ('GB10'), **V4L2_PIX_FMT_SBGGR10** ('BG10'),

**V4L2_PIX_FMT_SRGGB12** ('RG12'), **V4L2_PIX_FMT_SGRGB12** ('BA12'),
**V4L2_PIX_FMT_SGBRG12** ('GB12'), **V4L2_PIX_FMT_SBGGR12** ('BG12'),

V4L2_PIX_FMT_SGRGB12 V4L2_PIX_FMT_SGBRG12 V4L2_PIX_FMT_SBGGR12 12-bit Bayer formats expanded to 16 bits

**Description**

These four pixel formats are raw sRGB / Bayer formats with 12 bits per colour. Each colour component is stored in a 16-bit word, with 4 unused high bits filled with zeros. Each n-pixel row contains n/2 green samples and n/2 blue or red samples, with alternating red and blue rows. Bytes are stored in memory in little endian order. They are conventionally described as GRGR... BGBG..., RGRG... GBGB..., etc. Below is an example of one of these formats

**Byte Order.** Each cell is one byte, high 6 bits in high bytes are 0.

<table>
<thead>
<tr>
<th>start + 0:</th>
<th>B00low</th>
<th>B00high</th>
<th>G01low</th>
<th>G01high</th>
<th>B02low</th>
<th>B02high</th>
<th>G03low</th>
<th>G03high</th>

<td>R33high</td>
</tr>
</tbody>
</table>

**YUV Formats**

YUV is the format native to TV broadcast and composite video signals. It separates the brightness information (Y) from the color information (U and V or Cb and Cr). The color information consists of red and
blue color difference signals, this way the green component can be reconstructed by subtracting from the brightness component. See Colorspace for conversion examples. YUV was chosen because early television would only transmit brightness information. To add color in a way compatible with existing receivers a new signal carrier was added to transmit the color difference signals. Secondary in the YUV format the U and V components usually have lower resolution than the Y component. This is an analog video compression technique taking advantage of a property of the human visual system, being more sensitive to brightness information.

Packed YUV formats

Description

Similar to the packed RGB formats these formats store the Y, Cb and Cr component of each pixel in one 16 or 32 bit word.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Code</th>
<th>Byte 0 in memory</th>
<th>Byte 1</th>

</tbody>
</table>

Note:

1. Bit 7 is the most significant bit;
2. The value of a = alpha bits is undefined when reading from the driver, ignored when writing to the driver, except when alpha blending has been negotiated for a Video Overlay or Video Output Overlay.

V4L2_PIX_FMT_GREY ('GREY')

Grey-scale image

Description

This is a grey-scale image. It is really a degenerate Y’CbCr format which simply contains no Cb or Cr data.

Byte Order. Each cell is one byte.

<table>
<thead>
<tr>
<th>start + 0:</th>
<th>Y'00</th>
<th>Y'01</th>
<th>Y'02</th>
<th>Y'03</th>

<td>Y'33</td>
</tr>
</tbody>
</table>

V4L2_PIX_FMT_Y10 ('Y10 ')

Grey-scale image

Description

This is a grey-scale image with a depth of 10 bits per pixel. Pixels are stored in 16-bit words with unused high bits padded with 0. The least significant byte is stored at lower memory addresses (little-endian).
**Byte Order.** Each cell is one byte.

<table>
<thead>
<tr>
<th>start + 0:</th>
<th>Y'00low</th>
<th>Y'00high</th>
<th>Y'01low</th>

**V4L2_PIX_FMT_Y10BPACK ('Y10B')**

Grey-scale image as a bit-packed array

**Description**

This is a packed grey-scale image format with a depth of 10 bits per pixel. Pixels are stored in a bit-packed array of 10bit bits per pixel, with no padding between them and with the most significant bits coming first from the left.

**Bit-packed representation.**

pixels cross the byte boundary and have a ratio of 5 bytes for each 4 pixels.

\[
Y'_{00[9:2]} \quad Y'_{00[1:0]} \quad Y'_{01[9:4]} \quad Y'_{01[3:0]} \quad Y'_{02[9:6]} \quad Y'_{02[5:0]} \quad Y'_{03[9:8]} \quad Y'_{03[7:0]}
\]

**V4L2_PIX_FMT_Y16 ('Y16')**

Grey-scale image

**Description**

This is a grey-scale image with a depth of 16 bits per pixel. The least significant byte is stored at lower memory addresses (little-endian).

**Note:**

The actual sampling precision may be lower than 16 bits, for example 10 bits per pixel with values in range 0 to 1023.

**Byte Order.** Each cell is one byte.
V4L2_PIX_FMT_Y16_BE ('Y16 ' | (1 << 31))

Grey-scale image

Description

This is a grey-scale image with a depth of 16 bits per pixel. The most significant byte is stored at lower memory addresses (big-endian).

**Note:**

*The actual sampling precision may be lower than 16 bits, for example 10 bits per pixel with values in range 0 to 1023.*

**Byte Order.** Each cell is one byte.

```
| start + 0: | Y'00high | Y'00low | Y'01high | Y'01low | Y'02high | Y'02low | Y'03high | Y'03low |
| start + 8: | Y'10high | Y'10low | Y'11high | Y'11low | Y'12high | Y'12low | Y'13high | Y'13low |
| start + 16: | Y'20high | Y'20low | Y'21high | Y'21low | Y'22high | Y'22low | Y'23high | Y'23low |
| start + 24: | Y'30high | Y'30low | Y'31high | Y'31low | Y'32high | Y'32low | Y'33high | Y'33low |
```

V4L2_PIX_FMT_Y8I ('Y8I ')

Interleaved grey-scale image, e.g. from a stereo-pair

Description

This is a grey-scale image with a depth of 8 bits per pixel, but with pixels from 2 sources interleaved. Each pixel is stored in a 16-bit word. E.g. the R200 RealSense camera stores pixel from the left sensor in lower and from the right sensor in the higher 8 bits.

**Byte Order.** Each cell is one byte.

```
| start + 0: | Y'00left | Y'00right | Y'01left | Y'01right | Y'02left | Y'02right | Y'03left | Y'03right |
| start + 8: | Y'10left | Y'10right | Y'11left | Y'11right | Y'12left | Y'12right | Y'13left | Y'13right |
| start + 16: | Y'20left | Y'20right | Y'21left | Y'21right | Y'22left | Y'22right | Y'23left | Y'23right |
| start + 24: | Y'30left | Y'30right | Y'31left | Y'31right | Y'32left | Y'32right | Y'33left | Y'33right |
```

V4L2_PIX_FMT_Y12I ('Y12I ')

Interleaved grey-scale image, e.g. from a stereo-pair

Description

This is a grey-scale image with a depth of 12 bits per pixel, but with pixels from 2 sources interleaved and bit-packed. Each pixel is stored in a 24-bit word in the little-endian order. On a little-endian machine these pixels can be deinterlaced using
Bit-packed representation. pixels cross the byte boundary and have a ratio of 3 bytes for each inter-leaved pixel.

\[
\begin{array}{c|c|c|c}
Y'_{0\text{left}[7:0]} & Y'_{0\text{right}[3:0]} & Y'_{0\text{left}[11:8]} & Y'_{0\text{right}[11:4]} \\
\end{array}
\]

**V4L2_PIX_FMT_UV8** (**‘UV8’**)

UV plane interleaved

**Description**

In this format there is no Y plane, Only CbCr plane. ie (UV interleaved)

**Byte Order.** Each cell is one byte.

- **start + 0:** Cb00 Cb00 Cb01 Cr01
- **start + 4:** Cb10 Cb10 Cb11 Cr11
- **start + 8:** Cb20 Cb20 Cb21 Cr21
- **start + 12:** Cb30 Cb30 Cb31 Cr31

**V4L2_PIX_FMT_YUYV** (**‘YUYV’**)

Packed format with ½ horizontal chroma resolution, also known as YUV 4:2:2

**Description**

In this format each four bytes is two pixels. Each four bytes is two Y’s, a Cb and a Cr. Each Y goes to one of the pixels, and the Cb and Cr belong to both pixels. As you can see, the Cr and Cb components have half the horizontal resolution of the Y component. **V4L2_PIX_FMT_YUYV** is known in the Windows environment as YUY2.

**Byte Order.** Each cell is one byte.

- **start + 0:** Y'00 Cb00 Cb01 Cr01 Y'02 Cb02 Cb03 Cr03
- **start + 8:** Y'10 Cb10 Cb11 Cr11 Y'22 Cb22 Cb23 Cr23
- **start + 16:** Y'20 Cb20 Cb21 Cr21 Y'32 Cb32 Cb33 Cr33
- **start + 24:** Y'30 Cb30 Cb31 Cr31

**Color Sample Location..**

\[
\begin{array}{cccc}
0 & 1 & 2 & 3 \\
Y & Y & Y & Y \\
C & C & C & C \\
Y & Y & Y & Y \\
C & C & C & C \\
\end{array}
\]

**V4L2_PIX_FMT_UYVY** (**‘UYVY’**)

Variation of V4L2_PIX_FMT_YUYV with different order of samples in memory

1.2. Part I - Video for Linux API
Description

In this format each four bytes is two pixels. Each four bytes is two Y’s, a Cb and a Cr. Each Y goes to one of the pixels, and the Cb and Cr belong to both pixels. As you can see, the Cr and Cb components have half the horizontal resolution of the Y component.

**Byte Order.** Each cell is one byte.

V4L2_PIX_FMT_Y41P ('Y41P')

Format with ¼ horizontal chroma resolution, also known as YUV 4:1:1

Description

In this format each 12 bytes is eight pixels. In the twelve bytes are two CbCr pairs and eight Y’s. The first CbCr pair goes with the first four Y’s, and the second CbCr pair goes with the other four Y’s. The Cb and Cr components have one fourth the horizontal resolution of the Y component.

Do not confuse this format with V4L2_PIX_FMT_YUV411P. Y41P is derived from “YUV 4:1:1 packed”, while YUV411P stands for “YUV 4:1:1 planar”.

Byte Order. Each cell is one byte.

V4L2_PIX_FMT_YUV420 Planar formats with ½ horizontal and vertical chroma resolution, also known as YUV 4:2:0

Description

These are planar formats, as opposed to a packed format. The three components are separated into three sub- images or planes. The Y plane is first. The Y plane has one byte per pixel. For V4L2_PIX_FMT_YUV420, the Cr plane immediately follows the Y plane in memory. The Cr plane is half the width and half the height of the Y plane (and of the image). Each Cr belongs to four pixels, a two-by-two square of the image. For example, Cr0 belongs to Y’00, Y’01, Y’10, and Y’11. Following the Cr plane is the Cb plane, just like the Cr plane. V4L2_PIX_FMT_YUV420 is the same except the Cb plane comes first, then the Cr plane.

If the Y plane has pad bytes after each row, then the Cr and Cb planes have half as many pad bytes after their rows. In other words, two Cx rows (including padding) is exactly as long as one Y row (including padding).
Byte Order. Each cell is one byte.

| start + 0: | Y'00 | Y'01 | Y'02 | Y'03 |
| start + 4: | Y'10 | Y'11 | Y'12 | Y'13 |

V4L2_PIX_FMT_YUV420M (‘YM12’), V4L2_PIX_FMT_YVU420M (‘YM21’)

V4L2_PIX_FMT_YUV420M Variation of V4L2_PIX_FMT_YUV420 and V4L2_PIX_FMT_YVU420 with planes non contiguous in memory.

Description

This is a multi-planar format, as opposed to a packed format. The three components are separated into three sub-images or planes.

The Y plane is first. The Y plane has one byte per pixel. For V4L2_PIX_FMT_YUV420M the Cb data constitutes the second plane which is half the width and half the height of the Y plane (and of the image). Each Cb belongs to four pixels, a two-by-two square of the image. For example, Cb0 belongs to Y'00, Y'01, Y'10, and Y'11. The Cr data, just like the Cb plane, is in the third plane.

V4L2_PIX_FMT_YUV420M is the same except the Cr data is stored in the second plane and the Cb data in the third plane.

If the Y plane has pad bytes after each row, then the Cb and Cr planes have half as many pad bytes after their rows. In other words, two Cx rows (including padding) is exactly as long as one Y row (including padding).

V4L2_PIX_FMT_YUV420M and V4L2_PIX_FMT_YVU420M are intended to be used only in drivers and applications that support the multi-planar API, described in Single- and multi-planar APIs.

Byte Order. Each cell is one byte.

| start0 + 0: | Y'00 | Y'01 | Y'02 | Y'03 |
| start0 + 4: | Y'10 | Y'11 | Y'12 | Y'13 |

**V4L2_PIX_FMT_YUV422M ('YM16'), V4L2_PIX_FMT_YVU422M ('YM61')**

V4L2_PIX_FMT_YUV422M Planar formats with ½ horizontal resolution, also known as YUV and YVU 4:2:2

**Description**

This is a multi-planar format, as opposed to a packed format. The three components are separated into three sub-images or planes.

The Y plane is first. The Y plane has one byte per pixel. For V4L2_PIX_FMT_YUV422M the Cb data constitutes the second plane which is half the width of the Y plane (and of the image). Each Cb belongs to two pixels. For example, Cb₀ belongs to Y'₀₀, Y'₀₁. The Cr data, just like the Cb plane, is in the third plane.

V4L2_PIX_FMT_YUV422M is the same except the Cr data is stored in the second plane and the Cb data in the third plane.

If the Y plane has pad bytes after each row, then the Cb and Cr planes have half as many pad bytes after their rows. In other words, two Cx rows (including padding) is exactly as long as one Y row (including padding).

V4L2_PIX_FMT_YUV422M and V4L2_PIX_FMT_YVU422M are intended to be used only in drivers and applications that support the multi-planar API, described in *Single- and multi-planar APIs*.

**Byte Order.** Each cell is one byte.

V4L2_PIX_FMT_YUV444M (‘YM24’), V4L2_PIX_FMT_YVU444M (‘YM42’)

V4L2_PIX_FMT_YUV444M Planar formats with full horizontal resolution, also known as YUV and YVU 4:4:4

Description

This is a multi-planar format, as opposed to a packed format. The three components are separated into three sub-images or planes.

The Y plane is first. The Y plane has one byte per pixel. For V4L2_PIX_FMT_YUV444M the Cb data constitutes the second plane which is the same width and height as the Y plane (and as the image). The Cr data, just like the Cb plane, is in the third plane.

V4L2_PIX_FMT_YVU444M is the same except the Cr data is stored in the second plane and the Cb data in the third plane.

If the Y plane has pad bytes after each row, then the Cb and Cr planes have the same number of pad bytes after their rows.

V4L2_PIX_FMT_YUV444M and V4L2_PIX_FMT_YVU444M are intended to be used only in drivers and applications that support the multi-planar API, described in Single- and multi-planar APIs.

Byte Order. Each cell is one byte.

**Color Sample Location..**
Format with \( \frac{1}{4} \) horizontal chroma resolution, also known as YUV 4:1:1. Planar layout as opposed to V4L2_PIX_FMT_YUV411P

**Description**

This format is not commonly used. This is a planar format similar to the 4:2:2 planar format except with half as many chroma. The three components are separated into three sub-images or planes. The Y plane is first. The Y plane has one byte per pixel. The Cb plane immediately follows the Y plane in memory. The Cb plane is \( \frac{1}{4} \) the width of the Y plane (and of the image). Each Cb belongs to 4 pixels all on the same row. For example, Cb\(_0\) belongs to Y\(_{00}\), Y\(_{01}\), Y\(_{02}\) and Y\(_{03}\). Following the Cb plane is the Cr plane, just like the Cb plane.

If the Y plane has pad bytes after each row, then the Cr and Cb planes have \( \frac{1}{4} \) as many pad bytes after their rows. In other words, four C x rows (including padding) is exactly as long as one Y row (including padding).

**Byte Order.** Each cell is one byte.

V4L2_PIX_FMT_NV12 (‘NV12’), V4L2_PIX_FMT_NV21 (‘NV21’)

V4L2_PIX_FMT_NV21 Formats with \( \frac{1}{2} \) horizontal and vertical chroma resolution, also known as YUV 4:2:0. One luminance and one chrominance plane with alternating chroma samples as opposed to V4L2_PIX_FMT_YVU420
Description

These are two-plane versions of the YUV 4:2:0 format. The three components are separated into two sub-images or planes. The Y plane is first. The Y plane has one byte per pixel. For V4L2_PIX_FMT_NV12, a combined CbCr plane immediately follows the Y plane in memory. The CbCr plane is the same width, in bytes, as the Y plane (and of the image), but is half as tall in pixels. Each CbCr pair belongs to four pixels. For example, Cb0/Cr0 belongs to Y'00, Y'01, Y'10, Y'11. V4L2_PIX_FMT_NV21 is the same except the Cb and Cr bytes are swapped, the CrCb plane starts with a Cr byte.

If the Y plane has pad bytes after each row, then the CbCr plane has as many pad bytes after its rows.

Byte Order. Each cell is one byte.

V4L2_PIX_FMT_NV12M ('NM12'), V4L2_PIX_FMT_NV21M ('NM21'), V4L2_PIX_FMT_NV12MT_16X16

Description

This is a multi-planar, two-plane version of the YUV 4:2:0 format. The three components are separated into two sub-images or planes. V4L2_PIX_FMT_NV12M differs from V4L2_PIX_FMT_NV12 in that the two planes are non-contiguous in memory, i.e. the chroma plane do not necessarily immediately follows the luma plane. The luminance data occupies the first plane. The Y plane has one byte per pixel. In the second plane there is a chrominance data with alternating chroma samples. The CbCr plane is the same width, in bytes, as the Y plane (and of the image), but is half as tall in pixels. Each CbCr pair belongs to four pixels. For example, Cb0/Cr0 belongs to Y'00, Y'01, Y'10, Y'11. V4L2_PIX_FMT_NV12MT_16X16 is the tiled version of V4L2_PIX_FMT_NV12M with 16x16 macroblock tiles. Here pixels are arranged in 16x16 2D tiles and tiles are arranged in linear order in memory. V4L2_PIX_FMT_NV21M is the same as V4L2_PIX_FMT_NV12M except the Cb and Cr bytes are swapped, the CrCb plane starts with a Cr byte.

V4L2_PIX_FMT_NV12M is intended to be used only in drivers and applications that support the multi-planar API, described in Single- and multi-planar APIs.

If the Y plane has pad bytes after each row, then the CbCr plane has as many pad bytes after its rows.

Byte Order. Each cell is one byte.
**V4L2_PIX_FMT_NV12MT (‘TM12’)**

Formats with ½ horizontal and vertical chroma resolution. This format has two planes - one for luminance and one for chrominance. Chroma samples are interleaved. The difference to V4L2_PIX_FMT_NV12 is the memory layout. Pixels are grouped in macroblocks of 64x32 size. The order of macroblocks in memory is also not standard.

**Description**

This is the two-plane versions of the YUV 4:2:0 format where data is grouped into 64x32 macroblocks. The three components are separated into two sub-images or planes. The Y plane has one byte per pixel and pixels are grouped into 64x32 macroblocks. The CbCr plane has the same width, in bytes, as the Y plane (and the image), but is half as tall in pixels. The chroma plane is also grouped into 64x32 macroblocks.

Width of the buffer has to be aligned to the multiple of 128, and height alignment is 32. Every four adjacent buffers - two horizontally and two vertically are grouped together and are located in memory in Z or flipped Z order.

Layout of macroblocks in memory is presented in the following figure.

![Fig. 1.4: V4L2_PIX_FMT_NV12MT macroblock Z shape memory layout](image)

The requirement that width is multiple of 128 is implemented because, the Z shape cannot be cut in half horizontally. In case the vertical resolution of macroblocks is odd then the last row of macroblocks is arranged in a linear order.

In case of chroma the layout is identical. Cb and Cr samples are interleaved. Height of the buffer is aligned to 32.

Memory layout of macroblocks of V4L2_PIX_FMT_NV12MT format in most extreme case.
V4L2_PIX_FMT_NV16 ('NV16'), V4L2_PIX_FMT_NV61 ('NV61')

V4L2_PIX_FMT_NV61 Formats with ½ horizontal chroma resolution, also known as YUV 4:2:2. One luminance and one chrominance plane with alternating chroma samples as opposed to V4L2_PIX_FMT_YVU420

Description

These are two-plane versions of the YUV 4:2:2 format. The three components are separated into two sub-images or planes. The Y plane is first. The Y plane has one byte per pixel. For V4L2_PIX_FMT_NV16, a combined CbCr plane immediately follows the Y plane in memory. The CbCr plane is the same width and height, in bytes, as the Y plane (and of the image). Each CbCr pair belongs to two pixels. For example, Cb0/Cr0 belongs to Y’00, Y’01. V4L2_PIX_FMT_NV61 is the same except the Cb and Cr bytes are swapped, the CrCb plane starts with a Cr byte.

If the Y plane has pad bytes after each row, then the CbCr plane has as many pad bytes after its rows.

Byte Order. Each cell is one byte.

| start + 0: Y’00 | Y’01 | Y’02 | Y’03 |
| start + 4: Y’10 | Y’11 | Y’12 | Y’13 |
| start + 8: Y’20 | Y’21 | Y’22 | Y’23 |

| start + 24: Cb20 | Cr20 | Cb21 | Cr21 |
| start + 28: Cb30 | Cr30 | Cb31 | Cr31 |

Color Sample Location..
V4L2_PIX_FMT_NV16M ('NM16'), V4L2_PIX_FMT_NV61M ('NM61')

V4L2_PIX_FMT_NV61M Variation of V4L2_PIX_FMT_NV16 and V4L2_PIX_FMT_NV61 with planes non contiguous in memory.

Description

This is a multi-planar, two-plane version of the YUV 4:2:2 format. The three components are separated into two sub-images or planes. V4L2_PIX_FMT_NV16M differs from V4L2_PIX_FMT_NV16 in that the two planes are non-contiguous in memory, i.e. the chroma plane does not necessarily immediately follow the luma plane. The luminance data occupies the first plane. The Y plane has one byte per pixel. In the second plane there is chrominance data with alternating chroma samples. The CbCr plane is the same width and height, in bytes, as the Y plane. Each CbCr pair belongs to two pixels. For example, Cb0/Cr0 belongs to Y'00, Y'01. V4L2_PIX_FMT_NV61M is the same as V4L2_PIX_FMT_NV16M except the Cb and Cr bytes are swapped, the CrCb plane starts with a Cr byte.

V4L2_PIX_FMT_NV16M and V4L2_PIX_FMT_NV61M are intended to be used only in drivers and applications that support the multi-planar API, described in Single-and-multi-planar APIs.

Byte Order. Each cell is one byte.

V4L2_PIX_FMT_NV24 ('NV24'), V4L2_PIX_FMT_NV42 ('NV42')

V4L2_PIX_FMT_NV42 Formats with full horizontal and vertical chroma resolutions, also known as YUV 4:4:4. One luminance and one chrominance plane with alternating chroma samples as opposed to V4L2_PIX_FMT_YUV420

Description

These are two-plane versions of the YUV 4:4:4 format. The three components are separated into two sub-images or planes. The Y plane is first, with each Y sample stored in one byte per pixel. For V4L2_PIX_FMT_NV24, a combined CbCr plane immediately follows the Y plane in memory. The CbCr plane has the same width and height, in pixels, as the Y plane (and the image). Each line contains one CbCr pair per pixel, with each Cb and Cr sample stored in one byte. V4L2_PIX_FMT_NV42 is the same except that the Cb and Cr samples are swapped, the CrCb plane starts with a Cr sample.

If the Y plane has pad bytes after each row, then the CbCr plane has twice as many pad bytes after its rows.

Byte Order. Each cell is one byte.

V4L2_PIX_FMT_M420 ('M420')

Format with ½ horizontal and vertical chroma resolution, also known as YUV 4:2:0. Hybrid plane line-interleaved layout.

Description

M420 is a YUV format with ½ horizontal and vertical chroma subsampling (YUV 4:2:0). Pixels are organized as interleaved luma and chroma planes. Two lines of luma data are followed by one line of chroma data.

The luma plane has one byte per pixel. The chroma plane contains interleaved CbCr pixels subsampled by ½ in the horizontal and vertical directions. Each CbCr pair belongs to four pixels. For example, Cb0/Cr0 belongs to Y'00, Y'01, Y'10, Y'11.

All line lengths are identical: if the Y lines include pad bytes so do the CbCr lines.

Byte Order. Each cell is one byte.

Color Sample Location..
Depth Formats

Depth data provides distance to points, mapped onto the image plane

V4L2_PIX_FMT_Z16 (‘Z16’)

16-bit depth data with distance values at each pixel

Description

This is a 16-bit format, representing depth data. Each pixel is a distance to the respective point in the image coordinates. Distance unit can vary and has to be negotiated with the device separately. Each pixel is stored in a 16-bit word in the little endian byte order.

Byte Order. Each cell is one byte.

| start + 0: | Z00low | Z00high | Z01low | Z01high | Z02low | Z02high | Z03low | Z03high |
| start + 8: | Z10low | Z10high | Z11low | Z11high | Z12low | Z12high | Z13low | Z13high |

SDR Formats

These formats are used for SDR interface only.

**V4L2_SDR_FMT_CU8 (‘CU08’)***

Complex unsigned 8-bit IQ sample

**Description**

This format contains sequence of complex number samples. Each complex number consist two parts, called In-phase and Quadrature (IQ). Both I and Q are represented as a 8 bit unsigned number. I value comes first and Q value after that.

**Byte Order.** Each cell is one byte.

\[
\begin{align*}
\text{start + 0:} & \quad I_0 \\
\text{start + 1:} & \quad Q_0
\end{align*}
\]
**V4L2_SDR_FMT_CU16LE (‘CU16’)**

Complex unsigned 16-bit little endian IQ sample

**Description**

This format contains sequence of complex number samples. Each complex number consist two parts, called In-phase and Quadrature (IQ). Both I and Q are represented as a 16 bit unsigned little endian number. I value comes first and Q value after that.

**Byte Order.** Each cell is one byte.

| Start + 0: | I'_{0[7:0]} | I'_{0[15:8]} |
| Start + 2: | Q'_{0[7:0]} | Q'_{0[15:8]} |

**V4L2_SDR_FMT_CS8 (‘CS08’)**

Complex signed 8-bit IQ sample

**Description**

This format contains sequence of complex number samples. Each complex number consist two parts, called In-phase and Quadrature (IQ). Both I and Q are represented as a 8 bit signed number. I value comes first and Q value after that.

**Byte Order.** Each cell is one byte.

| Start + 0: | I'_{0} |
| Start + 1: | Q'_{0} |

**V4L2_SDR_FMT_CS14LE (‘CS14’)**

Complex signed 14-bit little endian IQ sample

**Description**

This format contains sequence of complex number samples. Each complex number consist two parts, called In-phase and Quadrature (IQ). Both I and Q are represented as a 14 bit signed little endian number. I value comes first and Q value after that. 14 bit value is stored in 16 bit space with unused high bits padded with 0.

**Byte Order.** Each cell is one byte.

| Start + 0: | I'_{0[7:0]} | I'_{0[13:8]} |
| Start + 2: | Q'_{0[7:0]} | Q'_{0[13:8]} |

**V4L2_SDR_FMT RU12LE (‘RU12’)**

Real unsigned 12-bit little endian sample
Description

This format contains sequence of real number samples. Each sample is represented as a 12 bit unsigned little endian number. Sample is stored in 16 bit space with unused high bits padded with 0.

Byte Order. Each cell is one byte.

```
start + 0:  I'0[7:0]   I'0[11:8]
```

Reserved Format Identifiers

These formats are not defined by this specification, they are just listed for reference and to avoid naming conflicts. If you want to register your own format, send an e-mail to the linux-media mailing list https://linuxtvt.org/lists.php for inclusion in the videodev2.h file. If you want to share your format with other developers add a link to your documentation and send a copy to the linux-media mailing list for inclusion in this section. If you think your format should be listed in a standard format section please make a proposal on the linux-media mailing list.

<td>‘SSCI’</td>
<td>Two-planar format used by Samsung S5C73MX cameras. The first plane contains interleaved JPEG and UYVY image data, followed by meta data in form of an array of offsets to the UYVY data blocks. The actual pointer array follows immediately the interleaved JPEG/UYVY data, the number of entries in this array equals the height of the UYVY image. Each entry is a 4-byte unsigned integer in big endian order and it’s an offset to a single pixel line of the UYVY image. The first plane can start either with JPEG or UYVY data chunk. The size of a single UYVY block equals the UYVY image’s width multiplied by 2. The size of a JPEG chunk depends on the image and can vary with each line. The second plane, at an offset of 4084 bytes, contains a 4-byte offset to the pointer array in the first plane. This offset is followed by a 4-byte value indicating size of the pointer array. All numbers in the second plane are also in big endian order. Remaining data in the second plane is undefined. The information in the second plane allows to easily find location of the pointer array, which can be different for each frame. The size of the pointer array is constant for given UYVY image height. In order to extract UYVY and JPEG frames an application can initially set a data pointer to the start of first plane and then add an offset from the first entry of the pointers table. Such a pointer indicates start of an UYVY image pixel line. Whole UYVY line can be copied to a separate buffer. These steps should be repeated for each line, i.e. the number of entries in the pointer array. Anything what’s in between the UYVY lines is JPEG data and should be concatenated to form the JPEG stream.</td>

### 1.2.3 Input/Output

The V4L2 API defines several different methods to read from or write to a device. All drivers exchanging data with applications must support at least one of them.

The classic I/O method using the `read()` and `write()` function is automatically selected after opening a V4L2 device. When the driver does not support this method attempts to read or write will fail at any time.

Other methods must be negotiated. To select the streaming I/O method with memory mapped or user buffers applications call the `ioctl VIDIOC_REQBUFS` ioctl. The asynchronous I/O method is not defined yet.

Video overlay can be considered another I/O method, although the application does not directly receive the image data. It is selected by initiating video overlay with the `VIDIOC_S_FMT` ioctl. For more information see [Video Overlay Interface](#).

Generally exactly one I/O method, including overlay, is associated with each file descriptor. The only exceptions are applications not exchanging data with a driver (“panel applications”, see [Opening and Closing Devices](#)) and drivers permitting simultaneous video capturing and overlay using the same file descriptor, for compatibility with V4L and earlier versions of V4L2.

VIDIOC_S_FMT and `ioctl VIDIOC_REQBUFS` would permit this to some degree, but for simplicity drivers need not support switching the I/O method (after first switching away from read/write) other than by closing and reopening the device.

The following sections describe the various I/O methods in more detail.

### Read/Write

Input and output devices support the `read()` and `write()` function, respectively, when the V4L2_CAP_READWRITE flag in the capabilities field of struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl is set.

Drivers may need the CPU to copy the data, but they may also support DMA to or from user memory, so this I/O method is not necessarily less efficient than other methods merely exchanging buffer pointers. It is considered inferior though because no meta-information like frame counters or timestamps are passed. This information is necessary to recognize frame dropping and to synchronize with other data streams. However this is also the simplest I/O method, requiring little or no setup to exchange data. It permits command line stunts like this (the vidctrl tool is fictitious):

```
$ vidctrl /dev/video --input=0 --format=YUYV --size=352x288
$ dd if=/dev/video of=myimage.422 bs=202752 count=1
```

To read from the device applications use the `read()` function, to write the `write()` function. Drivers must implement one I/O method if they exchange data with applications, but it need not be this. When reading or writing is supported, the driver must also support the `select()` and `poll()` function.  

1 It would be desirable if applications could depend on drivers supporting all I/O interfaces, but as much as the complex memory mapping I/O can be inadequate for some devices we have no reason to require this interface, which is most useful for simple applications capturing still images.

2 At the driver level `select()` and `poll()` are the same, and `select()` is too important to be optional.
Streaming I/O (Memory Mapping)

Input and output devices support this I/O method when the V4L2_CAP_STREAMING flag in the capabilities field of struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl is set. There are two streaming methods, to determine if the memory mapping flavor is supported applications must call the `ioctl VIDIOC_REQBUFS` ioctl with the memory type set to V4L2_MEMORY_MMAP.

Streaming is an I/O method where only pointers to buffers are exchanged between application and driver, the data itself is not copied. Memory mapping is primarily intended to map buffers in device memory into the application’s address space. Device memory can be for example the video memory on a graphics card with a video capture add-on. However, being the most efficient I/O method available for a long time, many other drivers support streaming as well, allocating buffers in DMA-able main memory.

A driver can support many sets of buffers. Each set is identified by a unique buffer type value. The sets are independent and each set can hold a different type of data. To access different sets at the same time different file descriptors must be used. ¹

To allocate device buffers applications call the `ioctl VIDIOC_REQBUFS` ioctl with the desired number of buffers and buffer type, for example V4L2_BUF_TYPE_VIDEO_CAPTURE. This ioctl can also be used to change the number of buffers or to free the allocated memory, provided none of the buffers are still mapped.

Before applications can access the buffers they must map them into their address space with the `mmap()` function. The location of the buffers in device memory can be determined with the `ioctl VIDIOC_QUERYBUF` ioctl. In the single-planar API case, the m.offset and length returned in a struct `v4l2_buffer` are passed as sixth and second parameter to the `mmap()` function. When using the multi-planar API, struct `v4l2_buffer` contains an array of struct `v4l2_plane` structures, each containing its own m.offset and length. When using the multi-planar API, every plane of every buffer has to be mapped separately, so the number of calls to `mmap()` should be equal to number of buffers times number of planes in each buffer. The offset and length values must not be modified. Remember, the buffers are allocated in physical memory, as opposed to virtual memory, which can be swapped out to disk. Applications should free the buffers as soon as possible with the `munmap()` function.

Example: Mapping buffers in the single-planar API

```
struct v4l2_requestbuffers reqbuf;
struct {
    void *start;
    size_t length;
} *buffers;
unsigned int i;

memset(&reqbuf, 0, sizeof(reqbuf));
reqbuf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
reqbuf.memory = V4L2_MEMORY_MMAP;
reqbuf.count = 20;

if (-1 == ioctl(fd, VIDIOC_REQBUFS, &reqbuf)) {
    if (errno == EINVAL)
        printf("Video capturing or mmap-streaming is not supported\n");
    else
        perror("VIDIOC_REQBUFS");
    exit(EXIT_FAILURE);
}
/* We want at least five buffers. */
```

¹ One could use one file descriptor and set the buffer type field accordingly when calling `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` etc., but it makes the `select()` function ambiguous. We also like the clean approach of one file descriptor per logical stream. Video overlay for example is also a logical stream, although the CPU is not needed for continuous operation.
Example: Mapping buffers in the multi-planar API

```c
struct v4l2_requestbuffers reqbuf;
/* Our current format uses 3 planes per buffer */
#define NUM_PLANES 3

struct {
  void *start[NUM_PLANES];
  size_t length[NUM_PLANES];
} *buffers;
unsigned int i, j;

memset(&reqbuf, 0, sizeof(reqbuf));
reqbuf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE;
reqbuf.memory = V4L2_MEMORY_MMAP;
reqbuf.count = 20;

if (ioctl(fd, VIDIOC_REQBUFS, &reqbuf) < 0) {
  /* Unmap and free previously mapped buffers. */
  for (i = 0; i < reqbuf.count; i++) {
    munmap(buffers[i].start, buffers[i].length);
  }
}
```

1.2. Part I - Video for Linux API
if (errno == EINVAL)
    printf("Video capturing or mmap-streaming is not supported\n");
else
    perror("VIDIOC_REQBUFS");

exit(EXIT_FAILURE);

/* We want at least five buffers. */

if (reqbuf.count < 5) {
    /* You may need to free the buffers here. */
    printf("Not enough buffer memory\n");
    exit(EXIT_FAILURE);
}

buffers = calloc(reqbuf.count, sizeof(*buffers));
assert(buffers != NULL);

for (i = 0; i < reqbuf.count; i++) {
    struct v4l2_buffer buffer;
    struct v4l2_plane planes[FMT_NUM_PLANES];

    memset(&buffer, 0, sizeof(buffer));
    buffer.type = reqbuf.type;
    buffer.memory = V4L2_MEMORY_MMAP;
    buffer.index = i;
    /* length in struct v4l2_buffer in multi-planar API stores the size * of planes array. */
    buffer.length = FMT_NUM_PLANES;
    buffer.m.planes = planes;

    if (ioctl(fd, VIDIOC_QUERYBUF, &buffer) < 0) {
        perror("VIDIOC_QUERYBUF");
        exit(EXIT_FAILURE);
    }
    /* Every plane has to be mapped separately */
    for (j = 0; j < FMT_NUM_PLANES; j++) {
        buffers[i].length[j] = buffer.m.planes[j].length; /* remember for munmap() */

        buffers[i].start[j] = mmap(NULL, buffer.m.planes[j].length,
                                  PROT_READ | PROT_WRITE, /* recommended */
                                  MAP_SHARED, /* recommended */
                                  fd, buffer.m.planes[j].m.offset);

        if (MAP_FAILED == buffers[i].start[j]) {
            /* If you do not exit here you should unmmap() and free() the buffers and planes mapped so far. */
            perror("mmap");
            exit(EXIT_FAILURE);
        }
    }

    /* Cleanup. */
    for (i = 0; i < reqbuf.count; i++)
        for (j = 0; j < FMT_NUM_PLANES; j++)
            munmap(buffers[i].start[j], buffers[i].length[j]);

Conceptually streaming drivers maintain two buffer queues, an incoming and an outgoing queue. They
separate the synchronous capture or output operation locked to a video clock from the application which is subject to random disk or network delays and preemption by other processes, thereby reducing the probability of data loss. The queues are organized as FIFOs, buffers will be output in the order enqueued in the incoming FIFO, and were captured in the order dequeued from the outgoing FIFO.

The driver may require a minimum number of buffers enqueued at all times to function, apart of this no limit exists on the number of buffers applications can enqueue in advance, or dequeue and process. They can also enqueue in a different order than buffers have been dequeued, and the driver can fill enqueued empty buffers in any order. 2 The index number of a buffer (struct v4l2_buffer index) plays no role here, it only identifies the buffer.

Initially all mapped buffers are in dequeued state, inaccessible by the driver. For capturing applications it is customary to first enqueue all mapped buffers, then to start capturing and enter the read loop. Here the application waits until a filled buffer can be dequeued, and re-enqueues the buffer when the data is no longer needed. Output applications fill and enqueue buffers, when enough buffers are stacked up the output is started with VIDIOC_STREAMON. In the write loop, when the application runs out of free buffers, it must wait until an empty buffer can be dequeued and reused.

To enqueue and dequeue a buffer applications use the ioctl VIDIOC_QBUF, VIDIOC_DQBUF and VIDIOC_DQBUF ioctl. The status of a buffer being mapped, enqueued, full or empty can be determined at any time using the ioctl VIDIOC_QUERYBUF ioctl. Two methods exist to suspend execution of the application until one or more buffers can be dequeued. By default VIDIOC_DQBUF blocks when no buffer is in the outgoing queue. When the O_NONBLOCK flag was given to the open() function, VIDIOC_DQBUF returns immediately with an EAGAIN error code when no buffer is available. The select() or poll() functions are always available.

To start and stop capturing or output applications call the VIDIOC_STREAMON and VIDIOC_STREAMOFF ioctl.

Drivers implementing memory mapping I/O must support the VIDIOC_REQBUFS, VIDIOC_QUERYBUF, VIDIOC_QBUF, VIDIOC_DQBUF, VIDIOC_STREAMON and VIDIOC_STREAMOFF ioctls, the mmap(), munmap(), select() and poll() function. 3

STREAMING I/O (USER POINTERS)

Input and output devices support this I/O method when the V4L2_CAP_STREAMING flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl is set. If the particular user pointer method (not only memory mapping) is supported must be determined by calling the ioctl VIDIOC_REQBUFS ioctl with the memory type set to V4L2_MEMORY_USERPTR.

This I/O method combines advantages of the read/write and memory mapping methods. Buffers (planes) are allocated by the application itself, and can reside for example in virtual or shared memory. Only pointers to data are exchanged, these pointers and meta-information are passed in struct v4l2_buffer (or in struct v4l2_plane in the multi-planar API case). The driver must be switched into user pointer I/O mode by calling the ioctl VIDIOC_REQBUFS with the desired buffer type. No buffers (planes) are allocated beforehand, consequently they are not indexed and cannot be queried like mapped buffers with the VIDIOC_QUERYBUF ioctl.

Example: Initiating streaming I/O with user pointers

```c
struct v4l2_requestbuffers reqbuf;
memset (&reqbuf, 0, sizeof (reqbuf));
reqbuf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
```

2 Random enqueue order permits applications processing images out of order (such as video codecs) to return buffers earlier, reducing the probability of data loss. Random fill order allows drivers to reuse buffers on a LIFO-basis, taking advantage of caches holding scatter-gather lists and the like.

3 At the driver level select() and poll() are the same, and select() is too important to be optional. The rest should be evident.
reqbuf.memory = V4L2_MEMORY_USERPTR;

if (ioctl (fd, VIDIOC_REQBUFS, &reqbuf) == -1) {
    if (errno == EINVAL)
        printf ("Video capturing or user pointer streaming is not supported\n");
    else
        perror ("VIDIOC_REQBUFS");
    exit (EXIT_FAILURE);
}

Buffer (plane) addresses and sizes are passed on the fly with the VIDIOC_QBUF ioctl. Although buffers are commonly cycled, applications can pass different addresses and sizes at each VIDIOC_QBUF call. If required by the hardware the driver swaps memory pages within physical memory to create a continuous area of memory. This happens transparently to the application in the virtual memory subsystem of the kernel. When buffer pages have been swapped out to disk they are brought back and finally locked in physical memory for DMA. ¹

Filled or displayed buffers are dequeued with the VIDIOC_DQBUF ioctl. The driver can unlock the memory pages at any time between the completion of the DMA and this ioctl. The memory is also unlocked when VIDIOC_STREAMOFF is called, ioctl VIDIOC_REQB ufs, or when the device is closed. Applications must take care not to free buffers without dequeuing. For once, the buffers remain locked until further, wasting physical memory. Second the driver will not be notified when the memory is returned to the application’s free list and subsequently reused for other purposes, possibly completing the requested DMA and overwriting valuable data.

For capturing applications it is customary to enqueue a number of empty buffers, to start capturing and enter the read loop. Here the application waits until a filled buffer can be dequeued, and re-enqueues the buffer when the data is no longer needed. Output applications fill and enqueue buffers, when enough buffers are stacked up output is started. In the write loop, when the application runs out of free buffers it must wait until an empty buffer can be dequeued and reused. Two methods exist to suspend execution of the application until one or more buffers can be dequeued. By default VIDIOC_DQBUF blocks when no buffer is in the outgoing queue. When the O_NONBLOCK flag was given to the open() function, VIDIOC_DQBUF returns immediately with an EAGAIN error code when no buffer is available. The select() or poll() function are always available.

To start and stop capturing or output applications call the VIDIOC_STREAMON and VIDIOC_STREAMOFF ioctl.

---

**Note:**

ref:VIDIOC_STREAMOFF <VIDIOC_STREAMON> removes all buffers from both queues and unlocks all buffers as a side effect. Since there is no notion of doing anything “now” on a multitasking system, if an application needs to synchronize with another event it should examine the struct v4l2_buffer timestamp of captured or outputted buffers.

---

Drivers implementing user pointer I/O must support the VIDIOC_REQBUFS, VIDIOC_QBUF, VIDIOC_DQBUF, VIDIOC_STREAMON and VIDIOC_STREAMOFF ioctls, the select() and poll() function.

¹ We expect that frequently used buffers are typically not swapped out. Anyway, the process of swapping, locking or generating scatter-gather lists may be time consuming. The delay can be masked by the depth of the incoming buffer queue, and perhaps by maintaining caches assuming a buffer will be soon enqueued again. On the other hand, to optimize memory usage drivers can limit the number of buffers locked in advance and recycle the most recently used buffers first. Of course, the pages of empty buffers in the incoming queue need not be saved to disk. Output buffers must be saved on the incoming and outgoing queue because an application may share them with other processes.

² At the driver level select() and poll() are the same, and select() is too important to be optional. The rest should be evident.
Streaming I/O (DMA buffer importing)

The DMABUF framework provides a generic method for sharing buffers between multiple devices. Device drivers that support DMABUF can export a DMA buffer to userspace as a file descriptor (known as the exporter role), import a DMA buffer from userspace using a file descriptor previously exported for a different or the same device (known as the importer role), or both. This section describes the DMABUF importer role API in V4L2.

Refer to DMABUF exporting for details about exporting V4L2 buffers as DMABUF file descriptors.

Input and output devices support the streaming I/O method when the V4L2_CAP_STREAMING flag in the capabilities field of struct v4l2_capability returned by the VIDIOC_QUERYCAP ioctl is set. Whether importing DMA buffers through DMABUF file descriptors is supported is determined by calling the VIDIOC_REQBUFS ioctl with the memory type set to V4L2_MEMORY_DMABUF.

This I/O method is dedicated to sharing DMA buffers between different devices, which may be V4L devices or other video-related devices (e.g. DRM). Buffers (planes) are allocated by a driver on behalf of an application. Next, these buffers are exported to the application as file descriptors using an API which is specific for an allocator driver. Only such file descriptor are exchanged. The descriptors and meta-information are passed in struct v4l2_buffer (or in struct v4l2_plane in the multi-planar API case). The driver must be switched into DMABUF I/O mode by calling the VIDIOC_REQBUFS with the desired buffer type.

Example: Initiating streaming I/O with DMABUF file descriptors

```c
struct v4l2_requestbuffers reqbuf;
memset(&reqbuf, 0, sizeof(reqbuf));
reqbuf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
reqbuf.memory = V4L2_MEMORY_DMABUF;
reqbuf.count = 1;

if (ioctl(fd, VIDIOC_REQBUFS, &reqbuf) == -1) {
    if (errno == EINVAL)
        printf("Video capturing or DMABUF streaming is not supported\n");
    else
        perror("VIDIOC_REQBUFS");
    exit(EXIT_FAILURE);
}
```

The buffer (plane) file descriptor is passed on the fly with the VIDIOC_QBUF ioctl. In case of multiplanar buffers, every plane can be associated with a different DMABUF descriptor. Although buffers are commonly cycled, applications can pass a different DMABUF descriptor at each VIDIOC_QBUF call.

Example: Queueing DMABUF using single plane API

```c
int buffer_queue(int v4lfd, int index, int dmafd)
{
    struct v4l2_buffer buf;
    memset(&buf, 0, sizeof(buf));
    buf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE;
    buf.memory = V4L2_MEMORY_DMABUF;
    buf.index = index;
    buf.m.fd = dmafd;

    if (ioctl(v4lfd, VIDIOC_QBUF, &buf) == -1) {
        perror("VIDIOC_QBUF");
    }
}
```
Example 3.6. Queueing DMABUF using multi plane API

```c
int buffer_queue_mp(int v4lfd, int index, int dmafd[], int n_planes)
{
    struct v4l2_buffer buf;
    struct v4l2_plane planes[VIDEO_MAX_PLANES];
    int i;

    memset(&buf, 0, sizeof buf);
    buf.type = V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE;
    buf.memory = V4L2_MEMORY_DMABUF;
    buf.index = index;
    buf.m.planes = planes;
    buf.length = n_planes;

    memset(&planes, 0, sizeof planes);

    for (i = 0; i < n_planes; ++i)
        buf.m.planes[i].m.fd = dmafd[i];

    if (ioctl(v4lfd, VIDIOC_QBUF, &buf) == -1) {
        perror("VIDIOC_QBUF");
        return -1;
    }

    return 0;
}
```

Captured or displayed buffers are dequeued with the `VIDIOC_DQBUF` ioctl. The driver can unlock the buffer at any time between the completion of the DMA and this ioctl. The memory is also unlocked when `VIDIOC_STREAMOFF` is called, `VIDIOC_REQBUFS`, or when the device is closed.

For capturing applications it is customary to enqueue a number of empty buffers, to start capturing and enter the read loop. Here the application waits until a filled buffer can be dequeued, and re-enqueues the buffer when the data is no longer needed. Output applications fill and enqueue buffers, when enough buffers are stacked up output is started. In the write loop, when the application runs out of free buffers it must wait until an empty buffer can be dequeued and reused. Two methods exist to suspend execution of the application until one or more buffers can be dequeued. By default `VIDIOC_DQBUF` blocks when no buffer is in the outgoing queue. When the `O_NONBLOCK` flag was given to the `open()` function, `VIDIOC_DQBUF` returns immediately with an `EAGAIN` error code when no buffer is available. The `select()` and `poll()` functions are always available.

To start and stop capturing or displaying applications call the `VIDIOC_STREAMON` and `VIDIOC_STREAMOFF` ioctls.

**Note:**

`VIDIOC_STREAMOFF` removes all buffers from both queues and unlocks all buffers as a side effect. Since there is no notion of doing anything “now” on a multitasking system, if an application needs to synchronize with another event it should examine the struct `v4l2_buffer` timestamp of captured or outputted buffers.
Drivers implementing DMABUF importing I/O must support the `VIDIOC_REQBUFS`, `VIDIOC_QBUF`, `VIDIOC_DQBUF`, `VIDIOC_STREAMON` and `VIDIOC_STREAMOFF` ioctls, and the `select()` and `poll()` functions.

**Asynchronous I/O**

This method is not defined yet.

**Buffers**

A buffer contains data exchanged by application and driver using one of the Streaming I/O methods. In the multi-planar API, the data is held in planes, while the buffer structure acts as a container for the planes. Only pointers to buffers (planes) are exchanged, the data itself is not copied. These pointers, together with meta-information like timestamps or field parity, are stored in a struct `struct v4l2_buffer`, argument to the `ioctl VIDIOC_QUERYBUF`, `ioctl VIDIOC_QBUF`, `VIDIOC_DQBUF` and `VIDIOC_DQBUF` ioctl. In the multi-planar API, some plane-specific members of struct `struct v4l2_buffer`, such as pointers and sizes for each plane, are stored in struct `struct v4l2_plane` instead. In that case, struct `struct v4l2_buffer` contains an array of plane structures.

Dequeued video buffers come with timestamps. The driver decides at which part of the frame and with which clock the timestamp is taken. Please see flags in the masks `V4L2_BUF_FLAG_TIMESTAMP_MASK` and `V4L2_BUF_FLAG_TSTAMP_SRC_MASK` in `Buffer Flags`. These flags are always valid and constant across all buffers during the whole video stream. Changes in these flags may take place as a side effect of `VIDIOC_S_INPUT` or `VIDIOC_S_OUTPUT` however. The `V4L2_BUF_FLAG_TIMESTAMP_COPY` timestamp type which is used by e.g. on mem-to-mem devices is an exception to the rule: the timestamp source flags are copied from the OUTPUT video buffer to the CAPTURE video buffer.

**struct v4l2_buffer**

Here is a table showing the fields of `struct v4l2_buffer`:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32 index</td>
<td>Number of the buffer, set by the application except when calling <code>VIDIOC_DQBUF</code>, then it is set by the driver. This field can range from zero to the number of buffers allocated with the <code>ioctl VIDIOC_REQBUFS</code> ioctl (struct <code>v4l2_requestbuffers</code> count), plus any buffers allocated with <code>ioctl VIDIOC_CREATE_BUFS</code> minus one.</td>
</tr>
<tr>
<td>__u32 type</td>
<td>Type of the buffer, same as struct <code>v4l2_format</code> type or struct <code>v4l2_requestbuffers</code> type, set by the application. See <code>enum v4l2_buf_type</code>.</td>
</tr>
<tr>
<td>__u32 bytesused</td>
<td>The number of bytes occupied by the data in the buffer. It depends on the negotiated data format and may change with each buffer for compressed variable size data like JPEG images. Drivers must set this field when type refers to a capture stream, applications when it refers to an output stream. If the application sets this to 0 for an output stream, then bytesused will be set to the size of the buffer (see the length field of this struct) by the driver. For multiplanar formats this field is ignored and the <code>planes</code> pointer is used instead.</td>
</tr>
<tr>
<td>__u32 flags</td>
<td>Flags set by the application or driver, see <code>Buffer Flags</code>.</td>
</tr>
<tr>
<td>__u32 field</td>
<td>Indicates the field order of the image in the buffer, see <code>enum v4l2_field</code>. This field is not used when the buffer contains VBI data. Drivers must set it when type refers to a capture stream, applications when it refers to an output stream.</td>
</tr>
</tbody>
</table>

Continued on next page
### Table 1.25 – continued from previous page

| struct timeval | timestamp          | For capture streams this is time when the first data byte was captured, as returned by the `clock_gettime()` function for the relevant clock id; see `V4L2_BUF_FLAG_TIMESTAMP` in *Buffer Flags*. For output streams the driver stores the time at which the last data byte was actually sent out in the timestamp field. This permits applications to monitor the drift between the video and system clock. For output streams that use `V4L2_BUF_FLAG_TIMESTAMP_COPY` the application has to fill in the timestamp which will be copied by the driver to the capture stream.

| struct v4l2_timecode | timecode          | When `type` is `V4L2_BUF_TYPE_VIDEO_CAPTURE` and the `V4L2_BUF_FLAG_TIMECODE` flag is set in `flags`, this structure contains a frame timecode. In `V4L2_FIELD_ALTERNATE` mode the top and bottom field contain the same timecode. Timecodes are intended to help video editing and are typically recorded on video tapes, but also embedded in compressed formats like MPEG. This field is independent of the timestamp and sequence fields.

| __u32 | sequence | Set by the driver, counting the frames (not fields!) in sequence. This field is set for both input and output devices.

In `V4L2_FIELD_ALTERNATE` mode the top and bottom field have the same sequence number. The count starts at zero and includes dropped or repeated frames. A dropped frame was received by an input device but could not be stored due to lack of free buffer space. A repeated frame was displayed again by an output device because the application did not pass new data in time.

**Note:**

*This may count the frames received e.g. over USB, without taking into account the frames dropped by the remote hardware due to limited compression throughput or bus bandwidth. These devices identify by not enumerating any video standards, see Video Standards.*

| __u32 | memory | This field must be set by applications and/or drivers in accordance with the selected I/O method. See `enum v4l2_memory`

| union m | offset | For the single-planar API and when memory is `V4L2_MEMORY_MMAP` this is the offset of the buffer from the start of the device memory. The value is returned by the driver and apart of serving as parameter to the `mmap()` function not useful for applications. See Streaming I/O (Memory Mapping) for details.

| unsigned long | userptr | For the single-planar API and when memory is `V4L2_MEMORY_USERPTR` this is a pointer to the buffer (casted to unsigned long type) in virtual memory, set by the application. See Streaming I/O (User Pointers) for details.

Buffer Flags
<table>
<thead>
<tr>
<th>Flag Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_BUF_FLAG_MAPPED</td>
<td>0x00000001</td>
<td>The buffer resides in device memory and has been mapped into the application’s address space, see [Streaming I/O (Memory Mapping)] for details. Drivers set or clear this flag when the <code>ioctl VIDIOC_QUERYBUF</code>, <code>ioctl VIDIOC_QBUF, VIDIOC_DQBUF</code> or <code>VIDIOC_DQBUF</code> ioctl is called. Set by the driver.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_QUEUED</td>
<td>0x00000002</td>
<td>Internally drivers maintain two buffer queues, an incoming and outgoing queue. When this flag is set, the buffer is currently on the incoming queue. It automatically moves to the outgoing queue after the buffer has been filled (capture devices) or displayed (output devices). Drivers set or clear this flag when the VIDIOC_QUERYBUF ioctl is called. After (successful) calling the VIDIOC_QBUF ioctl it is always set and after VIDIOC_DQBUF always cleared.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_DONE</td>
<td>0x00000004</td>
<td>When this flag is set, the buffer is currently on the outgoing queue, ready to be dequeued from the driver. Drivers set or clear this flag when the VIDIOC_QUERYBUF ioctl is called. After calling the VIDIOC_QBUF or VIDIOC_DQBUF it is always cleared. Of course a buffer cannot be on both queues at the same time, the V4L2_BUF_FLAG_QUEUED and V4L2_BUF_FLAG_DONE flag are mutually exclusive. They can be both cleared however, then the buffer is in “dequeued” state, in the application domain so to say.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_ERROR</td>
<td>0x00000040</td>
<td>When this flag is set, the buffer has been dequeued successfully, although the data might have been corrupted. This is recoverable, streaming may continue as normal and the buffer may be reused normally. Drivers set this flag when the VIDIOC_DQBUF ioctl is called.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_KEYFRAME</td>
<td>0x00000008</td>
<td>Drivers set or clear this flag when calling the VIDIOC_DQBUF ioctl. It may be set by video capture devices when the buffer contains a compressed image which is a key frame (or field), i.e. can be decompressed on its own. Also known as an I-frame. Applications can set this bit when type refers to an output stream.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_PFRAME</td>
<td>0x00000010</td>
<td>Similar to V4L2_BUF_FLAG_KEYFRAME this flags predicted frames or fields which contain only differences to a previous key frame. Applications can set this bit when type refers to an output stream.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_BFRAME</td>
<td>0x00000020</td>
<td>Similar to V4L2_BUF_FLAG_KEYFRAME this flags a bi-directional predicted frame or field which contains only the differences between the current frame and both the preceding and following key frames to specify its content. Applications can set this bit when type refers to an output stream.</td>
</tr>
</tbody>
</table>

Table 1.27 – continued from previous page

<table>
<thead>
<tr>
<th>V4L2_BUF_FLAG_TIMECODE</th>
<th>0x00000100</th>
<th>The timecode field is valid. Drivers set or clear this flag when the VIDIOC_DQBUF ioctl is called. Applications can set this bit and the corresponding timecode structure when type refers to an output stream.</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_BUF_FLAG_PREPARED</td>
<td>0x00000400</td>
<td>The buffer has been prepared for I/O and can be queued by the application. Drivers set or clear this flag when the ioctl VIDIOC_QUERYBUF, VIDIOC_PREPARE_BUF, VIDIOC_QBUF, VIDIOC_DQBUF or VIDIOC_DQBUF ioctl is called.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_NO_CACHE_INVALIDATE</td>
<td>0x00000800</td>
<td>Caches do not have to be invalidated for this buffer. Typically applications shall use this flag if the data captured in the buffer is not going to be touched by the CPU, instead the buffer will, probably, be passed on to a DMA-capable hardware unit for further processing or output.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_NO_CACHE_CLEAN</td>
<td>0x00001000</td>
<td>Caches do not have to be cleaned for this buffer. Typically applications shall use this flag for output buffers if the data in this buffer has not been created by the CPU but by some DMA-capable unit, in which case caches have not been used.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_LAST</td>
<td>0x00100000</td>
<td>Last buffer produced by the hardware. mem2mem codec drivers set this flag on the capture queue for the last buffer when the ioctl VIDIOC_QUERYBUF or VIDIOC_DQBUF ioctl is called. Due to hardware limitations, the last buffer may be empty. In this case the driver will set the bytesused field to 0, regardless of the format. Any Any subsequent call to the VIDIOC_DQBUF ioctl will not block anymore, but return an EPIPE error code.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_TIMESTAMP_MASK</td>
<td>0x0000e000</td>
<td>Mask for timestamp types below. To test the timestamp type, mask out bits not belonging to timestamp type by performing a logical and operation with buffer flags and timestamp mask.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_TIMESTAMP_UNKNOWN</td>
<td>0x00000000</td>
<td>Unknown timestamp type. This type is used by drivers before Linux 3.9 and may be either monotonic (see below) or real-time (wall clock). Monotonic clock has been favoured in embedded systems whereas most of the drivers use the realtime clock. Either kinds of timestamps are available in user space via clock_gettime(2)() using clock IDs CLOCK_MONOTONIC and CLOCK_REALTIME, respectively.</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_TIMESTAMP_MONOTONIC</td>
<td>0x00002000</td>
<td>The buffer timestamp has been taken from the CLOCK_MONOTONIC clock. To access the same clock outside V4L2, use clock_gettime(2)().</td>
</tr>
<tr>
<td>V4L2_BUF_FLAG_TIMESTAMP_COPY</td>
<td>0x00004000</td>
<td>The CAPTURE buffer timestamp has been taken from the corresponding OUTPUT buffer. This flag applies only to mem2mem devices.</td>
</tr>
</tbody>
</table>

Continued on next page
Table 1.27 – continued from previous page

| V4L2_BUF_FLAG_TSTAMP_SRC_MASK                  | 0x00070000 | Mask for timestamp sources below. The timestamp source defines the point of time the timestamp is taken in relation to the frame. Logical ‘and’ operation between the flags field and V4L2_BUF_FLAG_TSTAMP_SRC_MASK produces the value of the timestamp source. Applications must set the timestamp source when type refers to an output stream and V4L2_BUF_FLAG_TIMESTAMP_COPY is set. |
| V4L2_BUF_FLAG_TSTAMP_SRC_EOF                   | 0x00000000 | End Of Frame. The buffer timestamp has been taken when the last pixel of the frame has been received or the last pixel of the frame has been transmitted. In practice, software generated timestamps will typically be read from the clock a small amount of time after the last pixel has been received or transmitted, depending on the system and other activity in it. |
| V4L2_BUF_FLAG_TSTAMP_SRC_SOE                   | 0x00010000 | Start Of Exposure. The buffer timestamp has been taken when the exposure of the frame has begun. This is only valid for the V4L2_BUF_TYPE_VIDEO_CAPTURE buffer type. |

enum v4l2_memory

| V4L2_MEMORY_MMAP       | 1 | The buffer is used for memory mapping I/O. |
| V4L2_MEMORY_USERPTR    | 2 | The buffer is used for user pointer I/O. |
| V4L2_MEMORY_OVERLAY    | 3 | [to do] |
| V4L2_MEMORY_DMABUF     | 4 | The buffer is used for DMA shared buffer I/O. |

Timecodes

The struct v4l2_timecode structure is designed to hold a SMPTE 12M or similar timecode. (struct struct timeval timestamps are stored in struct v4l2_buffer field timestamp.)

struct v4l2_timecode

| __u32                 | type                       | Frame rate the timecodes are based on, see Timecode Types. |
| __u32                 | flags                      | Timecode flags, see Timecode Flags. |
| __u8                  | frames                     | Frame count, 0 ... 23/24/29/49/59, depending on the type of timecode. |
| __u8                  | seconds                    | Seconds count, 0 ... 59. This is a binary, not BCD number. |
| __u8                  | minutes                    | Minutes count, 0 ... 59. This is a binary, not BCD number. |
| __u8                  | hours                      | Hours count, 0 ... 29. This is a binary, not BCD number. |
| __u8                  | userbits[4]                | The “user group” bits from the timecode. |
## Timecode Types

<table>
<thead>
<tr>
<th>Timecode Type</th>

## Field Order

We have to distinguish between progressive and interlaced video. Progressive video transmits all lines of a video image sequentially. Interlaced video divides an image into two fields, containing only the odd and even lines of the image, respectively. Alternating the so called odd and even field are transmitted, and due to a small delay between fields a cathode ray TV displays the lines interleaved, yielding the original frame. This curious technique was invented because at refresh rates similar to film the image would fade out too quickly. Transmitting fields reduces the flicker without the necessity of doubling the frame rate and with it the bandwidth required for each channel.

It is important to understand a video camera does not expose one frame at a time, merely transmitting the frames separated into fields. The fields are in fact captured at two different instances in time. An object on screen may well move between one field and the next. For applications analysing motion it is of paramount importance to recognize which field of a frame is older, the temporal order.

When the driver provides or accepts images field by field rather than interleaved, it is also important applications understand how the fields combine to frames. We distinguish between top (aka odd) and bottom (aka even) fields, the spatial order: The first line of the top field is the first line of an interlaced frame, the first line of the bottom field is the second line of that frame.

However because fields were captured one after the other, arguing whether a frame commences with the top or bottom field is pointless. Any two successive top and bottom, or bottom and top fields yield a valid frame. Only when the source was progressive to begin with, e.g. when transferring film to video, two fields may come from the same frame, creating a natural order.

Counter to intuition the top field is not necessarily the older field. Whether the older field contains the top or bottom lines is a convention determined by the video standard. Hence the distinction between temporal and spatial order of fields. The diagrams below should make this clearer.

All video capture and output devices must report the current field order. Some drivers may permit the selection of a different order, to this end applications initialize the field field of struct `v4l2_pix_format` before calling the `VIDIOC_S_FMT` ioctl. If this is not desired it should have the value V4L2_FIELD_ANY (0).
## `enum v4l2_field`

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>V4L2_FIELD_ANY</td>
<td>Applications request this field order when any one of the V4L2_FIELD_NONE, V4L2_FIELD_TOP, V4L2_FIELD_BOTTOM, or V4L2_FIELD_INTERLACED formats is acceptable. Drivers choose depending on hardware capabilities or e.g. the requested image size, and return the actual field order. Drivers must never return V4L2_FIELD_ANY. If multiple field orders are possible the driver must choose one of the possible field orders during <code>VIDIOC_S_FMT</code> or <code>VIDIOC_TRY_FMT</code>. The <code>v4l2_buffer</code> field can never be V4L2_FIELD_ANY.</td>
</tr>
<tr>
<td>V4L2_FIELD_NONE</td>
<td>Images are in progressive format, not interlaced. The driver may also indicate this order when it cannot distinguish between V4L2_FIELD_TOP and V4L2_FIELD_BOTTOM.</td>
</tr>
<tr>
<td>V4L2_FIELD_TOP</td>
<td>Images consist of the top (aka odd) field only. Applications may wish to prevent a device from capturing interlaced images because they will have “comb” or “feathering” artefacts around moving objects.</td>
</tr>
<tr>
<td>V4L2_FIELD_BOTTOM</td>
<td>Images consist of the bottom (aka even) field only. Applications may wish to prevent a device from capturing interlaced images because they will have “comb” or “feathering” artefacts around moving objects.</td>
</tr>
<tr>
<td>V4L2_FIELD_INTERLACED</td>
<td>Images contain both fields, interleaved line by line. The temporal order of the fields (whether the top or bottom field is first transmitted) depends on the current video standard. M/NTSC transmits the bottom field first, all other standards the top field first.</td>
</tr>
<tr>
<td>V4L2_FIELD_SEQ_TB</td>
<td>Images contain both fields, the top field lines are stored first in memory, immediately followed by the bottom field lines. Fields are always stored in temporal order, the older one first in memory. Image sizes refer to the frame, not fields.</td>
</tr>
<tr>
<td>V4L2_FIELD_SEQ_BT</td>
<td>Images contain both fields, the bottom field lines are stored first in memory, immediately followed by the top field lines. Fields are always stored in temporal order, the older one first in memory. Image sizes refer to the frame, not fields.</td>
</tr>
<tr>
<td>V4L2_FIELD_ALTERNATE</td>
<td>The two fields of a frame are passed in separate buffers, in temporal order, i.e. the older one first. To indicate the field parity (whether the current field is a top or bottom field) the driver or application, depending on data direction, must set struct <code>v4l2_buffer</code> field to V4L2_FIELD_TOP or V4L2_FIELD_BOTTOM. Any two successive fields pair to build a frame. If fields are successive, without any dropped fields between them (fields can drop individually), can be determined from the struct <code>v4l2_buffer</code> sequence field. This format cannot be selected when using the read/write I/O method since there is no way to communicate if a field was a top or bottom field.</td>

1.2.4 Interfaces

Video Capture Interface

Video capture devices sample an analog video signal and store the digitized images in memory. Today nearly all devices can capture at full 25 or 30 frames/second. With this interface applications can control the capture process and move images from the driver into user space.

Conventionally V4L2 video capture devices are accessed through character device special files named /dev/video and /dev/video0 to /dev/video63 with major number 81 and minor numbers 0 to 63. /dev/video is typically a symbolic link to the preferred video device.

Note:
The same device file names are used for video output devices.

Querying Capabilities

Devices supporting the video capture interface set the V4L2_CAP_VIDEO_CAPTURE or V4L2_CAP_VIDEO_CAPTURE_MPLANE flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. As secondary device functions they may also support the video overlay (V4L2_CAP_VIDEO_OVERLAY) and the raw VBI capture (V4L2_CAP_VBI_CAPTURE) interface. At least one of the read/write or streaming I/O methods must be supported. Tuners and audio inputs are optional.

Supplemental Functions

Video capture devices shall support audio input, Tuners and Modulators, controls, cropping and scaling and streaming parameter ioctl as needed. The video input and video standard ioctl must be supported by all video capture devices.

Image Format Negotiation

The result of a capture operation is determined by cropping and image format parameters. The former select an area of the video picture to capture, the latter how images are stored in memory, i. e. in RGB or YUV format, the number of bits per pixel or width and height. Together they also define how images are scaled in the process.

As usual these parameters are not reset at open() time to permit Unix tool chains, programming a device and then reading from it as if it was a plain file. Well written V4L2 applications ensure they really get what they want, including cropping and scaling.

Cropping initialization at minimum requires to reset the parameters to defaults. An example is given in Image Cropping, Insertion and Scaling.

To query the current image format applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_VIDEO_CAPTURE or V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE and call the VIDIOC_G_FMT ioctl with a pointer to this structure. Drivers fill the struct v4l2_pix_format pix or the struct v4l2_pix_format_mplane pix_mp member of the fmt union.
Temporal order, top field first transmitted (e.g. BG/PAL)

v4l2_buffer.field:
V4L2_FIELD_BOTTOM V4L2_FIELD_TOP V4L2_FIELD_BOTTOM V4L2_FIELD_TOP V4L2_FIELD_BOTTOM V4L2_FIELD_TOP
V4L2_FIELD_INTERLACED / V4L2_FIELD_INTERLACED_BT

V4L2_FIELD_INTERLACED_TB (misaligned)

V4L2_FIELD_SEQ_BT
To request different parameters applications set the type field of a struct `v4l2_format` as above and initialize all fields of the struct `v4l2_pix_format` vbi member of the fmt union, or better just modify the results of `VIDIOC_G_FMT`, and call the `VIDIOC_S_FMT` ioctl with a pointer to this structure. Drivers may adjust the parameters and finally return the actual parameters as `VIDIOC_G_FMT` does.

Like `VIDIOC_S_FMT` the `VIDIOC_TRY_FMT` ioctl can be used to learn about hardware limitations without disabling I/O or possibly time consuming hardware preparations.

The contents of struct `v4l2_pix_format` and struct `v4l2_pix_format_mplane` are discussed in `Image Formats`. See also the specification of the `VIDIOC_G_FMT`, `VIDIOC_S_FMT` and `VIDIOC_TRY_FMT` ioctls for details. Video capture devices must implement both the `VIDIOC_G_FMT` and `VIDIOC_S_FMT` ioctl, even if `VIDIOC_S_FMT` ignores all requests and always returns default parameters as `VIDIOC_G_FMT` does. `VIDIOC_TRY_FMT` is optional.

**Reading Images**

A video capture device may support the : `read()` function and/or streaming (memory mapping or user pointer) I/O. See `Input/Output` for details.

**Video Overlay Interface**

**Also known as Framebuffer Overlay or Previewing.**

Video overlay devices have the ability to genlock (TV-)video into the (VGA-)video signal of a graphics card, or to store captured images directly in video memory of a graphics card, typically with clipping. This can be considerably more efficient than capturing images and displaying them by other means. In the old days when only nuclear power plants needed cooling towers this used to be the only way to put live video into a window.

Video overlay devices are accessed through the same character special files as `video capture` devices.

---

**Note:**

The default function of a `/dev/video` device is video capturing. The overlay function is only available after calling the `VIDIOC_S_FMT` ioctl.

---

The driver may support simultaneous overlay and capturing using the read/write and streaming I/O methods. If so, operation at the nominal frame rate of the video standard is not guaranteed. Frames may be directed away from overlay to capture, or one field may be used for overlay and the other for capture if the capture parameters permit this.

Applications should use different file descriptors for capturing and overlay. This must be supported by all drivers capable of simultaneous capturing and overlay. Optionally these drivers may also permit capturing and overlay with a single file descriptor for compatibility with V4L and earlier versions of V4L2. ¹

**Querying Capabilities**

Devices supporting the video overlay interface set the `V4L2_CAP_VIDEO_OVERLAY` flag in the capabilities field of struct `v4l2_capability` returned by the `ioctl` `VIDIOC_QUERYCAP` ioctl. The overlay I/O method specified below must be supported. Tuners and audio inputs are optional.

---

² A common application of two file descriptors is the XFree86 Xv/V4L interface driver and a V4L2 application. While the X server controls video overlay, the application can take advantage of memory mapping and DMA.

In the opinion of the designers of this API, no driver writer taking the efforts to support simultaneous capturing and overlay will restrict this ability by requiring a single file descriptor, as in V4L and earlier versions of V4L2. Making this optional means applications depending on two file descriptors need backup routines to be compatible with all drivers, which is considerable more work than using two fds in applications which do not. Also two fd’s fit the general concept of one file descriptor for each logical stream. Hence as a complexity trade-off drivers must support two file descriptors and may support single fd operation.
Supplemental Functions

Video overlay devices shall support audio input, Tuners and Modulators, controls, cropping and scaling and streaming parameter ioctls as needed. The video input and video standard ioctls must be supported by all video overlay devices.

Setup

Before overlay can commence applications must program the driver with frame buffer parameters, namely the address and size of the frame buffer and the image format, for example RGB 5:6:5. The VIDIOC_G_FBUF and VIDIOC_S_FBUF ioctls are available to get and set these parameters, respectively. The VIDIOC_S_FBUF ioctl is privileged because it allows to set up DMA into physical memory, bypassing the memory protection mechanisms of the kernel. Only the superuser can change the frame buffer address and size. Users are not supposed to run TV applications as root or with SUID bit set. A small helper application with suitable privileges should query the graphics system and program the V4L2 driver at the appropriate time.

Some devices add the video overlay to the output signal of the graphics card. In this case the frame buffer is not modified by the video device, and the frame buffer address and pixel format are not needed by the driver. The VIDIOC_S_FBUF ioctl is not privileged. An application can check for this type of device by calling the VIDIOC_G_FBUF ioctl.

A driver may support any (or none) of five clipping/blending methods:

1. Chroma-keying displays the overlaid image only where pixels in the primary graphics surface assume a certain color.

2. A bitmap can be specified where each bit corresponds to a pixel in the overlaid image. When the bit is set, the corresponding video pixel is displayed, otherwise a pixel of the graphics surface.

3. A list of clipping rectangles can be specified. In these regions no video is displayed, so the graphics surface can be seen here.

4. The framebuffer has an alpha channel that can be used to clip or blend the framebuffer with the video.

5. A global alpha value can be specified to blend the framebuffer contents with video images.

When simultaneous capturing and overlay is supported and the hardware prohibits different image and frame buffer formats, the format requested first takes precedence. The attempt to capture (VIDIOC_S_FMT) or overlay (VIDIOC_S_FBUF) may fail with an EBUSY error code or return accordingly modified parameters.

Overlay Window

The overlaid image is determined by cropping and overlay window parameters. The former select an area of the video picture to capture, the latter how images are overlaid and clipped. Cropping initialization at minimum requires to reset the parameters to defaults. An example is given in Image Cropping, Insertion and Scaling.

The overlay window is described by a struct v4l2_window. It defines the size of the image, its position over the graphics surface and the clipping to be applied. To get the current parameters applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_VIDEO0_OVERLAY and call the VIDIOC_G_FMT ioctl. The driver fills the struct v4l2_window substructure named win. It is not possible to retrieve a previously programmed clipping list or bitmap.

To program the overlay window applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_VIDEO0_OVERLAY, initialize the win substructure and call the VIDIOC_S_FMT ioctl. The driver adjusts the parameters against hardware limits and returns the actual parameters as VIDIOC_G_FMT does. Like VIDIOC_S_FMT, the VIDIOC_TRY_FMT ioctl can be used to learn about driver

1.2. Part I - Video for Linux API
capabilities without actually changing driver state. Unlike `VIDIOC_S_FMT` this also works after the overlay has been enabled.

The scaling factor of the overlaid image is implied by the width and height given in struct `v4l2_window` and the size of the cropping rectangle. For more information see `Image Cropping, Insertion and Scaling`.

When simultaneous capturing and overlay is supported and the hardware prohibits different image and window sizes, the size requested first takes precedence. The attempt to capture or overlay as well (`VIDIOC_S_FMT`) may fail with an EBUSY error code or return accordingly modified parameters.

```c
struct v4l2_window
```

- **struct v4l2_rect w**: Size and position of the window relative to the top, left corner of the frame buffer defined with `VIDIOC_S_FBUF`. The window can extend the frame buffer width and height, the x and y coordinates can be negative, and it can lie completely outside the frame buffer. The driver clips the window accordingly, or if that is not possible, modifies its size and/or position.

- **enum v4l2_field field**: Applications set this field to determine which video field shall be overlaid, typically one of `V4L2_FIELD_ANY (0), V4L2_FIELD_TOP, V4L2_FIELD_BOTTOM` or `V4L2_FIELD_INTERLACED`. Drivers may have to choose a different field order and return the actual setting here.

- **__u32 chromakey**: When chroma-keying has been negotiated with `VIDIOC_S_FBUF`, applications set this field to the desired pixel value for the chroma key. The format is the same as the pixel format of the framebuffer (struct `v4l2_framebuffer` `fmt.pixelformat` field), with bytes in host order. E.g. for `V4L2_PIX_FMT_BGR24` the value should be 0xRRGGBB on a little endian, 0xBBGGRR on a big endian host.

- **struct v4l2_clip * clips**: When chroma-keying has not been negotiated and `VIDIOC_G_FBUF` indicated this capability, applications can set this field to point to an array of clipping rectangles.

  Like the window coordinates `w`, clipping rectangles are defined relative to the top, left corner of the frame buffer. However, clipping rectangles must not extend the frame buffer width and height, and they must not overlap. If possible applications should merge adjacent rectangles. Whether this must create x-y or y-x bands, or the order of rectangles, is not defined. When clip lists are not supported the driver ignores this field. Its contents after calling `VIDIOC_S_FMT` are undefined.

- **__u32 clipcount**: When the application set the `clips` field, this field must contain the number of clipping rectangles in the list. When clip lists are not supported the driver ignores this field, its contents after calling `VIDIOC_S_FMT` are undefined. When clip lists are supported but no clipping is desired this field must be set to zero.

- **void * bitmap**: When chroma-keying has not been negotiated and `VIDIOC_G_FBUF` indicated this capability, applications can set this field to point to a clipping bit mask.

  It must be of the same size as the window, `w.width` and `w.height`. Each bit corresponds to a pixel in the overlaid image, which is displayed only when the bit is set. Pixel coordinates translate to bits like:

  ```c
  ((__u8 *) bitmap)[w.width * y + x / 8] & (1 << (x & 7))
  ```

  where `0 ≤ x < w.width` and `0 ≤ y < w.height`.  

  When a clipping bit mask is not supported the driver ignores this field, its contents after calling `VIDIOC_S_FMT` are undefined. When a bit mask is supported but no clipping is desired this field must be set to NULL.

Applications need not create a clip list or bit mask. When they pass both, or despite negotiating chroma-keying, the results are undefined. Regardless of the chosen method, the clipping abilities of the hardware may be limited in quantity or quality. The results when these limits are exceeded are undefined.  

---

1 Should we require `w.width` to be a multiple of eight?

2 When the image is written into frame buffer memory it will be undesirable if the driver clips out less pixels than expected, because the application and graphics system are not aware these regions need to be refreshed. The driver should clip out more pixels or not write the image at all.

3 When the image is written into frame buffer memory it will be undesirable if the driver clips out less pixels than expected, because the application and graphics system are not aware these regions need to be refreshed. The driver should clip out more pixels or not write the image at all.

---

124 Chapter 1. Linux Media Infrastructure userspace API
__u8 global_alpha The global alpha value used to blend the framebuffer with video images, if global alpha blending has been negotiated (V4L2_FBUF_FLAG_GLOBAL_ALPHA, see VIDIOC_S_FBUF, Frame Buffer Flags).

**Note:**

This field was added in Linux 2.6.23, extending the structure. However the VIDIOC_[G|S|TRY]_FMT ioctls, which take a pointer to a v4l2_format parent structure with padding bytes at the end, are not affected.

struct v4l2_clip

struct v4l2_rect c Coordinates of the clipping rectangle, relative to the top, left corner of the frame buffer. Only window pixels outside all clipping rectangles are displayed.

struct v4l2_clip * next Pointer to the next clipping rectangle, NULL when this is the last rectangle.

Drivers ignore this field, it cannot be used to pass a linked list of clipping rectangles.

struct v4l2_rect

__s32 left Horizontal offset of the top, left corner of the rectangle, in pixels.

__s32 top Vertical offset of the top, left corner of the rectangle, in pixels. Offsets increase to the right and down.

__u32 width Width of the rectangle, in pixels.

__u32 height Height of the rectangle, in pixels.

**Enabling Overlay**

To start or stop the frame buffer overlay applications call the ioctl VIDIOC_OVERLAY ioctl.

**Video Output Interface**

Video output devices encode stills or image sequences as analog video signal. With this interface applications can control the encoding process and move images from user space to the driver.

Conventionally V4L2 video output devices are accessed through character device special files named /dev/video and /dev/video0 to /dev/video63 with major number 81 and minor numbers 0 to 63. /dev/video is typically a symbolic link to the preferred video device.

..note:: The same device file names are used also for video capture devices.

**Querying Capabilities**

Devices supporting the video output interface set the V4L2_CAP_VIDEO_OUTPUT or V4L2_CAP_VIDEO_OUTPUT_MPLANE flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. As secondary device functions they may also support the raw VBI output (V4L2_CAP_VBI_OUTPUT) interface. At least one of the read/write or streaming I/O methods must be supported. Modulators and audio outputs are optional.

---

4 The X Window system defines “regions” which are vectors of struct BoxRec { short x1,y1,x2,y2; } with width = x2 -x1 and height = y2 -y1, so one cannot pass X11 clip lists directly.
Supplemental Functions

Video output devices shall support audio output, modulator, controls, cropping and scaling and streaming parameter ioctls as needed. The video output and video standard ioctls must be supported by all video output devices.

Image Format Negotiation

The output is determined by cropping and image format parameters. The former select an area of the video picture where the image will appear, the latter how images are stored in memory, i.e., in RGB or YUV format, the number of bits per pixel or width and height. Together they also define how images are scaled in the process.

As usual these parameters are not reset at open() time to permit Unix tool chains, programming a device and then writing to it as if it was a plain file. Well written V4L2 applications ensure they really get what they want, including cropping and scaling.

Cropping initialization at minimum requires to reset the parameters to defaults. An example is given in Image Cropping, Insertion and Scaling.

To query the current image format applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_VIDEO_OUTPUT or V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE and call the VIDIOC_G_FMT ioctl with a pointer to this structure. Drivers fill the struct v4l2_pix_format pix or the struct v4l2_pix_format_mplane pix_mp member of the fmt union.

To request different parameters applications set the type field of a struct v4l2_format as above and initialize all fields of the struct v4l2_pix_format vbi member of the fmt union, or better just modify the results of VIDIOC_G_FMT, and call the VIDIOC_S_FMT ioctl with a pointer to this structure. Drivers may adjust the parameters and finally return the actual parameters as VIDIOC_G_FMT does.

Like VIDIOC_S_FMT the VIDIOC_TRY_FMT ioctl can be used to learn about hardware limitations without disabling I/O or possibly time consuming hardware preparations.

The contents of struct v4l2_pix_format and struct v4l2_pix_format_mplane are discussed in Image Formats. See also the specification of the VIDIOC_G_FMT, VIDIOC_S_FMT and VIDIOC_TRY_FMT ioctls for details. Video output devices must implement both the VIDIOC_G_FMT and VIDIOC_S_FMT ioctl, even if VIDIOC_S_FMT ignores all requests and always returns default parameters as VIDIOC_G_FMT does. VIDIOC_TRY_FMT is optional.

Writing Images

A video output device may support the write() function and/or streaming (memory mapping or user pointer) I/O. See Input/Output for details.

Video Output Overlay Interface

Also known as On-Screen Display (OSD)

Some video output devices can overlay a framebuffer image onto the outgoing video signal. Applications can set up such an overlay using this interface, which borrows structures and ioctls of the Video Overlay interface.

The OSD function is accessible through the same character special file as the Video Output function.

Note:

The default function of such a /dev/video device is video capturing or output. The OSD function is only available after calling the VIDIOC_S_FMT ioctl.
Querying Capabilities

Devices supporting the Video Output Overlay interface set the V4L2_CAP_VIDEO_OUTPUT_OVERLAY flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl.

Framebuffer

Contrary to the Video Overlay interface the framebuffer is normally implemented on the TV card and not the graphics card. On Linux it is accessible as a framebuffer device (/dev/fbN). Given a V4L2 device, applications can find the corresponding framebuffer device by calling the VIDIOC_G_FBUF ioctl. It returns, amongst other information, the physical address of the framebuffer in the base field of struct v4l2_framebuffer. The framebuffer device ioctl FBIOGET_FSCREENINFO returns the same address in the smem_start field of struct struct fb_fix_screeninfo. The FBIOGET_FSCREENINFO ioctl and struct struct fb_fix_screeninfo are defined in the linux/fb.h header file.

The width and height of the framebuffer depends on the current video standard. A V4L2 driver may reject attempts to change the video standard (or any other ioctl which would imply a framebuffer size change) with an EBUSY error code until all applications closed the framebuffer device.

Example: Finding a framebuffer device for OSD

```c
#include <linux/fb.h>

struct v4l2_framebuffer fbuf;
unsigned int i;
int fb_fd;

if (-1 == ioctl(fd, VIDIOC_G_FBUF, &fbuf)) {
    perror("VIDIOC_G_FBUF");
    exit(EXIT_FAILURE);
}

for (i = 0; i < 30; i++) {
    char dev_name[16];
    struct fb_fix_screeninfo si;
    snprintf(dev_name, sizeof(dev_name), "/dev/fb%u", i);

    fb_fd = open(dev_name, O_RDWR);
    if (-1 == fb_fd) {
        switch (errno) {
            case ENOENT: /* no such file */
            case ENXIO: /* no driver */
                continue;
            default:
                perror("open");
                exit(EXIT_FAILURE);
        }
    }

    if (0 == ioctl(fb_fd, FBIOGET_FSCREENINFO, &si)) {
        if (si.smem_start == (unsigned long)fbuf.base)
            break;
    } else {
        /* Apparently not a framebuffer device. */
    }

    close(fb_fd);
```
fb_fd = -1;
}

/* fb_fd is the file descriptor of the framebuffer device
for the video output overlay, or -1 if no device was found. */

**Overlay Window and Scaling**

The overlay is controlled by source and target rectangles. The source rectangle selects a subsection of the framebuffer image to be overlaid, the target rectangle an area in the outgoing video signal where the image will appear. Drivers may or may not support scaling, and arbitrary sizes and positions of these rectangles. Further drivers may support any (or none) of the clipping/blending methods defined for the **Video Overlay** interface.

A struct `v4l2_window` defines the size of the source rectangle, its position in the framebuffer and the clipping/blending method to be used for the overlay. To get the current parameters applications set the type field of a struct `v4l2_format` to `V4L2_BUF_TYPE_VIDEO_OUTPUT_OVERLAY` and call the `VIDIOC_G_FMT` ioctl. The driver fills the `struct v4l2_window` substructure named `win`. It is not possible to retrieve a previously programmed clipping list or bitmap.

To program the source rectangle applications set the type field of a struct `v4l2_format` to `V4L2_BUF_TYPE_VIDEO_OUTPUT_OVERLAY`, initialize the `win` substructure and call the `VIDIOC_S_FMT` ioctl. The driver adjusts the parameters against hardware limits and returns the actual parameters as `VIDIOC_G_FMT` does. Like `VIDIOC_S_FMT`, the `VIDIOC_TRY_FMT` ioctl can be used to learn about driver capabilities without actually changing driver state. Unlike `VIDIOC_S_FMT` this also works after the overlay has been enabled.

A struct `v4l2_crop` defines the size and position of the target rectangle. The scaling factor of the overlay is implied by the width and height given in struct `v4l2_window` and struct `v4l2_crop`. The cropping API applies to **Video Output** and **Video Output Overlay** devices in the same way as to **Video Capture** and **Video Overlay** devices, merely reversing the direction of the data flow. For more information see **Image Cropping, Insertion and Scaling**.

**Enabling Overlay**

There is no V4L2 ioctl to enable or disable the overlay, however the framebuffer interface of the driver may support the `FBIOBLANK` ioctl.

**Codec Interface**

A V4L2 codec can compress, decompress, transform, or otherwise convert video data from one format into another format, in memory. Typically such devices are memory-to-memory devices (i.e. devices with the `V4L2_CAP_VIDEO_M2M` or `V4L2_CAP_VIDEO_M2M_MPLANE` capability set).

A memory-to-memory video node acts just like a normal video node, but it supports both output (sending frames from memory to the codec hardware) and capture (receiving the processed frames from the codec hardware into memory) stream I/O. An application will have to setup the stream I/O for both sides and finally call `VIDIOC_STREAMON` for both capture and output to start the codec.

Video compression codecs use the MPEG controls to setup their codec parameters

---

**Note:**

The MPEG controls actually support many more codecs than just MPEG. See Codec Control Reference.
Memory-to-memory devices can often be used as a shared resource: you can open the video node multiple times, each application setting up their own codec properties that are local to the file handle, and each can use it independently from the others. The driver will arbitrate access to the codec and reprogram it whenever another file handler gets access. This is different from the usual video node behavior where the video properties are global to the device (i.e. changing something through one file handle is visible through another file handle).

**Effect Devices Interface**

*Note:*

This interface has been suspended from the V4L2 API. The implementation for such effects should be done via mem2mem devices.

A V4L2 video effect device can do image effects, filtering, or combine two or more images or image streams. For example video transitions or wipes. Applications send data to be processed and receive the result data either with `read()` and `write()` functions, or through the streaming I/O mechanism.

[to do]

**Raw VBI Data Interface**

VBI is an abbreviation of Vertical Blanking Interval, a gap in the sequence of lines of an analog video signal. During VBI no picture information is transmitted, allowing some time while the electron beam of a cathode ray tube TV returns to the top of the screen. Using an oscilloscope you will find here the vertical synchronization pulses and short data packages ASK modulated \(^1\) onto the video signal. These are transmissions of services such as Teletext or Closed Caption.

Subject of this interface type is raw VBI data, as sampled off a video signal, or to be added to a signal for output. The data format is similar to uncompressed video images, a number of lines times a number of samples per line, we call this a VBI image.

Conventionally V4L2 VBI devices are accessed through character device special files named `/dev/vbi` and `/dev/vbi0` to `/dev/vbi31` with major number 81 and minor numbers 224 to 255. `/dev/vbi` is typically a symbolic link to the preferred VBI device. This convention applies to both input and output devices.

To address the problems of finding related video and VBI devices VBI capturing and output is also available as device function under `/dev/video`. To capture or output raw VBI data with these devices applications must call the `VIDIOC_S_FMT` ioctl. Accessed as `/dev/vbi`, raw VBI capturing or output is the default device function.

**Querying Capabilities**

Devices supporting the raw VBI capturing or output API set the `V4L2_CAP_VBI_CAPTURE` or `V4L2_CAP_VBI_OUTPUT` flags, respectively, in the capabilities field of struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl. At least one of the read/write, streaming or asynchronous I/O methods must be supported. VBI devices may or may not have a tuner or modulator.

**Supplemental Functions**

VBI devices shall support `video input or output`, `tuner or modulator`, and `controls` ioctls as needed. The `video standard` ioctls provide information vital to program a VBI device, therefore must be supported.

\(^1\) ASK: Amplitude-Shift Keying. A high signal level represents a ‘1’ bit, a low level a ‘0’ bit.
Raw VBI Format Negotiation

Raw VBI sampling abilities can vary, in particular the sampling frequency. To properly interpret the data V4L2 specifies an ioctl to query the sampling parameters. Moreover, to allow for some flexibility applications can also suggest different parameters.

As usual these parameters are not reset at `open()` time to permit Unix tool chains, programming a device and then reading from it as if it was a plain file. Well written V4L2 applications should always ensure they really get what they want, requesting reasonable parameters and then checking if the actual parameters are suitable.

To query the current raw VBI capture parameters applications set the type field of a struct `v4l2_format` to `V4L2_BUF_TYPE_VBI_CAPTURE` or `V4L2_BUF_TYPE_VBI_OUTPUT`, and call the `VIDIOC_G_FMT` ioctl with a pointer to this structure. Drivers fill the struct `v4l2_vbi_format` vbi member of the fmt union.

To request different parameters applications set the type field of a struct `v4l2_format` as above and initialize all fields of the struct `v4l2_vbi_format` vbi member of the fmt union, or better just modify the results of `VIDIOC_G_FMT`, and call the `VIDIOC_S_FMT` ioctl with a pointer to this structure. Drivers return an EINVAL error code only when the given parameters are ambiguous, otherwise they modify the parameters according to the hardware capabilities and return the actual parameters. When the driver allocates resources at this point, it may return an EBUSY error code to indicate the returned parameters are valid but the required resources are currently not available. That may happen for instance when the video and VBI areas to capture would overlap, or when the driver supports multiple opens and another process already requested VBI capturing or output. Anyway, applications must expect other resource allocation points which may return EBUSY, at the `ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF` ioctl and the first `read()`, `write()` and `select()` calls.

VBI devices must implement both the `VIDIOC_G_FMT` and `VIDIOC_S_FMT` ioctl, even if `VIDIOC_S_FMT` ignores all requests and always returns default parameters as `VIDIOC_G_FMT` does. `VIDIOC_TRY_FMT` is optional.

<td>Horizontal offset of the VBI image, relative to the leading edge of the line synchronization pulse and counted in samples: The first sample in the VBI image will be located offset / sampling_rate seconds following the leading edge. See also Figure 4.1. Line synchronization.</td>
</tr>
<tr>
<td>__u32</td>
<td>samples_per_line</td>
<td></td>
</tr>
<tr>
<td>__u32</td>
<td>sample_format</td>
<td>Defines the sample format as in Image Formats, a four-character-code. Usually this is V4L2_PIX_FMT_GREY, i.e. each sample consists of 8 bits with lower values oriented towards the black level. Do not assume any other correlation of values with the signal level. For example, the MSB does not necessarily indicate if the signal is ‘high’ or ‘low’ because 128 may not be the mean value of the signal. Drivers shall not convert the sample format by software.</td>
</tr>
</tbody>
</table>

Continued on next page
Table 1.28 – continued from previous page

| __u32 | start² | This is the scanning system line number associated with the first line of the VBI image, of the first and the second field respectively. See Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL) and Figure 4.3. ITU-R 625 line numbering for valid values. The V4L2_VBI_ITU_525_F1_START, V4L2_VBI_ITU_525_F2_START, V4L2_VBI_ITU_625_F1_START and V4L2_VBI_ITU_625_F2_START defines give the start line numbers for each field for each 525 or 625 line format as a convenience. Don’t forget that ITU line numbering starts at 1, not 0. VBI input drivers can return start values 0 if the hardware cannot reliably identify scanning lines, VBI acquisition may not require this information. |
| __u32 | count² | The number of lines in the first and second field image, respectively. |
|       |        | Drivers should be as flexibility as possible. For example, it may be possible to extend or move the VBI capture window down to the picture area, implementing a ‘full field mode’ to capture data service transmissions embedded in the picture. |
|       |        | An application can set the first or second count value to zero if no data is required from the respective field; count[1] if the scanning system is progressive, i.e. not interlaced. The corresponding start value shall be ignored by the application and driver. Anyway, drivers may not support single field capturing and return both count values non-zero. |
|       |        | Both count values set to zero, or line numbers are outside the bounds depicted⁴, or a field image covering lines of two fields, are invalid and shall not be returned by the driver. |
|       |        | To initialize the start and count fields, applications must first determine the current video standard selection. The v4l2_std_id or the framelines field of struct v4l2_standard can be evaluated for this purpose. |
| __u32 | flags | See Raw VBI Format Flags below. Currently only drivers set flags, applications must set this field to zero. |
| __u32 | reserved² | This array is reserved for future extensions. Drivers and applications must set it to zero. |

---

² A few devices may be unable to sample VBI data at all but can extend the video capture window to the VBI region. 
⁴ The valid values are shown at Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL) and Figure 4.3. ITU-R 625 line numbering.

</thead>
<tbody>
<tr>
<td>V4L2_VBI_UNSYNC</td>
<td>0x0001</td>
<td>This flag indicates hardware which does not properly distinguish between fields. Normally the VBI image stores the first field (lower scanning line numbers) first in memory. This may be a top or bottom field depending on the video standard. When this flag is set the first or second field may be stored first, however the fields are still in correct temporal order with the older field first in memory.</td>
</tr>
<tr>
<td>V4L2_VBI_INTERLACED</td>
<td>0x0002</td>
<td>By default the two field images will be passed sequentially; all lines of the first field followed by all lines of the second field (compare Field Order V4L2_FIELD_SEQ_TB and V4L2_FIELD_SEQ_BT, whether the top or bottom field is first in memory depends on the video standard). When this flag is set, the two fields are interlaced (cf. V4L2_FIELD_INTERLACED). The first line of the first field followed by the first line of the second field, then the two second lines, and so on. Such a layout may be necessary when the hardware has been programmed to capture or output interlaced video images and is unable to separate the fields for VBI capturing at the same time. For simplicity setting this flag implies that both count values are equal and non-zero.</td>
</tr>
</tbody>
</table>

Fig. 1.6: Figure 4.1. Line synchronization

Fig. 1.7: Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL)

Remember the VBI image format depends on the selected video standard, therefore the application must choose a new standard or query the current standard first. Attempts to read or write data ahead of format negotiation, or after switching the video standard which may invalidate the negotiated VBI parameters, should be refused by the driver. A format change during active I/O is not permitted.

3 Most VBI services transmit on both fields, but some have different semantics depending on the field number. These cannot be reliable decoded or encoded when V4L2_VBI_UNSYNC is set.
Reading and writing VBI images

To assure synchronization with the field number and easier implementation, the smallest unit of data passed at a time is one frame, consisting of two fields of VBI images immediately following in memory. The total size of a frame computes as follows:

\[(\text{count}_0 + \text{count}_1) \times \text{samples\_per\_line} \times \text{sample\_size\_in\_bytes}\]

The sample size is most likely always one byte, applications must check the sample_format field though, to function properly with other drivers.

A VBI device may support read/write and/or streaming (memory mapping or user pointer) I/O. The latter bears the possibility of synchronizing video and VBI data by using buffer timestamps.

Remember the VIDIOC_STREAMON ioctl and the first read(), write() and select() call can be resource allocation points returning an EBUSY error code if the required hardware resources are temporarily unavailable, for example the device is already in use by another process.

Sliced VBI Data Interface

VBI stands for Vertical Blanking Interval, a gap in the sequence of lines of an analog video signal. During VBI no picture information is transmitted, allowing some time while the electron beam of a cathode ray tube TV returns to the top of the screen.

Sliced VBI devices use hardware to demodulate data transmitted in the VBI. V4L2 drivers shall not do this by software, see also the raw VBI interface. The data is passed as short packets of fixed size, covering one scan line each. The number of packets per video frame is variable.

Sliced VBI capture and output devices are accessed through the same character special files as raw VBI devices. When a driver supports both interfaces, the default function of a /dev/vbi device is raw VBI capturing or output, and the sliced VBI function is only available after calling the VIDIOC_S_FMT ioctl as defined below. Likewise a /dev/video device may support the sliced VBI API, however the default function here is video capturing or output. Different file descriptors must be used to pass raw and sliced VBI data simultaneously, if this is supported by the driver.

Querying Capabilities

Devices supporting the sliced VBI capturing or output API set the V4L2_CAP_SLICED_VBI_CAPTURE or V4L2_CAP_SLICED_VBI_OUTPUT flag respectively, in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. At least one of the read/write, streaming or asynchronous I/O methods must be supported. Sliced VBI devices may have a tuner or modulator.
Supplemental Functions

Sliced VBI devices shall support video input or output and tuner or modulator ioctls if they have these capabilities, and they may support User Controls ioctls. The video standard ioctls provide information vital to program a sliced VBI device, therefore must be supported.

Sliced VBI Format Negotiation

To find out which data services are supported by the hardware applications can call the VIDIOC_G_SLICED_VBI_CAP ioctl. All drivers implementing the sliced VBI interface must support this ioctl. The results may differ from those of the VIDIOC_S_FMT ioctl when the number of VBI lines the hardware can capture or output per frame, or the number of services it can identify on a given line are limited. For example on PAL line 16 the hardware may be able to look for a VPS or Teletext signal, but not both at the same time.

To determine the currently selected services applications set the type field of struct v4l2_format to V4L2_BUF_TYPE_SLICED_VBI_CAPTURE or V4L2_BUF_TYPE_SLICED_VBI_OUTPUT, and the VIDIOC_G_FMT ioctl fills the fmt.sliced member, a struct v4l2_sliced_vbi_format.

Applications can request different parameters by initializing or modifying the fmt.sliced member and calling the VIDIOC_S_FMT ioctl with a pointer to the struct v4l2_format structure.

The sliced VBI API is more complicated than the raw VBI API because the hardware must be told which VBI service to expect on each scan line. Not all services may be supported by the hardware on all lines (this is especially true for VBI output where Teletext is often unsupported and other services can only be inserted in one specific line). In many cases, however, it is sufficient to just set the service_set field to the required services and let the driver fill the service_lines array according to hardware capabilities. Only if more precise control is needed should the programmer set the service_lines array explicitly.

The VIDIOC_S_FMT ioctl modifies the parameters according to hardware capabilities. When the driver allocates resources at this point, it may return an EBUSY error code if the required resources are temporarily unavailable. Other resource allocation points which may return EBUSY can be the ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF ioctl and the first read(), write() and select() call.

struct v4l2_sliced_vbi_format

<table>
<thead>
<tr>
<th>u32</th>
<th>service_set</th>
</tr>
</thead>
</table>
| If service_set is non-zero when passed with VIDIOC_S_FMT or VIDIOC_TRY_FMT, the service_lines array will be filled by the driver according to the services specified in this field. For example, if service_set is initialized with V4L2_SLICED_TELETEXT_B | V4L2_SLICED_WSS_625, a driver for the cx25840 video decoder sets lines 7-22 of both fields to V4L2_SLICED_TELETEXT_B and line 23 of the first field to V4L2_SLICED_WSS_625. If service_set is set to zero, then the values of service_lines will be used instead.

On return the driver sets this field to the union of all elements of the returned service_lines array. It may contain less services than requested, perhaps just one, if the hardware cannot handle more services simultaneously. It may be empty (zero) if none of the requested services are supported by the hardware. |

Drivers may return an EINVAL error code when applications attempt to read or write data without prior format negotiation, after switching the video standard (which may invalidate the negotiated VBI parameters) and after switching the video input (which may change the video standard as a side effect). The VIDIOC_S_FMT ioctl may return an EBUSY error code when applications attempt to change the format while i/o is in progress (between a ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF and VIDIOC_STREAMOFF call, and after the first read() or write() call).

Reading and writing sliced VBI data

A single read() or write() call must pass all data belonging to one video frame. That is an array of struct v4l2_sliced_vbi_data structures with one or more elements and a total size not exceeding io_size bytes. Likewise in streaming I/O mode one buffer of io_size bytes must contain data of one video frame. The id of unused struct v4l2_sliced_vbi_data elements must be zero.

---

1 According to ETS 300 706 lines 6-22 of the first field and lines 5-22 of the second field may carry Teletext data.

2 See also Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL) and Figure 4.3. ITU-R 625 line numbering.
struct v4l2_sliced_vbi_data

| __u32          | id          | A flag from Sliced VBI services identifying the type of data in this packet. Only a single bit must be set. When the id of a captured packet is zero, the packet is empty and the contents of other fields are undefined. Applications shall ignore empty packets. When the id of a packet for output is zero the contents of the data field are undefined and the driver must no longer insert data on the requested field and line. |
| __u32          | field       | The video field number this data has been captured from, or shall be inserted at. 0 for the first field, 1 for the second field. |
| __u32          | line        | The field (as opposed to frame) line number this data has been captured from, or shall be inserted at. See Figure 4.2. ITU-R 525 line numbering (M/NTSC and M/PAL) and Figure 4.3. ITU-R 625 line numbering for valid values. Sliced VBI capture devices can set the line number of all packets to 0 if the hardware cannot reliably identify scan lines. The field number must always be valid. |
| __u32          | reserved    | This field is reserved for future extensions. Applications and drivers must set it to zero. |
| __u8           | data[48]    | The packet payload. See Sliced VBI services for the contents and number of bytes passed for each data type. The contents of padding bytes at the end of this array are undefined, drivers and applications shall ignore them. |

Packets are always passed in ascending line number order, without duplicate line numbers. The write() function and the ioctl VIDIOC_QBUF, VIDIOC_DQBUF ioctl must return an EINVAL error code when applications violate this rule. They must also return an EINVAL error code when applications pass an incorrect field or line number, or a combination of field, line and id which has not been negotiated with the VIDIOC_G_FMT or VIDIOC_S_FMT ioctl. When the line numbers are unknown the driver must pass the packets in transmitted order. The driver can insert empty packets with id set to zero anywhere in the packet array.

To assure synchronization and to distinguish from frame dropping, when a captured frame does not carry any of the requested data services drivers must pass one or more empty packets. When an application fails to pass VBI data in time for output, the driver must output the last VPS and WSS packet again, and disable the output of Closed Caption and Teletext data, or output data which is ignored by Closed Caption and Teletext decoders.

A sliced VBI device may support read/write and/or streaming (memory mapping and/or user pointer) I/O. The latter bears the possibility of synchronizing video and VBI data by using buffer timestamps.

Sliced VBI Data in MPEG Streams

If a device can produce an MPEG output stream, it may be capable of providing negotiated sliced VBI services as data embedded in the MPEG stream. Users or applications control this sliced VBI data insertion with the V4L2_CID_MPEG STREAM_VBI_FMT control.

If the driver does not provide the V4L2_CID_MPEG_STREAM_VBI_FMT control, or only allows that control to be set to V4L2_MPEG_STREAM_VBI_FMT_NONE, then the device cannot embed sliced VBI data in the MPEG stream.

The V4L2_CID_MPEG_STREAM_VBI_FMT control does not implicitly set the device driver to capture nor cease capturing sliced VBI data. The control only indicates to embed sliced VBI data in the MPEG stream,
if an application has negotiated sliced VBI service be captured.

It may also be the case that a device can embed sliced VBI data in only certain types of MPEG streams: for example in an MPEG-2 PS but not an MPEG-2 TS. In this situation, if sliced VBI data insertion is requested, the sliced VBI data will be embedded in MPEG stream types when supported, and silently omitted from MPEG stream types where sliced VBI data insertion is not supported by the device.

The following subsections specify the format of the embedded sliced VBI data.

**MPEG Stream Embedded, Sliced VBI Data Format: NONE**

The V4L2_MPEG_STREAM_VBI_FMT_NONE embedded sliced VBI format shall be interpreted by drivers as a control to cease embedding sliced VBI data in MPEG streams. Neither the device nor driver shall insert “empty” embedded sliced VBI data packets in the MPEG stream when this format is set. No MPEG stream data structures are specified for this format.

**MPEG Stream Embedded, Sliced VBI Data Format: IVTV**

The V4L2_MPEG_STREAM_VBI_FMT_IVTV embedded sliced VBI format, when supported, indicates to the driver to embed up to 36 lines of sliced VBI data per frame in an MPEG-2 Private Stream 1 PES packet encapsulated in an MPEG-2 Program Pack in the MPEG stream.

**Historical context:** This format specification originates from a custom, embedded, sliced VBI data format used by the ivtv driver. This format has already been informally specified in the kernel sources in the file Documentation/video4linux/cx2341x/README.vbi. The maximum size of the payload and other aspects of this format are driven by the CX23415 MPEG decoder’s capabilities and limitations with respect to extracting, decoding, and displaying sliced VBI data embedded within an MPEG stream.

This format’s use is not exclusive to the ivtv driver nor exclusive to CX2341x devices, as the sliced VBI data packet insertion into the MPEG stream is implemented in driver software. At least the cx18 driver provides sliced VBI data insertion into an MPEG-2 PS in this format as well.

The following definitions specify the payload of the MPEG-2 Private Stream 1 PES packets that contain sliced VBI data when V4L2_MPEG_STREAM_VBI_FMT_IVTV is set. (The MPEG-2 Private Stream 1 PES packet header and encapsulating MPEG-2 Program Pack header are not detailed here. Please refer to the MPEG-2 specifications for details on those packet headers.)

The payload of the MPEG-2 Private Stream 1 PES packets that contain sliced VBI data is specified by struct v4l2_mpeg_vbi_fmt_ivtv. The payload is variable length, depending on the actual number of lines of sliced VBI data present in a video frame. The payload may be padded at the end with unspecified fill bytes to align the end of the payload to a 4-byte boundary. The payload shall never exceed 1552 bytes (2 fields with 18 lines/field with 43 bytes of data/line and a 4 byte magic number).

**struct v4l2_mpeg_vbi_fmt_ivtv**

| _u8 magic[4] | A “magic” constant from Magic Constants for struct v4l2_mpeg_vbi_fmt_ivtv magic field that indicates this is a valid sliced VBI data payload and also indicates which member of the anonymous union, itv0 or ITV0, to use for the payload data. |
| union (anonymous) |  |
| struct v4l2_mpeg_vbi_itv0 | ITV0 | The primary form of the sliced VBI data payload that contains anywhere from 1 to 35 lines of sliced VBI data. Line masks are provided in this form of the payload indicating which VBI lines are provided. |
| struct v4l2_mpeg_vbi_ITV0 | ITV0 | An alternate form of the sliced VBI data payload used when 36 lines of sliced VBI data are present. No line masks are provided in this form of the payload; all valid line mask bits are implicitly set. |
## Magic Constants for struct `v4l2_mpeg_vbi_fmt_ivtv` magic field

<table>
<thead>
<tr>
<th>Defined Symbol</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_MPEG_VBI_IVTV_MAGIC0</td>
<td>„itv0“</td>
<td>Indicates the <code>itv0</code> member of the union in struct <code>v4l2_mpeg_vbi_fmt_ivtv</code> is valid.</td>
</tr>
<tr>
<td>V4L2_MPEG_VBI_IVTV_MAGIC1</td>
<td>„ITV0“</td>
<td>Indicates the <code>ITV0</code> member of the union in struct <code>v4l2_mpeg_vbi_fmt_ivtv</code> is valid and that 36 lines of sliced VBI data are present.</td>
</tr>
</tbody>
</table>

### struct `v4l2_mpeg_vbi_itv0`

- **__le32**
  - `linemask[2]` Bitmasks indicating the VBI service lines present. These `linemask` values are stored in little endian byte order in the MPEG stream. Some reference `linemask` bit positions with their corresponding VBI line number and video field are given below. `b0` indicates the least significant bit of a `linemask` value:
    - `linemask[0]` b0: line 6 first field
    - `linemask[0]` b17: line 23 first field
    - `linemask[0]` b18: line 6 second field
    - `linemask[0]` b31: line 19 second field
    - `linemask[1]` b0: line 20 second field
    - `linemask[1]` b3: line 23 second field
    - `linemask[1]` b4-b31: unused and set to 0

- **struct `v4l2_mpeg_vbi_itv0_line`**
  - `line[35]` This is a variable length array that holds from 1 to 35 lines of sliced VBI data. The sliced VBI data lines present correspond to the bits set in the `linemask` array, starting from `b0` of `linemask[0]` up through `b31` of `linemask[0]`, and from `b0` of `linemask[1]` up through `b3` of `linemask[1]`. `line[0]` corresponds to the first bit found set in the `linemask` array, `line[1]` corresponds to the second bit found set in the `linemask` array, etc. If no `linemask` array bits are set, then `line[0]` may contain one line of unspecified data that should be ignored by applications.

### struct `v4l2_mpeg_vbi_ITV0`

- **struct `v4l2_mpeg_vbi_itv0_line`**

### struct `v4l2_mpeg_vbi_itv0_line`

- **__u8**
  - `id` A line identifier value from `Line Identifiers for struct v4l2_mpeg_vbi_itv0_line id field` that indicates the type of sliced VBI data stored on this line.
  - `__u8` `data[42]` The sliced VBI data for the line.
Line Identifiers for struct v4l2_mpeg_vbi_itv0_lineid field

Teletext Interface

This interface was aimed at devices receiving and demodulating Teletext data [ETS 300 706, ITU BT.653], evaluating the Teletext packages and storing formatted pages in cache memory. Such devices are usually implemented as microcontrollers with serial interface (I:sup:2C) and could be found on old TV cards, dedicated Teletext decoding cards and home-brew devices connected to the PC parallel port.

The Teletext API was designed by Martin Buck. It was defined in the kernel header file linux/videotext.h, the specification is available from ftp://ftp.gwdg.de/pub/linux/misc/videotext/. (Videotext is the name of the German public television Teletext service.)

Eventually the Teletext API was integrated into the V4L API with character device file names /dev/vtx0 to /dev/vtx31, device major number 81, minor numbers 192 to 223.

However, teletext decoders were quickly replaced by more generic VBI demodulators and those dedicated teletext decoders no longer exist. For many years the vtx devices were still around, even though nobody used them. So the decision was made to finally remove support for the Teletext API in kernel 2.6.37.

Modern devices all use the raw or Sliced VBI Data Interface VBI API.

Radio Interface

This interface is intended for AM and FM (analog) radio receivers and transmitters.

Conventionally V4L2 radio devices are accessed through character device special files named /dev/radio and /dev/radio0 to /dev/radio63 with major number 81 and minor numbers 64 to 127.

Querying Capabilities

Devices supporting the radio interface set the V4L2_CAP_RADIO and V4L2_CAP_TUNER or V4L2_CAP_MODULATOR flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. Other combinations of capability flags are reserved for future extensions.

Supplemental Functions

Radio devices can support controls, and must support the tuner or modulator ioctls.

They do not support the video input or output, audio input or output, video standard, cropping and scaling, compression and streaming parameter, or overlay ioctls. All other ioctls and I/O methods are reserved for future extensions.
Programming

Radio devices may have a couple audio controls (as discussed in User Controls) such as a volume control, possibly custom controls. Further all radio devices have one tuner or modulator (these are discussed in Tuners and Modulators) with index number zero to select the radio frequency and to determine if a monaural or FM stereo program is received/emitted. Drivers switch automatically between AM and FM depending on the selected frequency. The VIDIOC_G_TUNER or VIDIOC_G_MODULATOR ioctl reports the supported frequency range.

RDS Interface

The Radio Data System transmits supplementary information in binary format, for example the station name or travel information, on an inaudible audio subcarrier of a radio program. This interface is aimed at devices capable of receiving and/or transmitting RDS information.

For more information see the core RDS standard IEC 62106 and the RBDS standard NRSC-4-B.

Note:

Note that the RBDS standard as is used in the USA is almost identical to the RDS standard. Any RDS decoder/encoder can also handle RBDS. Only some of the fields have slightly different meanings. See the RBDS standard for more information.

The RBDS standard also specifies support for MMBS (Modified Mobile Search). This is a proprietary format which seems to be discontinued. The RDS interface does not support this format. Should support for MMBS (or the so-called ‘E blocks’ in general) be needed, then please contact the linux-media mailing list: https://linuxtv.org/lists.php.

Querying Capabilities

Devices supporting the RDS capturing API set the V4L2_CAP_RDS_CAPTURE flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. Any tuner that supports RDS will set the V4L2_TUNER_CAP_RDS flag in the capability field of struct v4l2_tuner. If the driver only passes RDS blocks without interpreting the data the V4L2_TUNER_CAP_RDS_BLOCK_0 flag has to be set, see Reading RDS data. For future use the flag V4L2_TUNER_CAP_RDS_CONTROLS has also been defined. However, a driver for a radio tuner with this capability does not yet exist, so if you are planning to write such a driver you should discuss this on the linux-media mailing list: https://linuxtv.org/lists.php.

Whether an RDS signal is present can be detected by looking at the rxsubchans field of struct v4l2_tuner: the V4L2_TUNER_SUB_RDS will be set if RDS data was detected.

Devices supporting the RDS output API set the V4L2_CAP_RDS_OUTPUT flag in the capabilities field of struct v4l2_capability returned by the ioctl VIDIOC_QUERYCAP ioctl. Any modulator that supports RDS will set the V4L2_TUNER_CAP_RDS flag in the capability field of struct v4l2_modulator. In order to enable the RDS transmission one must set the V4L2_TUNER_SUB_RDS bit in the txsubchans field of struct v4l2_modulator. If the driver only passes RDS blocks without interpreting the data the V4L2_TUNER_CAP_RDS_BLOCK_0 flag has to be set. If the tuner is capable of handling RDS entities like program identification codes and radio text, the flag V4L2_TUNER_CAP_RDS_CONTROLS should be set, see Writing RDS data and FM Transmitter Control Reference.

Reading RDS data

RDS data can be read from the radio device with the read() function. The data is packed in groups of three bytes.
Writing RDS data

RDS data can be written to the radio device with the `write()` function. The data is packed in groups of three bytes, as follows:

Software Defined Radio Interface (SDR)

SDR is an abbreviation of Software Defined Radio, the radio device which uses application software for modulation or demodulation. This interface is intended for controlling and data streaming of such devices.

SDR devices are accessed through character device special files named `/dev/swradio0` to `/dev/swradio255` with major number 81 and dynamically allocated minor numbers 0 to 255.

Querying Capabilities

Devices supporting the SDR receiver interface set the `V4L2_CAP_SDR_CAPTURE` and `V4L2_CAP_TUNER` flag in the capabilities field of struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl. That flag means the device has an Analog to Digital Converter (ADC), which is a mandatory element for the SDR receiver.

Devices supporting the SDR transmitter interface set the `V4L2_CAP_SDR_OUTPUT` and `V4L2_CAP_MODULATOR` flag in the capabilities field of struct `v4l2_capability` returned by the `ioctl VIDIOC_QUERYCAP` ioctl. That flag means the device has a Digital to Analog Converter (DAC), which is a mandatory element for the SDR transmitter.

At least one of the read/write, streaming or asynchronous I/O methods must be supported.
Supplemental Functions

SDR devices can support controls, and must support the Tuners and Modulators ioctls. Tuner ioctls are used for setting the ADC/DAC sampling rate (sampling frequency) and the possible radio frequency (RF). The V4L2_TUNER_SDR tuner type is used for setting SDR device ADC/DAC frequency, and the V4L2_TUNER_RF tuner type is used for setting radio frequency. The tuner index of the RF tuner (if any) must always follow the SDR tuner index. Normally the SDR tuner is #0 and the RF tuner is #1.

The ioctl VIDIOC_S_HW_FREQ_SEEK ioctl is not supported.

Data Format Negotiation

The SDR device uses the Data Formats ioctls to select the capture and output format. Both the sampling resolution and the data streaming format are bound to that selectable format. In addition to the basic Data Formats ioctls, the ioctl VIDIOC_ENUM_FMT ioctl must be supported as well.

To use the Data Formats ioctls applications set the type field of a struct v4l2_format to V4L2_BUF_TYPE_SDR_CAPTURE or V4L2_BUF_TYPE_SDR_OUTPUT and use the struct v4l2_sdr_format sdr member of the fmt union as needed per the desired operation. Currently there is two fields, pixelformat and buffersize, of struct struct v4l2_sdr_format which are used. Content of the pixelformat is V4L2 FourCC code of the data format. The buffersize field is maximum buffer size in bytes required for data transfer, set by the driver in order to inform application.

<table>
<thead>
<tr>

</tr>
<tr>
<td>__u8 reserved[24]</td>
<td>This array is reserved for future extensions. Drivers and applications must set it to zero.</td>
</tr>
</tbody>
</table>

An SDR device may support read/write and/or streaming (memory mapping or user pointer) I/O.

Event Interface

The V4L2 event interface provides a means for a user to get immediately notified on certain conditions taking place on a device. This might include start of frame or loss of signal events, for example. Changes in the value or state of a V4L2 control can also be reported through events.

To receive events, the events the user is interested in first must be subscribed using the ioctl VIDIOC_SUBSCRIBE_EVENT, VIDIOC_UNSUBSCRIBE_EVENT ioctl. Once an event is subscribed, the events of subscribed types are dequeueable using the ioctl VIDIOC_DQEVENT ioctl. Events may be unsubscribed using VIDIOC_UNSUBSCRIBE_EVENT ioctl. The special event type V4L2_EVENT_ALL may be used to unsubscribe all the events the driver supports.

The event subscriptions and event queues are specific to file handles. Subscribing an event on one file handle does not affect other file handles.

The information on dequeueable events is obtained by using select or poll system calls on video devices. The V4L2 events use POLLPRI events on poll system call and exceptions on select system call.

Starting with kernel 3.1 certain guarantees can be given with regards to events:

1. Each subscribed event has its own internal dedicated event queue. This means that flooding of one event type will not interfere with other event types.
2. If the internal event queue for a particular subscribed event becomes full, then the oldest event in that queue will be dropped.

3. Where applicable, certain event types can ensure that the payload of the oldest event that is about to be dropped will be merged with the payload of the next oldest event. Thus ensuring that no information is lost, but only an intermediate step leading up to that information. See the documentation for the event you want to subscribe to whether this is applicable for that event or not.

Sub-device Interface

The complex nature of V4L2 devices, where hardware is often made of several integrated circuits that need to interact with each other in a controlled way, leads to complex V4L2 drivers. The drivers usually reflect the hardware model in software, and model the different hardware components as software blocks called sub-devices.

V4L2 sub-devices are usually kernel-only objects. If the V4L2 driver implements the media device API, they will automatically inherit from media entities. Applications will be able to enumerate the sub-devices and discover the hardware topology using the media entities, pads and links enumeration API.

In addition to make sub-devices discoverable, drivers can also choose to make them directly configurable by applications. When both the sub-device driver and the V4L2 device driver support this, sub-devices will feature a character device node on which ioctls can be called to:

- query, read and write sub-devices controls
- subscribe and unsubscribe to events and retrieve them
- negotiate image formats on individual pads

Sub-device character device nodes, conventionally named /dev/v4l-subdev*, use major number 81.

Controls

Most V4L2 controls are implemented by sub-device hardware. Drivers usually merge all controls and expose them through video device nodes. Applications can control all sub-devices through a single interface.

Complex devices sometimes implement the same control in different pieces of hardware. This situation is common in embedded platforms, where both sensors and image processing hardware implement identical functions, such as contrast adjustment, white balance or faulty pixels correction. As the V4L2 controls API doesn’t support several identical controls in a single device, all but one of the identical controls are hidden.

Applications can access those hidden controls through the sub-device node with the V4L2 control API described in User Controls. The ioctls behave identically as when issued on V4L2 device nodes, with the exception that they deal only with controls implemented in the sub-device.

Depending on the driver, those controls might also be exposed through one (or several) V4L2 device nodes.

Events

V4L2 sub-devices can notify applications of events as described in Event Interface. The API behaves identically as when used on V4L2 device nodes, with the exception that it only deals with events generated by the sub-device. Depending on the driver, those events might also be reported on one (or several) V4L2 device nodes.
Pad-level Formats

**Warning:**

Pad-level formats are only applicable to very complex devices that need to expose low-level format configuration to user space. Generic V4L2 applications do not need to use the API described in this section.

**Note:**

For the purpose of this section, the term format means the combination of media bus data format, frame width and frame height.

Image formats are typically negotiated on video capture and output devices using the format and *selection* ioctls. The driver is responsible for configuring every block in the video pipeline according to the requested format at the pipeline input and/or output.

For complex devices, such as often found in embedded systems, identical image sizes at the output of a pipeline can be achieved using different hardware configurations. One such example is shown on Image Format Negotiation on Pipelines, where image scaling can be performed on both the video sensor and the host image processing hardware.

**Fig. 1.9: Image Format Negotiation on Pipelines**
High quality and high speed pipeline configuration

The sensor scaler is usually of less quality than the host scaler, but scaling on the sensor is required to achieve higher frame rates. Depending on the use case (quality vs. speed), the pipeline must be configured differently. Applications need to configure the formats at every point in the pipeline explicitly.

Drivers that implement the media API can expose pad-level image format configuration to applications. When they do, applications can use the `VIDIOC_SUBDEV_G_FMT` and `VIDIOC_SUBDEV_S_FMT` ioctls to negotiate formats on a per-pad basis.

Applications are responsible for configuring coherent parameters on the whole pipeline and making sure
that connected pads have compatible formats. The pipeline is checked for formats mismatch at VIDIOC_STREAMON time, and an EPIPE error code is then returned if the configuration is invalid.

Pad-level image format configuration support can be tested by calling the ioctl VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT ioctl on pad 0. If the driver returns an EINVAL error code pad-level format configuration is not supported by the sub-device.

Format Negotiation

Acceptable formats on pads can (and usually do) depend on a number of external parameters, such as formats on other pads, active links, or even controls. Finding a combination of formats on all pads in a video pipeline, acceptable to both application and driver, can’t rely on formats enumeration only. A format negotiation mechanism is required.

Central to the format negotiation mechanism are the get/set format operations. When called with the which argument set to V4L2_SUBDEV_FORMAT_TRY, the VIDIOC_SUBDEV_G_FMT and VIDIOC_SUBDEV_S_FMT ioctl operate on a set of formats parameters that are not connected to the hardware configuration. Modifying those ‘try’ formats leaves the device state untouched (this applies to both the software state stored in the driver and the hardware state stored in the device itself).

While not kept as part of the device state, try formats are stored in the sub-device file handles. A VIDIOC_SUBDEV_G_FMT call will return the last try format set on the same sub-device file handle. Several applications querying the same sub-device at the same time will thus not interact with each other.

To find out whether a particular format is supported by the device, applications use the VIDIOC_SUBDEV_S_FMT ioctl. Drivers verify and, if needed, change the requested format based on device requirements and return the possibly modified value. Applications can then choose to try a different format or accept the returned value and continue.

Formats returned by the driver during a negotiation iteration are guaranteed to be supported by the device. In particular, drivers guarantee that a returned format will not be further changed if passed to an VIDIOC_SUBDEV_S_FMT call as-is (as long as external parameters, such as formats on other pads or links’ configuration are not changed).

Drivers automatically propagate formats inside sub-devices. When a try or active format is set on a pad, corresponding formats on other pads of the same sub-device can be modified by the driver. Drivers are free to modify formats as required by the device. However, they should comply with the following rules when possible:

- Formats should be propagated from sink pads to source pads. Modifying a format on a source pad should not modify the format on any sink pad.
- Sub-devices that scale frames using variable scaling factors should reset the scale factors to default values when sink pads formats are modified. If the 1:1 scaling ratio is supported, this means that source pads formats should be reset to the sink pads formats.

Formats are not propagated across links, as that would involve propagating them from one sub-device file handle to another. Applications must then take care to configure both ends of every link explicitly with compatible formats. Identical formats on the two ends of a link are guaranteed to be compatible. Drivers are free to accept different formats matching device requirements as being compatible.

Sample Pipeline Configuration shows a sample configuration sequence for the pipeline described in Image Format Negotiation on Pipelines (table columns list entity names and pad numbers).

<table>
<thead>
<tr>
<th>Sensor format</th>
<th>Frontend format</th>
<th>Frontend format</th>
<th>Frontend format</th>
<th>Sensor composite selection rectangle</th>
<th>Scaler format</th>
</tr>
</thead>
<tbody>
<tr>
<td>2048x1536/SGRGB_1X8</td>
<td>2048x1536/SGRGB_1X8</td>
<td>2048x1536/SGRGB_1X8</td>
<td>0,0/1280x960</td>
<td>1280x960/SGRGB_1X8</td>
<td></td>
</tr>
</tbody>
</table>
1. **Initial state.** The sensor source pad format is set to its native 3MP size and V4L2_MBUS_FMT_SGRBG8_1X8 media bus code. Formats on the host frontend and scaler sink and source pads have the default values, as well as the compose rectangle on the scaler’s sink pad.

2. The application configures the frontend sink pad format’s size to 2048x1536 and its media bus code to V4L2_MBUS_FMT_SGRBG_1X8. The driver propagates the format to the frontend source pad.

3. The application configures the scaler sink pad format’s size to 2046x1534 and the media bus code to V4L2_MBUS_FMT_SGRBG_1X8 to match the frontend source size and media bus code. The media bus code on the sink pad is set to V4L2_MBUS_FMT_SGRBG_1X8. The driver propagates the size to the compose selection rectangle on the scaler’s sink pad, and the format to the scaler source pad.

4. The application configures the size of the compose selection rectangle of the scaler’s sink pad 1280x960. The driver propagates the size to the scaler’s source pad format.

When satisfied with the try results, applications can set the active formats by setting the `which` argument to V4L2_SUBDEV_FORMAT_ACTIVE. Active formats are changed exactly as try formats by drivers. To avoid modifying the hardware state during format negotiation, applications should negotiate try formats first and then modify the active settings using the try formats returned during the last negotiation iteration. This guarantees that the active format will be applied as-is by the driver without being modified.

**Selections: cropping, scaling and composition**

Many sub-devices support cropping frames on their input or output pads (or possible even on both). Cropping is used to select the area of interest in an image, typically on an image sensor or a video decoder. It can also be used as part of digital zoom implementations to select the area of the image that will be scaled up.

Crop settings are defined by a crop rectangle and represented in a struct `v4l2_rect` by the coordinates of the top left corner and the rectangle size. Both the coordinates and sizes are expressed in pixels.

As for pad formats, drivers store try and active rectangles for the selection targets. *Common selection definitions.*

On sink pads, cropping is applied relative to the current pad format. The pad format represents the image size as received by the sub-device from the previous block in the pipeline, and the crop rectangle represents the sub-image that will be transmitted further inside the sub-device for processing.

The scaling operation changes the size of the image by scaling it to new dimensions. The scaling ratio isn’t specified explicitly, but is implied from the original and scaled image sizes. Both sizes are represented by struct `v4l2_rect`.

Scaling support is optional. When supported by a subdev, the crop rectangle on the subdev’s sink pad is scaled to the size configured using the `VIDIOC_SUBDEV_S_SELECTION` IOCTL using V4L2_SEL_TGT_COMPOSE selection target on the same pad. If the subdev supports scaling but not composing, the top and left values are not used and must always be set to zero.

On source pads, cropping is similar to sink pads, with the exception that the source size from which the cropping is performed, is the COMPOSE rectangle on the sink pad. In both sink and source pads, the crop rectangle must be entirely contained inside the source image size for the crop operation.

The drivers should always use the closest possible rectangle the user requests on all selection targets, unless specifically told otherwise. V4L2_SEL_FLAG_GE and V4L2_SEL_FLAG_LE flags may be used to round the image size either up or down. *Selection flags*

**Types of selection targets**

**Actual targets**

Actual targets (without a postfix) reflect the actual hardware configuration at any point of time. There is a BOUNDS target corresponding to every actual target.
**BOUNDS targets**

BOUNDS targets is the smallest rectangle that contains all valid actual rectangles. It may not be possible to set the actual rectangle as large as the BOUNDS rectangle, however. This may be because e.g. a sensor’s pixel array is not rectangular but cross-shaped or round. The maximum size may also be smaller than the BOUNDS rectangle.

**Order of configuration and format propagation**

Inside subdevs, the order of image processing steps will always be from the sink pad towards the source pad. This is also reflected in the order in which the configuration must be performed by the user: the changes made will be propagated to any subsequent stages. If this behaviour is not desired, the user must set V4L2_SEL_FLAG_KEEP_CONFIG flag. This flag causes no propagation of the changes are allowed in any circumstances. This may also cause the accessed rectangle to be adjusted by the driver, depending on the properties of the underlying hardware.

The coordinates to a step always refer to the actual size of the previous step. The exception to this rule is the source compose rectangle, which refers to the sink compose bounds rectangle — if it is supported by the hardware.

1. Sink pad format. The user configures the sink pad format. This format defines the parameters of the image the entity receives through the pad for further processing.
2. Sink pad actual crop selection. The sink pad crop defines the crop performed to the sink pad format.
3. Sink pad actual compose selection. The size of the sink pad compose rectangle defines the scaling ratio compared to the size of the sink pad crop rectangle. The location of the compose rectangle specifies the location of the actual sink compose rectangle in the sink compose bounds rectangle.
4. Source pad actual crop selection. Crop on the source pad defines crop performed to the image in the sink compose bounds rectangle.
5. Source pad format. The source pad format defines the output pixel format of the subdev, as well as the other parameters with the exception of the image width and height. Width and height are defined by the size of the source pad actual crop selection.

Accessing any of the above rectangles not supported by the subdev will return EINVAL. Any rectangle referring to a previous unsupported rectangle coordinates will instead refer to the previous supported rectangle. For example, if sink crop is not supported, the compose selection will refer to the sink pad format dimensions instead.

In the above example, the subdev supports cropping on its sink pad. To configure it, the user sets the media bus format on the subdev’s sink pad. Now the actual crop rectangle can be set on the sink pad — the location and size of this rectangle reflect the location and size of a rectangle to be cropped from the sink format. The size of the sink crop rectangle will also be the size of the format of the subdev’s source pad.
In this example, the subdev is capable of first cropping, then scaling and finally cropping for two source pads individually from the resulting scaled image. The location of the scaled image in the cropped image is ignored in sink compose target. Both of the locations of the source crop rectangles refer to the sink scaling rectangle, independently cropping an area at location specified by the source crop rectangle from it.

The subdev driver supports two sink pads and two source pads. The images from both of the sink pads are individually cropped, then scaled and further composed on the composition bounds rectangle. From that, two independent streams are cropped and sent out of the subdev from the source pads.
Media Bus Formats

Media Bus Pixel Codes

The media bus pixel codes describe image formats as flowing over physical busses (both between separate physical components and inside SoC devices). This should not be confused with the V4L2 pixel formats that describe, using four character codes, image formats as stored in memory.

While there is a relationship between image formats on busses and image formats in memory (a raw Bayer image won’t be magically converted to JPEG just by storing it to memory), there is no one-to-one correspondance between them.

Packed RGB Formats

Those formats transfer pixel data as red, green and blue components. The format code is made of the following information.

- The red, green and blue components order code, as encoded in a pixel sample. Possible values are RGB and BGR.
- The number of bits per component, for each component. The values can be different for all components. Common values are 555 and 565.
- The number of bus samples per pixel. Pixels that are wider than the bus width must be transferred in multiple samples. Common values are 1 and 2.
- The bus width.
- For formats where the total number of bits per pixel is smaller than the number of bus samples per pixel times the bus width, a padding value stating if the bytes are padded in their most high order bits (PADHI) or low order bits (PADLO). A “C” prefix is used for component-wise padding in the most high order bits (CPADHI) or low order bits (CPADLO) of each separate component.
For formats where the number of bus samples per pixel is larger than 1, an endianness value stating if the pixel is transferred MSB first (BE) or LSB first (LE).

For instance, a format where pixels are encoded as 5-bits red, 5-bits green and 5-bit blue values padded on the high bit, transferred as 2 8-bit samples per pixel with the most significant bits (padding, red and half of the green value) transferred first will be named MEDIA_BUS_FMT_RGB555_2X8_PADHI_BE.

The following table lists existing packed RGB formats.

</tbody>
</table>

On LVDS buses, usually each sample is transferred serialized in seven time slots per pixel clock, on three (18-bit) or four (24-bit) differential data pairs at the same time. The remaining bits are used for control signals as defined by SPWG/PSWG/VEISA or JEIDA standards. The 24-bit RGB format serialized in seven time slots on four lanes using JEIDA defined bit mapping will be named MEDIA_BUS_FMT_RGB888_1X7X4_JEIDA, for example.

Bayer Formats

Those formats transfer pixel data as red, green and blue components. The format code is made of the following information.

- The red, green and blue components order code, as encoded in a pixel sample. The possible values are shown in Figure 4.8 Bayer Patterns.
- The number of bits per pixel component. All components are transferred on the same number of bits. Common values are 8, 10 and 12.
- The compression (optional). If the pixel components are ALAW- or DPCM-compressed, a mention of the compression scheme and the number of bits per compressed pixel component.
- The number of bus samples per pixel. Pixels that are wider than the bus width must be transferred in multiple samples. Common values are 1 and 2.
- The bus width.
- For formats where the total number of bits per pixel is smaller than the number of bus samples per pixel times the bus width, a padding value stating if the bytes are padded in their most high order bits (PADHI) or low order bits (PADLO).
- For formats where the number of bus samples per pixel is larger than 1, an endianness value stating if the pixel is transferred MSB first (BE) or LSB first (LE).
For instance, a format with uncompressed 10-bit Bayer components arranged in a red, green, green, blue pattern transferred as 2 8-bit samples per pixel with the least significant bits transferred first will be named `MEDIA_BUS_FMT_SRGGB10_2X8_PADHI_LE`.

The following table lists existing packed Bayer formats. The data organization is given as an example for the first pixel only.

---

**Fig. 1.13: Figure 4.8 Bayer Patterns**

The following table lists existing packed Bayer formats. The data organization is given as an example for the first pixel only.
The format code is made of the following information.

Those data formats transfer pixel data as (possibly downsampled) Y, U and V components. Some formats include dummy bits in some of their samples and are collectively referred to as “YDYC” (Y-Dummy-Y-Chroma) formats. One cannot rely on the values of these dummy bits as those are undefined.

The format code is made of the following information.

- The Y, U and V components order code, as transferred on the bus. Possible values are YUYV, UYVY, VVYU and VYUY for formats with no dummy bit, and YDYUUYDYV, YDYVYDYU, YUYDYVYD and YVYDYUYD for YDYC formats.
- The number of bits per pixel component. All components are transferred on the same number of bits. Common values are 8, 10 and 12.

**Packed YUV Formats**

Those data formats transfer pixel data as (possibly downsampled) Y, U and V components. Some formats include dummy bits in some of their samples and are collectively referred to as “YDYC” (Y-Dummy-Y-Chroma) formats. One cannot rely on the values of these dummy bits as those are undefined.

The format code is made of the following information.

- The Y, U and V components order code, as transferred on the bus. Possible values are YUYV, UYVY, VVYU and VYUY for formats with no dummy bit, and YDYUUYDYV, YDYVYDYU, YUYDYVYD and YVYDYUYD for YDYC formats.
- The number of bits per pixel component. All components are transferred on the same number of bits. Common values are 8, 10 and 12.
The role of each bit transferred over the bus is identified by one of the following codes. The number of bus samples per pixel. Pixels that are wider than the bus width must be transferred in multiple samples. Common values are 1, 1.5 (encoded as 1_5) and 2.

- The bus width. When the bus width is larger than the number of bits per pixel component, several components are packed in a single bus sample. The components are ordered as specified by the order code, with components on the left of the code transferred in the high order bits. Common values are 8 and 16.

For instance, a format where pixels are encoded as 8-bit YUV values downscaled to 4:2:2 and transferred as 2 8-bit bus samples per pixel in the U, Y, V, Y order will be named MEDIA_BUS_FMT_UYVY8_2X8.

v4l2-mbus-pixelcode-yuv8 lists existing packed YUV formats and describes the organization of each pixel data in each sample. When a format pattern is split across multiple samples each of the samples in the pattern is described.

The role of each bit transferred over the bus is identified by one of the following codes.

- y_x for luma component bit number x
- u_x for blue chroma component bit number x
- v_x for red chroma component bit number x
- a_x for alpha component bit number x
- for non-available bits (for positions higher than the bus width)
- d for dummy bits

</table>

HSV/HSL Formats

Those formats transfer pixel data as RGB values in a cylindrical-coordinate system using Hue-Saturation-Value or Hue-Saturation-Lightness components. The format code is made of the following information.

- The hue, saturation, value or lightness and optional alpha components order code, as encoded in a pixel sample. The only currently supported value is AHSV.
- The number of bits per component, for each component. The values can be different for all components. The only currently supported value is 8888.
The number of bus samples per pixel. Pixels that are wider than the bus width must be transferred in multiple samples. The only currently supported value is 1.

The bus width.

For formats where the total number of bits per pixel is smaller than the number of bus samples per pixel times the bus width, a padding value stating if the bytes are padded in their most high order bits (PADHI) or low order bits (PADLO).

For formats where the number of bus samples per pixel is larger than 1, an endianness value stating if the pixel is transferred MSB first (BE) or LSB first (LE).

The following table lists existing HSV/HSL formats.

### Table 1.41: HSV/HSL formats

</tr>
</tbody>
</table>

**JPEG Compressed Formats**

Those data formats consist of an ordered sequence of 8-bit bytes obtained from JPEG compression process. Additionally to the _JPEG_ postfix the format code is made of the following information.

- The number of bus samples per entropy encoded byte.
- The bus width.

For instance, for a JPEG baseline process and an 8-bit bus width the format will be named MEDIA_BUS_FMT_JPEG_1X8.

The following table lists existing JPEG compressed formats.

### 1.2.5 V4L2 Driver Programming

to do
1.2.6 Libv4l Userspace Library

Introduction

libv4l is a collection of libraries which adds a thin abstraction layer on top of video4linux2 devices. The purpose of this (thin) layer is to make it easy for application writers to support a wide variety of devices without having to write separate code for different devices in the same class.

An example of using libv4l is provided by v4l2grab.

libv4l consists of 3 different libraries:

libv4lconvert

libv4lconvert is a library that converts several different pixelformats found in V4L2 drivers into a few common RGB and YUY formats.

Later on libv4lconvert was expanded to also be able to do various video processing functions to improve webcam video quality. The video processing is split into 2 parts: libv4lconvert/control and libv4lconvert/processing.

The control part is used to offer video controls which can be used to control the video processing functions made available by libv4lconvert/processing. These controls are stored application wide (until reboot) by using a persistent shared memory object.

libv4lconvert/processing offers the actual video processing functionality.

libv4l1

This library offers functions that can be used to quickly make v4l1 applications work with v4l2 devices. These functions work exactly like the normal open/close/etc, except that libv4l1 does full emulation of the v4l1 api on top of v4l2 drivers, in case of v4l1 drivers it will just pass calls through.

Since those functions are emulations of the old V4L1 API, it shouldn’t be used for new applications.

libv4l2

This library should be used for all modern V4L2 applications.

It provides handles to call V4L2 open/ioctl/close/poll methods. Instead of just providing the raw output of the device, it enhances the calls in the sense that it will use libv4lconvert to provide more video formats and to enhance the image quality.

In most cases, libv4l2 just passes the calls directly through to the v4l2 driver, intercepting the calls to VIDIOC_TRY_FMT, VIDIOC_G_FMT, VIDIOC_S_FMT, VIDIOC_ENUM_FRAMESIZES and VIDIOC_ENUM_FRAMEINTERVALS in order to emulate the formats V4L2_PIX_FMT_BGR24, V4L2_PIX_FMT_RGB24, V4L2_PIX_FMT_YUV420, and V4L2_PIX_FMT_YUV420, if they aren’t available in the driver. VIDIOC_ENUM_FMT keeps enumerating the hardware supported formats, plus the emulated formats offered by libv4l at the end.
Libv4l device control functions

The common file operation methods are provided by libv4l.

Those functions operate just like glibc open/close/dup/ioctl/read/mmap/munmap:

- \texttt{int v4l2\_open(const char *file, int oflag, ...)} - operates like the standard \texttt{open()} function.
- \texttt{int v4l2\_close(int fd)} - operates like the standard \texttt{close()} function.
- \texttt{int v4l2\_dup(int fd)} - operates like the standard \texttt{dup()} function, duplicating a file handler.
- \texttt{int v4l2\_ioctl (int fd, unsigned long int request, ...)} - operates like the standard \texttt{ioctl()} function.
- \texttt{int v4l2\_read (int fd, void* buffer, size_t n)} - operates like the standard \texttt{read()} function.
- \texttt{void v4l2\_mmap(void *start, size_t length, int prot, int flags, int fd, int64_t offset);} - operates like the standard \texttt{mmap()} function.
- \texttt{int v4l2\_munmap(void *start, size_t length)}; - operates like the standard \texttt{munmap()} function.

Those functions provide additional control:

- \texttt{int v4l2\_fd\_open(int fd, int v4l2\_flags)} - opens an already opened fd for further use through v4l2lib and possibly modify libv4l2’s default behavior through the v4l2\_flags argument. Currently, v4l2\_flags can be \texttt{V4L2\_DISABLE\_CONVERSION}, to disable format conversion.
- \texttt{int v4l2\_set\_control(int fd, int cid, int value)} - This function takes a value of 0 - 65535, and then scales that range to the actual range of the given v4l control id, and then if the cid exists and is not locked sets the cid to the scaled value.
- \texttt{int v4l2\_get\_control(int fd, int cid)} - This function returns a value of 0 - 65535, scaled to from the actual range of the given v4l control id. when the cid does not exist, could not be accessed for some reason, or some error occurred 0 is returned.

v4l1compat.so wrapper library

This library intercepts calls to open/close/ioctl/mmap/mmunmap operations and redirects them to the libv4l counterparts, by using \texttt{LD\_PRELOAD=/usr/lib/v4l1compat.so}. It also emulates V4L1 calls via V4L2 API.

It allows usage of binary legacy applications that still don’t use libv4l.

1.2.7 Changes

The following chapters document the evolution of the V4L2 API, errata or extensions. They are also intended to help application and driver writers to port or update their code.

Differences between V4L and V4L2

The Video For Linux API was first introduced in Linux 2.1 to unify and replace various TV and radio device related interfaces, developed independently by driver writers in prior years. Starting with Linux 2.5 the much improved V4L2 API replaces the V4L API. The support for the old V4L calls were removed from Kernel, but the library \textit{Libv4l Userspace Library} supports the conversion of a V4L API system call into a V4L2 one.
Opening and Closing Devices

For compatibility reasons the character device file names recommended for V4L2 video capture, overlay, radio and raw vbi capture devices did not change from those used by V4L. They are listed in Interfaces and below in V4L Device Types, Names and Numbers.

The teletext devices (minor range 192-223) have been removed in V4L2 and no longer exist. There is no hardware available anymore for handling pure teletext. Instead raw or sliced VBI is used.

The V4L videodev module automatically assigns minor numbers to drivers in load order, depending on the registered device type. We recommend that V4L2 drivers by default register devices with the same numbers, but the system administrator can assign arbitrary minor numbers using driver module options. The major device number remains 81.

<table>
<thead>
<tr>
<th>Device Type</th>
<th>File Name</th>
<th>Minor Numbers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Video capture and overlay</td>
<td>/dev/video and /dev/bttv0¹, /dev/video0 to /dev/video63</td>
<td>0-63</td>
</tr>
<tr>
<td>Radio receiver</td>
<td>/dev/radio², /dev/radio0 to /dev/radio63</td>
<td>64-127</td>
</tr>
<tr>
<td>Raw VBI capture</td>
<td>/dev/vbi, /dev/vbi0 to /dev/vbi31</td>
<td>224-255</td>
</tr>
</tbody>
</table>

V4L prohibits (or used to prohibit) multiple opens of a device file. V4L2 drivers may support multiple opens, see Opening and Closing Devices for details and consequences.

V4L drivers respond to V4L2 ioctl with an EINVAL error code.

Querying Capabilities

The V4L VIDIOCGETCAP ioctl is equivalent to V4L2’s ioctl VIDIOC_QUERYCAP.

The name field in struct struct video_capability became card in struct v4l2_capability, type was replaced by capabilities. Note V4L2 does not distinguish between device types like this, better think of basic video input, video output and radio devices supporting a set of related functions like video capturing, video overlay and VBI capturing. See Opening and Closing Devices for an introduction.

```
struct video_capability

struct v4l2_capability capabilitiesflags

VID_TYPE_CAPTURE V4L2_CAP_VIDEO_CAPTURE The video capture interface is supported.
VID_TYPE_TUNER V4L2_CAP_TUNER The device has a tuner or modulator.
VID_TYPE_TELETEXT V4L2_CAP_VBI_CAPTURE The raw VBI capture interface is supported.
VID_TYPE_OVERLAY V4L2_CAP_VIDEO_OVERLAY The video overlay interface is supported.
VID_TYPE_CHROMAKEY V4L2_FBUF_CAP_CHROMAKEY in field capability of struct v4l2_framebuffer Whether chromakey overlay is supported. For more information on overlay see Video Overlay Interface.
```

¹ According to Documentation/devices.txt these should be symbolic links to /dev/video0. Note the original bttv interface is not compatible with V4L or V4L2.

² According to Documentation/devices.txt a symbolic link to /dev/radio0.
### Table 1.45 – continued from previous page

<table>
<thead>
<tr>
<th>Structure</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VID_TYPE_CLIPPING</strong></td>
<td>Whether clipping the overlaid image is supported, see <a href="#">Video Overlay Interface</a>.</td>
</tr>
<tr>
<td><strong>VID_TYPE_FRAMERAM</strong></td>
<td>Whether overlay overwrites frame buffer memory, see <a href="#">Video Overlay Interface</a>.</td>
</tr>
<tr>
<td><strong>VID_TYPE_SCALES</strong></td>
<td>This flag indicates if the hardware can scale images. The V4L2 API implies the scale factor by setting the cropping dimensions and image size with the <code>VIDIOC_S_CROP</code> and <code>VIDIOC_S_FMT</code> ioctl, respectively. The driver returns the closest sizes possible. For more information on cropping and scaling see <a href="#">Image Cropping, Insertion and Scaling</a>.</td>
</tr>
<tr>
<td><strong>VID_TYPE_MONOCHROME</strong></td>
<td>Applications can enumerate the supported image formats with the ioctl <code>VIDIOC_ENUM_FMT</code> ioctl to determine if the device supports grey scale capturing only. For more information on image formats see <a href="#">Image Formats</a>.</td>
</tr>
<tr>
<td><strong>VID_TYPE_SUBCAPTURE</strong></td>
<td>Applications can call the <code>VIDIOC_G_CROP</code> ioctl to determine if the device supports capturing a subsection of the full picture (“cropping” in V4L2). If not, the ioctl returns the EINVAL error code. For more information on cropping and scaling see <a href="#">Image Cropping, Insertion and Scaling</a>.</td>
</tr>
<tr>
<td><strong>VID_TYPE_MPEG_DECODER</strong></td>
<td>Applications can enumerate the supported image formats with the ioctl <code>VIDIOC_ENUM_FMT</code> ioctl to determine if the device supports MPEG streams.</td>
</tr>
<tr>
<td><strong>VID_TYPE_MPEG_ENCODER</strong></td>
<td>See above.</td>
</tr>
<tr>
<td><strong>VID_TYPE_MJPEG_DECODER</strong></td>
<td>See above.</td>
</tr>
<tr>
<td><strong>VID_TYPE_MJPEG_ENCODER</strong></td>
<td>See above.</td>
</tr>
</tbody>
</table>

The `audios` field was replaced by capabilities flag `V4L2_CAP_AUDIO`, indicating if the device has any audio inputs or outputs. To determine their number applications can enumerate audio inputs with the `VIDIOC_G_AUDIO` ioctl. The audio ioctls are described in [Audio Inputs and Outputs](#).

The `maxwidth`, `maxheight`, `minwidth` and `minheight` fields were removed. Calling the `VIDIOC_S_FMT` or `VIDIOC_TRY_FMT` ioctl with the desired dimensions returns the closest size possible, taking into account the current video standard, cropping and scaling limitations.

1.2. Part I - Video for Linux API 161
Video Sources

V4L provides the VIDIOC.GCHAN and VIDIOC.SCHAN ioctl using struct video_channel to enumerate the video inputs of a V4L device. The equivalent V4L2 ioctls are ioctl VIDIOC_ENUMINPUT, VIDIOC_G_INPUT and VIDIOC_S_INPUT using struct v4l2_input as discussed in Video Inputs and Outputs.

The channel field counting inputs was renamed to index, the video input types were renamed as follows:

<table>
<thead>
<tr>
<th>video_channel type</th>
<th>v4l2_input type</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIDEO_TYPE_TV</td>
<td>V4L_INPUT_TYPE_TUNER</td>
</tr>
<tr>
<td>VIDEO_TYPE_CAMERA</td>
<td>V4L_INPUT_TYPE_CAMERA</td>
</tr>
</tbody>
</table>

Unlike the tuners field expressing the number of tuners of this input, V4L2 assumes each video input is connected to at most one tuner. However a tuner can have more than one input, i.e. RF connectors, and a device can have multiple tuners. The index number of the tuner associated with the input, if any, is stored in field tuner of struct v4l2_input. Enumeration of tuners is discussed in Tuners and Modulators.

The redundant VIDEO_VC_TUNER flag was dropped. Video inputs associated with a tuner are of type V4L2_INPUT_TYPE_TUNER. The VIDEO_VC_AUDIO flag was replaced by the audioset field. V4L2 considers devices with up to 32 audio inputs. Each set bit in the audioset field represents one audio input this video input combines with. For information about audio inputs and how to switch between them see Audio Inputs and Outputs.

The norm field describing the supported video standards was replaced by std. The V4L specification mentions a flag VIDEO_VC_NORM indicating whether the standard can be changed. This flag was a later addition together with the norm field and has been removed in the meantime. V4L2 has a similar, albeit more comprehensive approach to video standards, see Video Standards for more information.

Tuning

The V4L VIDIOC.GTUNER and VIDIOC.STUNER ioctl and struct video_tuner can be used to enumerate the tuners of a V4L TV or radio device. The equivalent V4L2 ioctls are VIDIOC.G_TUNER and VIDIOC.S_TUNER using struct v4l2_tuner. Tuners are covered in Tuners and Modulators.

The tuner field counting tuners was renamed to index. The fields name, rangelow and rangehigh remained unchanged.

The VIDEO.TUNER.PAL, VIDEO.TUNER.NTSC and VIDEO.TUNER.SECAM flags indicating the supported video standards were dropped. This information is now contained in the associated struct v4l2_input. No replacement exists for the VIDEO.TUNER.NORM flag indicating whether the video standard can be switched. The mode field to select a different video standard was replaced by a whole new set of ioctls and structures described in Video Standards. Due to its ubiquity it should be mentioned the BTTV driver supports several standards in addition to the regular VIDEO_MODE_PAL (0), VIDEO_MODE_NTSC, VIDEO_MODE_SECAM and VIDEO_MODE.AUTO (3). Namely N/PAL Argentina, M/PAL, N/PAL, and NTSC Japan with numbers 3-6 (sic).

The VIDEO.TUNER.STEREO_ON flag indicating stereo reception became V4L2.TUNER.SUB_STEREO in field rxsubchans. This field also permits the detection of monaural and bilingual audio, see the definition of struct v4l2_tuner for details. Presently no replacement exists for the VIDEO.TUNER.RDS_ON and VIDEO.TUNER.MBS_ON flags.

The VIDEO.TUNER_LOW flag was renamed to V4L2.TUNER.CAP_LOW in the struct v4l2_tuner capability field.

The VIDIOC.GFREQ and VIDIOC.SFREQ ioctl to change the tuner frequency where renamed to VIDIOC.G_FREQUENCY and VIDIOC.S_FREQUENCY. They take a pointer to a struct v4l2_frequency instead of an unsigned long integer.
Image Properties

V4L2 has no equivalent of the VIDIOCGETPICT and VIDIOCSETPICT ioctl and struct struct video_picture. The following fields where replaced by V4L2 controls accessible with the ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU, VIDIOC_G_CTRL and VIDIOC_S_CTRL:

<table>
<thead>
<tr>
<th>struct struct video_picture</th>
<th>V4L2 Control ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>brightness</td>
<td>V4L2_CID_BRIGHTNESS</td>
</tr>
<tr>
<td>hue</td>
<td>V4L2_CID_HUE</td>
</tr>
<tr>
<td>colour</td>
<td>V4L2_CID_SATURATION</td>
</tr>
<tr>
<td>contrast</td>
<td>V4L2_CID_CONTRAST</td>
</tr>
<tr>
<td>whiteness</td>
<td>V4L2_CID_WHITENESS</td>
</tr>
</tbody>
</table>

The V4L picture controls are assumed to range from 0 to 65535 with no particular reset value. The V4L2 API permits arbitrary limits and defaults which can be queried with the ioctl VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU ioctl. For general information about controls see User Controls.

The depth (average number of bits per pixel) of a video image is implied by the selected image format. V4L2 does not explicitly provide such information assuming applications recognizing the format are aware of the image depth and others need not know. The palette field moved into the struct v4l2_pix_format:

<table>
<thead>
<tr>
<th>struct struct video_picture palette</th>
<th>struct v4l2_pix_format pixfmt</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIDEO_PALETTE_GREY</td>
<td>V4L2_PIX_FMT_GREY</td>
</tr>
<tr>
<td>VIDEO_PALETTE_HI240</td>
<td>V4L2_PIX_FMT_HI240</td>
</tr>
<tr>
<td>VIDEO_PALETTE_RGB565</td>
<td>V4L2_PIX_FMT_RGB565</td>
</tr>
<tr>
<td>VIDEO_PALETTE_RGB555</td>
<td>V4L2_PIX_FMT_RGB555</td>
</tr>
<tr>
<td>VIDEO_PALETTE_RGB24</td>
<td>V4L2_PIX_FMT_BGR24</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV422</td>
<td>V4L2_PIX_FMT_YUV422</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV422P</td>
<td>V4L2_PIX_FMT_YUV422P</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV411</td>
<td>V4L2_PIX_FMT_YUV411P</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV410P</td>
<td>V4L2_PIX_FMT_YUV410P</td>
</tr>
<tr>
<td>VIDEO_PALETTE_YUV401P</td>
<td>V4L2_PIX_FMT_YUV401P</td>
</tr>
</tbody>
</table>

V4L2 image formats are defined in Image Formats. The image format can be selected with the VIDIOC_S_FMT ioctl.

Audio

The VIDIOCGAUDIO and VIDIOCSETAUDIO ioctl and struct struct video_audio are used to enumerate the audio inputs of a V4L device. The equivalent V4L2 ioctls are VIDIOC_G_AUDIO and VIDIOC_S_AUDIO using struct v4l2_audio as discussed in Audio Inputs and Outputs.

The audio “channel number” field counting audio inputs was renamed to index.

---

3 This is a custom format used by the BTTV driver, not one of the V4L2 standard formats.
4 Presumably all V4L RGB formats are little-endian, although some drivers might interpret them according to machine endianness. V4L2 defines little-endian, big-endian and red/blue swapped variants. For details see RGB Formats.
5 VIDEO_PALETTE_YUV422 and VIDEO_PALETTE_YUVY are the same formats. Some V4L drivers respond to one, some to the other.
6 Not to be confused with V4L2_PIX_FMT_YUV411P, which is a planar format.
7 V4L explains this as: “RAW capture (BT848)”
8 Not to be confused with V4L2_PIX_FMT_YUV41P, which is a packed format.
On VIDIOCSAUDIO the mode field selects one of the VIDEO_SOUND_MONO, VIDEO_SOUND_STEREO, VIDEO_SOUND_LANG1 or VIDEO_SOUND_LANG2 audio demodulation modes. When the current audio standard is BTSC VIDEO_SOUND_LANG2 refers to SAP and VIDEO_SOUND_LANG1 is meaningless. Also undocumented in the V4L specification, there is no way to query the selected mode. On VIDIOCGAUDIO the driver returns the actually received audio programmes in this field. In the V4L2 API this information is stored in the struct v4l2_tuner rxsubchans and audmode fields, respectively. See Tuners and Modulators for more information on tuners. Related to audio modes struct v4l2_audio also reports if this is a mono or stereo input, regardless if the source is a tuner.

The following fields where replaced by V4L2 controls accessible with the ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU, VIDIOC_G_CTRL and VIDIOC_S_CTRL ioctls:

<table>
<thead>
<tr>
<th>struct video_audio field</th>
<th>V4L2 Control ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>volume</td>
<td>V4L2_CID_AUDIO_VOLUME</td>
</tr>
<tr>
<td>bass</td>
<td>V4L2_CID_AUDIO_BASS</td>
</tr>
<tr>
<td>treble</td>
<td>V4L2_CID_AUDIO_TREBLE</td>
</tr>
<tr>
<td>balance</td>
<td>V4L2_CID_AUDIO_BALANCE</td>
</tr>
</tbody>
</table>

To determine which of these controls are supported by a driver V4L provides the flags VIDEO_AUDIO_VOLUME, VIDEO_AUDIO_BASS, VIDEO_AUDIO_TREBLE and VIDEO_AUDIO_BALANCE. In the V4L2 API the ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU ioctl reports if the respective control is supported. Accordingly the VIDEO_AUDIO_MUTABLE and VIDEO_AUDIO_MUTE flags where replaced by the boolean V4L2_CID_AUDIO_MUTE control.

All V4L2 controls have a step attribute replacing the struct video_audio step field. The V4L audio controls are assumed to range from 0 to 65535 with no particular reset value. The V4L2 API permits arbitrary limits and defaults which can be queried with the ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU ioctl. For general information about controls see User Controls.

Frame Buffer Overlay

The V4L2 ioctls equivalent to VIDIOCGFBUF and VIDIOCSFBUF are VIDIOC_G_FBUF and VIDIOC_S_FBUF. The base field of struct video_buffer remained unchanged, except V4L2 defines a flag to indicate non-destructive overlays instead of a NULL pointer. All other fields moved into the struct v4l2_pix_format fmt substructure of struct v4l2_framebuffer. The depth field was replaced by pixelformat. See RGB Formats for a list of RGB formats and their respective color depths.

Instead of the special ioctls VIDIOCGWIN and VIDIOCSWIN V4L2 uses the general-purpose data format negotiation ioctls VIDIOC_G_FMT and VIDIOC_S_FMT. They take a pointer to a struct v4l2_format as argument. Here the win member of the fmt union is used, a struct v4l2_window. The x, y, width and height fields of struct video_window moved into struct v4l2_rect substructure of struct v4l2_window. The chromakey, clips, and clipcount fields remained unchanged. Struct struct video_clip was renamed to struct v4l2_clip, also containing a struct struct v4l2_rect, but the semantics are still the same.

The VIDEO_WINDOW_INTERLACE flag was dropped. Instead applications must set the field field to V4L2_FIELD_ANY or V4L2_FIELD_INTERLACED. The VIDEO_WINDOW_CHROMAKEY flag moved into struct v4l2_framebuffer, under the new name V4L2_FBUF_FLAG_CHROMAKEY.

In V4L, storing a bitmap pointer in clips and setting clipcount to VIDEO_CLIP_BITMAP (-1) requests bitmap clipping, using a fixed size bitmap of 1024 × 625 bits. Struct struct v4l2_window has a separate bitmap pointer field for this purpose and the bitmap size is determined by w.width and w.height.

The VIDIOCCAPTURE ioctl to enable or disable overlay was renamed to ioctl VIDIOC_OVERLAY.
Cropping

To capture only a subsection of the full picture V4L defines the VIDEIOC_GCAPTURE and VIDEIOC_SCAPTURE ioctlts using struct video_capture. The equivalent V4L2 ioctlts are VIDIOC_G_CROP and VIDIOC_S_CROP using struct v4l2_crop, and the related ioctl VIDIOC_CROPCAP ioctl. This is a rather complex matter, see Image Cropping, Insertion and Scaling for details.

The x, y, width and height fields moved into struct v4l2_rect substructure c of struct v4l2_crop. The decimation field was dropped. In the V4L2 API the scaling factor is implied by the size of the cropping rectangle and the size of the captured or overlaid image.

The VIDEO_CAPTURE_ODD and VIDEO_CAPTURE_EVEN flags to capture only the odd or even field, respectively, were replaced by V4L2_FIELD_TOP and V4L2_FIELD_BOTTOM in the field named field of struct v4l2_pix_format and struct v4l2_window. These structures are used to select a capture or overlay format with the VIDIOC_S_FMT ioctl.

Reading Images, Memory Mapping

Capturing using the read method

There is no essential difference between reading images from a V4L or V4L2 device using the read() function, however V4L2 drivers are not required to support this I/O method. Applications can determine if the function is available with the ioctl VIDIOC_QUERYCAP ioctl. All V4L2 devices exchanging data with applications must support the select() and poll() functions.

To select an image format and size, V4L provides the VIDIOCSPICT and VIDIOCSWIN ioctlts. V4L2 uses the general-purpose data format negotiation ioctlts VIDIOC_G_FMT and VIDIOC_S_FMT. They take a pointer to a struct v4l2_format as argument, here the struct v4l2_pix_format named pix of its fmt union is used.

For more information about the V4L2 read interface see Read/Write.

Capturing using memory mapping

Applications can read from V4L devices by mapping buffers in device memory, or more often just buffers allocated in DMA-able system memory, into their address space. This avoids the data copying overhead of the read method. V4L2 supports memory mapping as well, with a few differences.
### V4L vs V4L2

<table>
<thead>
<tr>
<th>V4L</th>
<th>V4L2</th>
</tr>
</thead>
<tbody>
<tr>
<td>The image format must be selected before buffers are allocated, with the <code>VIDIOC_S_FMT</code> ioctl. When no format is selected the driver may use the last, possibly by another application requested format.</td>
<td>The <code>ioctl VIDIOC_REQBUFS</code> ioctl allocates the desired number of buffers, this is a required step in the initialization sequence.</td>
</tr>
<tr>
<td>Applications cannot change the number of buffers. The it is built into the driver, unless it has a module option to change the number when the driver module is loaded.</td>
<td>Buffers are individually mapped. The offset and size of each buffer can be determined with the <code>ioctl VIDIOC_QUERYBUF</code> ioctl.</td>
</tr>
<tr>
<td>Drivers map all buffers as one contiguous range of memory. The VIDIOCGMBUF ioctl is available to query the number of buffers, the offset of each buffer from the start of the virtual file, and the overall amount of memory used, which can be used as arguments for the <code>mmap()</code> function.</td>
<td>Drivers maintain an incoming and outgoing queue. <code>ioctl VIDIOC_QBUF, VIDIOC_DQBUF</code> enqueues any empty buffer into the incoming queue. Filled buffers are dequeued from the outgoing queue with the <code>VIDIOC_DQBUF</code> ioctl. To wait until filled buffers become available this function, <code>select()</code> or <code>poll()</code> can be used. The <code>ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF</code> ioctl must be called once after enqueuing one or more buffers to start capturing. Its counterpart <code>VIDIOC_STREAMOFF</code> stops capturing and dequeues all buffers from both queues. Applications can query the signal status, if known, with the <code>ioctl VIDIOC_ENUMINPUT</code> ioctl.</td>
</tr>
<tr>
<td>The <code>VIDIOC_MCAPTURE</code> ioctl prepares a buffer for capturing. It also determines the image format for this buffer. The ioctl returns immediately, eventually with an EAGAIN error code if no video signal had been detected. When the driver supports more than one buffer applications can call the ioctl multiple times and thus have multiple outstanding capture requests. The <code>VIDIOC_SYNC</code> ioctl suspends execution until a particular buffer has been filled.</td>
<td>For a more in-depth discussion of memory mapping and examples, see <a href="#">Streaming I/O (Memory Mapping)</a>.</td>
</tr>
</tbody>
</table>

#### Reading Raw VBI Data

Originally the V4L API did not specify a raw VBI capture interface, only the device file `/dev/vbi` was reserved for this purpose. The only driver supporting this interface was the BTTV driver, de-facto defining the V4L VBI interface. Reading from the device yields a raw VBI image with the following parameters:

```c
struct v4l2_vbi_format V4L, BTTV driver
sampling_rate 28636363 Hz NTSC (or any other 525-line standard); 35468950 Hz PAL and SECAM (625-line standards)
offset ?
samples_per_line 2048
sample_format V4L2_PIX_FMT_GREY. The last four bytes (a machine endianness integer) contain a frame counter.
start[10, 273 NTSC; 22, 335 PAL and SECAM
count[16, 16
flags 0
```

Undocumented in the V4L specification, in Linux 2.3 the VIDIOCGVBIIFMT and VIDIOCCSVBIIFMT ioctls using `struct vbi_format` were added to determine the VBI image parameters. These ioctls are only partially compatible with the V4L2 VBI interface specified in [Raw VBI Data Interface](#).

An offset field does not exist, `sample_format` is supposed to be `VIDEO_PALETTE_RAW`, equivalent to `V4L2_PIX_FMT_GREY`. The remaining fields are probably equivalent to `struct v4l2_vbi_format`.

---

9. Old driver versions used different values, eventually the custom BTTV_VBISIZE ioctl was added to query the correct values.
Apparently only the Zoran (ZR 36120) driver implements these ioctls. The semantics differ from those specified for V4L2 in two ways. The parameters are reset on `open()` and VIDIOCSETVBIFMT always returns an EINVAL error code if the parameters are invalid.

**Miscellaneous**

V4L2 has no equivalent of the VIDIOCGETUNIT ioctl. Applications can find the VBI device associated with a video capture device (or vice versa) by reopening the device and requesting VBI data. For details see *Opening and Closing Devices*.

No replacement exists for VIDIOCKEY, and the V4L functions for microcode programming. A new interface for MPEG compression and playback devices is documented in *Extended Controls*.

**Changes of the V4L2 API**

Soon after the V4L API was added to the kernel it was criticised as too inflexible. In August 1998 Bill Dirks proposed a number of improvements and began to work on documentation, example drivers and applications. With the help of other volunteers this eventually became the V4L2 API, not just an extension but a replacement for the V4L API. However it took another four years and two stable kernel releases until the new API was finally accepted for inclusion into the kernel in its present form.

**Early Versions**

1998-08-20: First version.
1998-08-27: The `select()` function was introduced.
1998-09-18: The VIDIOC_NONCAP ioctl was replaced by the otherwise meaningless 0_TRUNC `open()` flag, and the aliases 0_NONCAP and 0_NOIO were defined. Applications can set this flag if they intend to access controls only, as opposed to capture applications which need exclusive access. The VIDEO_STD_XXX identifiers are now ordinals instead of flags, and the video_std_construct() helper function takes id and transmission arguments.
1998-10-02: The id field was removed from struct struct video_standard and the color subcarrier fields were renamed. The ioctl VIDIOC_QUERYSTD ioctl was renamed to ioctl VIDIOC_ENUMSTD, VIDIOC_G_INPUT to ioctl VIDIOC_ENUMINPUT. A first draft of the Codec API was released.
1998-11-08: Many minor changes. Most symbols have been renamed. Some material changes to struct v4l2_capability.
1998-11-12: The read/write direction of some ioctls was misdefined.
1998-11-14: V4L2_PIX_FMT_RGB24 changed to V4L2_PIX_FMT_BGR24, and V4L2_PIX_FMT_RGB32 changed to V4L2_PIX_FMT_BGR32. Audio controls are now accessible with the VIDIOC_G_CTRL and VIDIOC_S_CTRL ioctls under names starting with V4L2_CID_AUDIO. The V4L2_MAJOR define was removed from videodev.h since it was only used once in the videodev kernel module. The YUV422 and YUV411 planar image formats were added.
1998-11-28: A few ioctl symbols changed. Interfaces for codecs and video output devices were added.
1999-01-14: A raw VBI capture interface was added.
1999-01-19: The VIDIOC_NEXTBUF ioctl was removed.
V4L2 Version 0.16 1999-01-31

1999-01-27: There is now one QBUF ioctl, VIDIOC_QWBUF and VIDIOC_QRBUF are gone. VIDIOC_QBUF takes a v4l2_buffer as a parameter. Added digital zoom (cropping) controls.

V4L2 Version 0.18 1999-03-16

Added a v4l to V4L2 ioctl compatibility layer to videodev.c. Driver writers, this changes how you implement your ioctl handler. See the Driver Writer’s Guide. Added some more control id codes.

V4L2 Version 0.19 1999-06-05

1999-03-18: Fill in the category and catname fields of v4l2_queryctrl objects before passing them to the driver. Required a minor change to the V4L2_QUERYCTRL handlers in the sample drivers.

1999-03-31: Better compatibility for v4l memory capture ioctls. Requires changes to drivers to fully support new compatibility features, see Driver Writer’s Guide and v4l2cap.c. Added new control IDs: V4L2_CID_HFLIP, _VFLIP. Changed V4L2_PIX_FMT_YUV422P to _YUV422P, and _YUV411P to _YUV411P.

1999-04-04: Added a few more control IDs.

1999-04-07: Added the button control type.

1999-05-02: Fixed a typo in videodev.h, and added the V4L2_CTRL_FLAG_GRAYED (later V4L2_CTRL_FLAG_GRABBED) flag.

1999-05-20: Definition of VIDIOC_G_CTRL was wrong causing a malfunction of this ioctl.

1999-06-05: Changed the value of V4L2_CID_WHITENESS.

V4L2 Version 0.20 (1999-09-10)

Version 0.20 introduced a number of changes which were not backward compatible with 0.19 and earlier versions. Purpose of these changes was to simplify the API, while making it more extensible and following common Linux driver API conventions.

1. Some typos in V4L2_FMT_FLAG symbols were fixed. struct v4l2_clip was changed for compatibility with v4l. (1999-08-30)

2. V4L2_TUNER_SUB_LANG1 was added. (1999-09-05)

3. All ioctl() commands that used an integer argument now take a pointer to an integer. Where it makes sense, ioctls will return the actual new value in the integer pointed to by the argument, a common convention in the V4L2 API. The affected ioctls are: VIDIOC_PREVIEW, VIDIOC_STREAMON, VIDIOC_STREAMOFF, VIDIOC_S_FREQ, VIDIOC_S_INPUT, VIDIOC_S_OUTPUT, VIDIOC_S_EFFECT. For example

   ```c
   err = ioctl(fd, VIDIOC_XXX, V4L2_XXX);
   ```

   becomes

   ```c
   int a = V4L2_XXX; err = ioctl(fd, VIDIOC_XXX, &a);
   ```

4. All the different get- and set-format commands were swept into one VIDIOC_G_FMT and VIDIOC_S_FMT ioctl taking a union and a type field selecting the union member as parameter. Purpose is to simplify the API by eliminating several ioctls and to allow new and driver private data streams without adding new ioctls.

   This change obsoletes the following ioctls: VIDIOC_S_INFMT, VIDIOC_G_INFMT, VIDIOC_S_OUTFMT, VIDIOC_G_OUTFMT, VIDIOC_S_VBIFMT and VIDIOC_G_VBIFMT. The image format structure struct
v4l2_format was renamed to struct v4l2_pix_format, while struct v4l2_format is now the enveloping structure for all format negotiations.

5. Similar to the changes above, the VIDIOC_G_PARM and VIDIOC_S_PARM ioctls were merged with VIDIOC_G_OUTPARM and VIDIOC_S_OUTPARM. A type field in the new struct v4l2_streamparm selects the respective union member. This change obsoletes the VIDIOC_G_OUTPARM and VIDIOC_S_OUTPARM ioctls.

6. Control enumeration was simplified, and two new control flags were introduced and one dropped. The catname field was replaced by a group field.

Drivers can now flag unsupported and temporarily unavailable controls with V4L2_CTRL_FLAG_DISABLED and V4L2_CTRL_FLAG_GRABBED respectively. The group name indicates a possibly narrower classification than the category. In other words, there may be multiple groups within a category. Controls within a group would typically be drawn within a group box. Controls in different categories might have a greater separation, or may even appear in separate windows.

7. The struct v4l2_buffer timestamp was changed to a 64 bit integer, containing the sampling or output time of the frame in nanoseconds. Additionally timestamps will be in absolute system time, not starting from zero at the beginning of a stream. The data type name for timestamps is stamp_t, defined as a signed 64-bit integer. Output devices should not send a buffer out until the time in the timestamp field has arrived. I would like to follow SGI’s lead, and adopt a multimedia timestamping system like their UST (Unadjusted System Time). See http://web.archive.org/web/*/http://reality.sgi.com/cpirazzi-engr/lg/time/intro.html. UST uses timestamps that are 64-bit signed integers (not struct timeval’s) and given in nanosecond units. The UST clock starts at zero when the system is booted and runs continuously and uniformly. It takes a little over 292 years for UST to overflow. There is no way to set the UST clock. The regular Linux time-of-day clock can be changed periodically, which would cause errors if it were being used for timestamping a multimedia stream. A real UST style clock will require some support in the kernel that is not there yet. But in anticipation, I will change the timestamp field to a 64-bit integer, and I will change the v4l2_masterclock_gettime() function (used only by drivers) to return a 64-bit integer.

8. A sequence field was added to struct v4l2_buffer. The sequence field counts captured frames, it is ignored by output devices. When a capture driver drops a frame, the sequence number of that frame is skipped.

V4L2 Version 0.20 incremental changes

1999-12-23: In struct v4l2_vbi_format the reserved1 field became offset. Previously drivers were required to clear the reserved1 field.

2000-01-13: The V4L2_FMT_FLAG_NOT_INTERLACED flag was added.

2000-07-31: The linux/poll.h header is now included by videodev.h for compatibility with the original videodev.h file.

2000-11-20: V4L2_TYPE_VBI_OUTPUT and V4L2_PIX_FMT_Y41P were added.

2000-11-25: V4L2_TYPE_VBI_INPUT was added.

2000-12-04: A couple typos in symbol names were fixed.

2001-01-18: To avoid namespace conflicts the fourcc macro defined in the videodev.h header file was renamed to v4l2_fourcc.

2001-01-25: A possible driver-level compatibility problem between the videodev.h file in Linux 2.4.0 and the videodev.h file included in the videodevX patch was fixed. Users of an earlier version of videodevX on Linux 2.4.0 should recompile their V4L and V4L2 drivers.

2001-01-26: A possible kernel-level incompatibility between the videodev.h file in the videodevX patch and the videodev.h file in Linux 2.2.x with devfs patches applied was fixed.
2001-03-02: Certain V4L ioctls which pass data in both direction although they are defined with read-only parameter, did not work correctly through the backward compatibility layer. [Solution?]

2001-04-13: Big endian 16-bit RGB formats were added.

2001-09-17: New YUV formats and the \texttt{VIDIOC\_G\_FREQUENCY} and \texttt{VIDIOC\_S\_FREQUENCY} ioctls were added. (The old \texttt{VIDIOC\_G\_FREQ} and \texttt{VIDIOC\_S\_FREQ} ioctls did not take multiple tuners into account.)

2000-09-18: \texttt{V4L2\_BUF\_TYPE\_VBI} was added. This may break compatibility as the \texttt{VIDIOC\_G\_FMT} and \texttt{VIDIOC\_S\_FMT} ioctls may fail now if the struct \texttt{struct v4l2\_fmt} type field does not contain \texttt{V4L2\_BUF\_TYPE\_VBI}. In the documentation of the struct \texttt{v4l2\_vbi\_format} offset field the ambiguous phrase “rising edge” was changed to “leading edge”.

\textbf{V4L2 Version 0.20 2000-11-23}

A number of changes were made to the raw VBI interface.

1. Figures clarifying the line numbering scheme were added to the V4L2 API specification. The \texttt{start[0]} and \texttt{start[1]} fields no longer count line numbers beginning at zero. Rationale: a) The previous definition was unclear. b) The \texttt{start[]} values are ordinal numbers. c) There is no point in inventing a new line numbering scheme. We now use line number as defined by ITU-R, period. Compatibility: Add one to the start values. Applications depending on the previous semantics may not function correctly.

2. The restriction “\texttt{count[0]} > 0 and \texttt{count[1]} > 0” has been relaxed to “(\texttt{count[0]} + \texttt{count[1]}) > 0”. Rationale: Drivers may allocate resources at scan line granularity and some data services are transmitted only on the first field. The comment that both count values will usually be equal is misleading and pointless and has been removed. This change breaks compatibility with earlier versions: Drivers may return \texttt{EINVAL}, applications may not function correctly.

3. Drivers are again permitted to return negative (unknown) start values as proposed earlier. Why this feature was dropped is unclear. This change may break compatibility with applications depending on the start values being positive. The use of \texttt{EBUSY} and \texttt{EINVAL} error codes with the \texttt{VIDIOC\_S\_FMT} ioctl was clarified. The \texttt{EBUSY} error code was finally documented, and the \texttt{reserved2} field which was previously mentioned only in the \texttt{videodev.h} header file.

4. New buffer types \texttt{V4L2\_TYPE\_VBI\_INPUT} and \texttt{V4L2\_TYPE\_VBI\_OUTPUT} were added. The former is an alias for the old \texttt{V4L2\_TYPE\_VBI}, the latter was missing in the \texttt{videodev.h} file.

\textbf{V4L2 Version 0.20 2002-07-25}

Added sliced VBI interface proposal.

\textbf{V4L2 in Linux 2.5.46, 2002-10}

Around October-November 2002, prior to an announced feature freeze of Linux 2.5, the API was revised, drawing from experience with V4L2 0.20. This unnamed version was finally merged into Linux 2.5.46.

1. As specified in Related Devices, drivers must make related device functions available under all minor device numbers.

2. The \texttt{open()} function requires access mode \texttt{O\_RDWR} regardless of the device type. All V4L2 drivers exchanging data with applications must support the \texttt{O\_NONBLOCK} flag. The \texttt{O\_NOIO} flag, a V4L2 symbol which aliased the meaningless \texttt{O\_TRUNC} to indicate accesses without data exchange (panel applications) was dropped. Drivers must stay in “panel mode” until the application attempts to initiate a data exchange, see Opening and Closing Devices.

3. The struct \texttt{v4l2\_capability} changed dramatically. Note that also the size of the structure changed, which is encoded in the ioctl request code, thus older V4L2 devices will respond with an \texttt{EINVAL} error code to the new \texttt{ioctl \texttt{VIDIOC\_QUERYCAP}} ioctl.
There are new fields to identify the driver, a new RDS device function V4L2_CAP_RDS_CAPTURE, the V4L2_CAP_AUDIO flag indicates if the device has any audio connectors, another I/O capability V4L2_CAP_ASYNCIO can be flagged. In response to these changes the type field became a bit set and was merged into the flags field. V4L2_FLAG_TUNER was renamed to V4L2_CAP_TUNER, V4L2_CAP_VIDEO_OVERLAY replaced V4L2_FLAG_PREVIEW and V4L2_CAP_VBI_CAPTURE and V4L2_CAP_VBI_OUTPUT replaced V4L2_FLAG_DATA_SERVICE. V4L2_FLAG_READ and V4L2_FLAG_WRITE were merged into V4L2_CAP_READWRITE.

The redundant fields inputs, outputs and audios were removed. These properties can be determined as described in Video Inputs and Outputs and Audio Inputs and Outputs.

The somewhat volatile and therefore barely useful fields maxwidth, maxheight, minwidth, minheight, maxframerate were removed. This information is available as described in Data Formats and Video Standards.

V4L2_FLAG_SELECT was removed. We believe the select() function is important enough to require support of it in all V4L2 drivers exchanging data with applications. The redundant V4L2_FLAG_MONOCHROME flag was removed, this information is available as described in Data Formats.

4. In struct v4l2_input the assoc_audio field and the capability field and its only flag V4L2_INPUT_CAP_AUDIO was replaced by the new audioset field. Instead of linking one video input to one audio input this field reports all audio inputs this video input combines with.

New fields are tuner (reversing the former link from tuners to video inputs), std and status. Accordingly struct v4l2_output lost its capability and assoc_audio fields. audioset, modulator and std where added instead.

5. The struct v4l2_audio field audio was renamed to index, for consistency with other structures. A new capability flag V4L2_AUDIOCAP_STEREO was added to indicated if the audio input in question supports stereo sound. V4L2_AUDIOCAP_EFFECTS and the corresponding V4L2_AUDMODE flags where removed. This can be easily implemented using controls. (However the same applies to AVL which is still there.)

Again for consistency the struct v4l2_audioout field audio was renamed to index.

6. The struct v4l2_tuner input field was replaced by an index field, permitting devices with multiple tuners. The link between video inputs and tuners is now reversed, inputs point to their tuner. The std substructure became a simple set (more about this below) and moved into struct v4l2_input. A type field was added.

Accordingly in struct v4l2_modulator the output was replaced by an index field.

In struct v4l2_frequency the port field was replaced by a tuner field containing the respective tuner or modulator index number. A tuner type field was added and the reserved field became larger for future extensions (satellite tuners in particular).

7. The idea of completely transparent video standards was dropped. Experience showed that applications must be able to work with video standards beyond presenting the user a menu. Instead of enumerating supported standards with an ioctl applications can now refer to standards by name. A tuner status field was removed. This information is available as described in Video Standards.

Instruct v4l2_enumstd ceased to be. ioctl VIDIOC_ENUMSTD now takes a pointer to a struct v4l2_standard directly. The information which standards are supported by a particular video input or output moved into struct v4l2_input and struct v4l2_output fields named std, respectively.

8. The struct v4l2_queryctrl fields category and group did not catch on and/or were not implemented as expected and therefore removed.
9. The `VIDIOC_TRY_FMT` ioctl was added to negotiate data formats as with `VIDIOC_S_FMT`, but without the overhead of programming the hardware and regardless of I/O in progress.

In struct `v4l2_format` the fmt union was extended to contain struct `v4l2_window`. All image format negotiations are now possible with `VIDIOC_G_FMT`, `VIDIOC_S_FMT` and `VIDIOC_TRY_FMT`; ioctl. The `VIDIOC_G_WIN` and `VIDIOC_S_WIN` ioctl to prepare for a video overlay were removed. The type field changed to type enum `v4l2_buf_type` and the buffer type names changed as follows.

<table>
<thead>
<tr>
<th>Old defines</th>
<th>enum v4l2_buf_type</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_BUF_TYPE_CAPTURE</td>
<td>V4L2_BUF_TYPE_VIDEO_CAPTURE</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_CODECIN</td>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_CODECOUT</td>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_EFFECTSIN</td>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_EFFECTSIN2</td>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_EFFECTSOUT</td>
<td>Omitted for now</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_VIDEOOUT</td>
<td>V4L2_BUF_TYPE_VIDEO_OUTPUT</td>
</tr>
<tr>
<td>-</td>
<td>V4L2_BUF_TYPE_VIDEO_OVERLAY</td>
</tr>
<tr>
<td>-</td>
<td>V4L2_BUF_TYPE_VBI_CAPTURE</td>

<tr>
<td>-</td>
<td>V4L2_BUF_TYPE_SLICED_VBI_OUTPUT</td>
</tr>
<tr>
<td>V4L2_BUF_TYPE_PRIVATE_BASE</td>
<td>V4L2_BUF_TYPE_PRIVATE (but this is deprecated)</td>
</tr>
</tbody>
</table>

10. In struct `v4l2_fmdesc` a enum `v4l2_buf_type` field named type was added as in struct `v4l2_format`. The `VIDIOC_ENUM_FBUFFMT` ioctl is no longer needed and was removed. These calls can be replaced by `ioctl VIDIOC_ENUM_FMT` with type `V4L2_BUF_TYPE_VIDEO_OVERLAY`.

11. In struct `v4l2_pix_format` the depth field was removed, assuming applications which recognize the format by its four-character-code already know the color depth, and others do not care about it. The same rationale lead to the removal of the `V4L2_FMT_FLAG_COMPRESSED` flag. The `V4L2_FMT_FLAG_SWCONVECOMPRESSED` flag was removed because drivers are not supposed to convert images in kernel space. A user library of conversion functions should be provided instead. The `V4L2_FMT_FLAG_BYTESPERLINE` flag was redundant. Applications can set the bytesperline field to zero to get a reasonable default. Since the remaining flags were replaced as well, the flags field itself was removed.

The interlace flags were replaced by a enum `v4l2_field` value in a newly added field field.

<table>
<thead>
<tr>
<th>Old flag</th>
<th>enum v4l2_field</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_FMT_FLAG_NOT_INTERLACED</td>
<td>?</td>
</tr>
<tr>
<td>V4L2_FMT_FLAG_INTERLACED = V4L2_FMT_FLAG_COMBINED</td>
<td>V4L2_FIELD_INTERLACED</td>
</tr>
<tr>
<td>V4L2_FMT_FLAG_TOPFIELD = V4L2_FMT_FLAG_ODDFIELD</td>
<td>V4L2_FIELD_TOP</td>
</tr>
<tr>

</tr>
<tr>
<td>-</td>
<td>V4L2_FIELD_SEQ_BT</td>
</tr>
<tr>
<td>-</td>
<td>V4L2_FIELD_ALTERNATE</td>
</tr>
</tbody>
</table>

The color space flags were replaced by a enum `v4l2_colorspace` value in a newly added colorspace field, where one of `V4L2_COLORSPACE_SMPTE170M`, `V4L2_COLORSPACE_BT778`, `V4L2_COLORSPACE_470_SYSTEM_M` or `V4L2_COLORSPACE_470_SYSTEM_BG` replaces `V4L2_FMT_CS_601YUV`.

12. In struct `v4l2_requestbuffers` the type field was properly defined as enum `v4l2_buf_type`. Buffer types changed as mentioned above. A new memory field of type enum `v4l2_memory` was added to distinguish between I/O methods using buffers allocated by the driver or the application. See Input/Output for details.

13. In struct `v4l2_buffer` the type field was properly defined as enum `v4l2_buf_type`. Buffer types changed as mentioned above. A field field of type enum `v4l2_field` was added to indicate if a buffer contains a top or bottom field. The old field flags were removed. Since no unadjusted system time clock was added to the kernel as planned, the timestamp field changed back from type `stamp_t`, an unsigned 64 bit integer expressing the sample time in nanoseconds, to struct `timeval`.
With the addition of a second memory mapping method the offset field moved into union m, and a new memory field of type enum v4l2_memory was added to distinguish between I/O methods. See Input/Output for details.

The V4L2_BUF_REQ_CONTIG flag was used by the V4L compatibility layer, after changes to this code it was no longer needed. The V4L2_BUF_ATTR_DEVICEMEM flag would indicate if the buffer was indeed allocated in device memory rather than DMA-able system memory. It was barely useful and so was removed.

14. In struct v4l2_framebuffer the base[3] array anticipating double- and triple-buffering in off-screen video memory, however without defining a synchronization mechanism, was replaced by a single pointer. The V4L2_FBUF_CAP_SCALEUP and V4L2_FBUF_CAP_SCALEDOWN flags were removed. Applications can determine this capability more accurately using the new cropping and scaling interface. The V4L2_FBUF_CAP_CLIPPING flag was replaced by V4L2_FBUF_CAP_LIST_CLIPPING and V4L2_FBUF_CAP_BITMAP_CLIPPING.

15. In struct v4l2_clip the x, y, width and height field moved into a c substructure of type struct v4l2_rect. The x and y fields were renamed to left and top, i.e. offsets to a context dependent origin.

16. In struct v4l2_window the x, y, width and height field moved into a w substructure as above. A field field of type %v4l2-field was added to distinguish between field and frame (interlaced) overlay.

17. The digital zoom interface, including struct struct v4l2_zoomcap, struct struct v4l2_zoom, V4L2_ZOOM_NONCAP and V4L2_ZOOM_WHILESTREAMING was replaced by a new cropping and scaling interface. The previously unused struct struct v4l2_cropcap and struct v4l2_crop where redefined for this purpose. See Image Cropping, Insertion and Scaling for details.

18. In struct v4l2_vbi_format the SAMPLE_FORMAT field now contains a four-character-code as used to identify video image formats and V4L2_PIX_FMT_GREY replaces the V4L2_VBI_SF_UBYTE define. The reserved field was extended.

19. In struct v4l2_captureparm the type of the timeperframe field changed from unsigned long to struct v4l2_fract. This allows the accurate expression of multiples of the NTSC-M frame rate 30000 / 1001. A new field readbuffers was added to control the driver behaviour in read I/O mode.

Similar changes were made to struct v4l2_outputparm.

20. The struct struct v4l2_performance and VIDIOC_G_PERF ioctl were dropped. Except when using the read/write I/O method, which is limited anyway, this information is already available to applications.

21. The example transformation from RGB to YCbCr color space in the old V4L2 documentation was inaccurate, this has been corrected in Image Formats.

V4L2 2003-06-19

1. A new capability flag V4L2_CAP_RADIO was added for radio devices. Prior to this change radio devices would identify solely by having exactly one tuner whose type field reads V4L2_TUNER_RADIO.

2. An optional driver access priority mechanism was added, see Application Priority for details.

3. The audio input and output interface was found to be incomplete.

Previously the VIDIOC_G_AUDIO ioctl would enumerate the available audio inputs. An ioctl to determine the current audio input, if more than one combines with the current video input, did not exist. So VIDIOC_G_AUDIO was renamed to VIDIOC_G_AUDIO_OLD, this ioctl was removed on Kernel 2.6.39. The ioctl VIDIOC_ENUMAUDIO ioctl was added to enumerate audio inputs, while VIDIOC_G_AUDIO now reports the current audio input.

The same changes were made to VIDIOC_G_AUDOUT and VIDIOC_ENUMAUDOUT.

Until further the “videodev” module will automatically translate between the old and new ioctls, but drivers and applications must be updated to successfully compile again.
4. The `ioctl VIDIOC_OVERLAY` ioctl was incorrectly defined with write-read parameter. It was changed to write-only, while the write-read version was renamed to VIDIOC_OVERLAY_OLD. The old ioctl was removed on Kernel 2.6.39. Until further the “videodev” kernel module will automatically translate to the new version, so drivers must be recompiled, but not applications.

5. Video Overlay Interface incorrectly stated that clipping rectangles define regions where the video can be seen. Correct is that clipping rectangles define regions where no video shall be displayed and so the graphics surface can be seen.

6. The `VIDIOC_S_PARM` and `VIDIOC_S_CTRL` ioctls were defined with write-only parameter, inconsistent with other ioctls modifying their argument. They were changed to write-read, while a _OLD suffix was added to the write-only versions. The old ioctls were removed on Kernel 2.6.39. Drivers and applications assuming a constant parameter need an update.

V4L2 2003-11-05

1. In RGB Formats the following pixel formats were incorrectly transferred from Bill Dirks’ V4L2 specification. Descriptions below refer to bytes in memory, in ascending address order.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>In this document prior to revision 0.5</th>
<th>Corrected</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_PIX_FMT_RGB24</td>
<td>B, G, R</td>
<td>R, G, B</td>
</tr>
</tbody>
</table>

The V4L2_PIX_FMT_BGR24 example was always correct.

In Image Properties the mapping of the V4L VIDEO_PALETTE_RGB24 and VIDEO_PALETTE_RGB32 formats to V4L2 pixel formats was accordingly corrected.

2. Unrelated to the fixes above, drivers may still interpret some V4L2 RGB pixel formats differently. These issues have yet to be addressed, for details see RGB Formats.

V4L2 in Linux 2.6.6, 2004-05-09

1. The `ioctl VIDIOC_CROPCAP` ioctl was incorrectly defined with read-only parameter. It is now defined as write-read ioctl, while the read-only version was renamed to VIDIOC_CROPCAP_OLD. The old ioctl was removed on Kernel 2.6.39.

V4L2 in Linux 2.6.8

1. A new field input (former reserved[0]) was added to the struct `v4l2_buffer` structure. Purpose of this field is to alternate between video inputs (e. g. cameras) in step with the video capturing process. This function must be enabled with the new V4L2_BUF_FLAG_INPUT flag. The flags field is no longer read-only.

V4L2 spec erratum 2004-08-01

1. The return value of the `V4L2 open()` function was incorrectly documented.

2. Audio output ioctls end in -AUDOUT, not -AUDIOOUT.

3. In the Current Audio Input example the VIDIOC_G_AUDIO ioctl took the wrong argument.

4. The documentation of the `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` and `VIDIOC_DQBUF` ioctls did not mention the struct `v4l2_buffer` memory field. It was also missing from examples. Also on the VIDIOC_DQBUF page the EIO error code was not documented.
V4L2 in Linux 2.6.14

1. A new sliced VBI interface was added. It is documented in *Sliced VBI Data Interface* and replaces the interface first proposed in V4L2 specification 0.8.

V4L2 in Linux 2.6.15

1. The `ioctl VIDIOC_LOG_STATUS` ioctl was added.
2. New video standards `V4L2_STD_NTSC_443`, `V4L2_STD_SECAM_LC`, `V4L2_STD_SECAM_DK` (a set of SECAM D, K and K1), and `V4L2_STD_ATSC` (a set of `V4L2_STD_ATSC_8_VSB` and `V4L2_STD_ATSC_16_VSB`) were defined. Note the `V4L2_STD_525_60` set now includes `V4L2_STD_NTSC_443`. See also `typedef v4l2_std_id`.
3. The `VIDIOC_G_COMP` and `VIDIOC_S_COMP` ioctl were renamed to `VIDIOC_G_MPEGCOMP` and `VIDIOC_S_MPEGCOMP` respectively. Their argument was replaced by a struct `struct v4l2_mpeg_compression` pointer. (The `VIDIOC_G_MPEGCOMP` and `VIDIOC_S_MPEGCOMP` ioctls were removed in Linux 2.6.25.)

V4L2 spec erratum 2005-11-27

The capture example in *Video Capture Example* called the `VIDIOC_S_CROP` ioctl without checking if cropping is supported. In the video standard selection example in *Video Standards* the `VIDIOC_S_STD` call used the wrong argument type.

V4L2 spec erratum 2006-01-10

1. The `V4L2_IN_ST_COLOR_KILL` flag in struct `v4l2_input` not only indicates if the color killer is enabled, but also if it is active. (The color killer disables color decoding when it detects no color in the video signal to improve the image quality.)
2. `VIDIOC_S_PARM` is a write-read ioctl, not write-only as stated on its reference page. The ioctl changed in 2003 as noted above.

V4L2 spec erratum 2006-02-03

1. In struct `v4l2_captureparm` and struct `v4l2_outputparm` the `timeperframe` field gives the time in seconds, not microseconds.

V4L2 spec erratum 2006-02-04

1. The `clips` field in struct `v4l2_window` must point to an array of struct `v4l2_clip`, not a linked list, because drivers ignore the struct `v4l2_clip` next pointer.

V4L2 in Linux 2.6.17

1. New video standard macros were added: `V4L2_STD_NTSC_M_KR` (NTSC M South Korea), and the sets `V4L2_STD_MN`, `V4L2_STD_B`, `V4L2_STD_GH` and `V4L2_STD_DK`. The `V4L2_STD_NTSC` and `V4L2_STD_SECAM` sets now include `V4L2_STD_NTSC_M_KR` and `V4L2_STD_SECAM_LC` respectively.
2. A new `V4L2_TUNER_MODE_LANG1_LANG2` was defined to record both languages of a bilingual program. The use of `V4L2_TUNER_MODE_STERE0` for this purpose is deprecated now. See the `VIDIOC_G_TUNER` section for details.
V4L2 spec erratum 2006-09-23 (Draft 0.15)

1. In various places V4L2_BUF_TYPE_SLICED_VBI_CAPTURE and V4L2_BUF_TYPE_SLICED_VBI_OUTPUT of the sliced VBI interface were not mentioned along with other buffer types.
2. In VIDIOC_G_AUDIO it was clarified that the struct v4l2_audio mode field is a flags field.
3. ioctl VIDIOC_QUERYCAP did not mention the sliced VBI and radio capability flags.
4. In VIDIOC_G_FREQUENCY it was clarified that applications must initialize the tuner type field of struct v4l2_frequency before calling VIDIOC_S_FREQUENCY.
5. The reserved array in struct v4l2_requestbuffers has 2 elements, not 32.
6. In Video Output Interface and Raw VBI Data Interface the device file names /dev/vout which never caught on were replaced by /dev/video.
7. With Linux 2.6.15 the possible range for VBI device minor numbers was extended from 224-239 to 224-255. Accordingly device file names /dev/vbi0 to /dev/vbi31 are possible now.

V4L2 in Linux 2.6.18

1. New ioctls VIDIOC_G_EXT_CTRLS, VIDIOC_S_EXT_CTRLS and VIDIOC_TRY_EXT_CTRLS were added, a flag to skip unsupported controls with ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU, new control types V4L2_CTRL_TYPE_INTEGER64 and V4L2_CTRL_TYPE_CTRL_CLASS (enum v4l2_ctrl_type), and new control flags V4L2_CTRL_FLAG_READ_ONLY, V4L2_CTRL_FLAG_UPDATE, V4L2_CTRL_FLAG_INACTIVE and V4L2_CTRL_FLAG_SLIDER (Control Flags). See Extended Controls for details.

V4L2 in Linux 2.6.19

1. In struct v4l2_sliced_vbi_cap a buffer type field was added replacing a reserved field. Note on architectures where the size of enum types differs from int types the size of the structure changed. The VIDIOC_G_SLICED_VBI_CAP ioctl was redefined from being read-only to write-read. Applications must initialize the type field and clear the reserved fields now. These changes may break the compatibility with older drivers and applications.
2. The ioctls ioctlVIDIOC_ENUM_FRAMESIZES and ioctlVIDIOC_ENUM_FRAMEINTERVALS were added.
3. A new pixel format V4L2_PIX_FMT_RGB444 (Packed RGB Image Formats) was added.

V4L2 spec erratum 2006-10-12 (Draft 0.17)

1. V4L2_PIX_FMT_HM12 (Reserved Image Formats) is a YUV 4:2:0, not 4:2:2 format.

V4L2 in Linux 2.6.21

1. The videodev2.h header file is now dual licensed under GNU General Public License version two or later, and under a 3-clause BSD-style license.

V4L2 in Linux 2.6.22

1. Two new field orders V4L2_FIELD_INTERLACED_TB and V4L2_FIELD_INTERLACED_BT were added. See enum v4l2_field for details.
2. Three new clipping/blending methods with a global or straight or inverted local alpha value were added to the video overlay interface. See the description of the `VIDIOC_G_FBUF` and `VIDIOC_S_FBUF` ioctls for details.

A new global alpha field was added to `v4l2_window`, extending the structure. This may break compatibility with applications using a struct struct `v4l2_window` directly. However the `VIDIOC_G/S/TRY_FMT` ioctls, which take a pointer to a `v4l2_format` parent structure with padding bytes at the end, are not affected.

3. The format of the chromakey field in struct `v4l2_window` changed from “host order RGB32” to a pixel value in the same format as the framebuffer. This may break compatibility with existing applications.

Drivers supporting the “host order RGB32” format are not known.

**V4L2 in Linux 2.6.24**

1. The pixel formats `V4L2_PIX_FMT_PAL8`, `V4L2_PIX_FMT_YUV444`, `V4L2_PIX_FMT_YUV555`, `V4L2_PIX_FMT_YUV565` and `V4L2_PIX_FMT_YUV32` were added.

**V4L2 in Linux 2.6.25**

1. The pixel formats `V4L2_PIX_FMT_Y16` and `V4L2_PIX_FMT_SBGGR16` were added.

2. New controls `V4L2_CID_POWER_LINE_FREQUENCY`, `V4L2_CID_HUE_AUTO`, `V4L2_CID_WHITE_BALANCE_TEMPERATURE`, `V4L2_CID_SHARPNESS` and `V4L2_CID_BACKLIGHT_COMPENSATION` were added. The controls `V4L2_CID_BLACK_LEVEL`, `V4L2_CID_WHITENESS`, `V4L2_CID_HCENTER` and `V4L2_CID_VCENTER` were deprecated.

4. The `VIDIOC_G_MPEGCOMP` and `VIDIOC_S_MPEGCOMP` ioctls, which were superseded by the extended controls interface in Linux 2.6.18, where finally removed from the videodev2.h header file.

**V4L2 in Linux 2.6.26**

1. The pixel formats `V4L2_PIX_FMT_Y16` and `V4L2_PIX_FMT_SBGGR16` were added.

2. Added user controls `V4L2_CID_CHROMA_AGC` and `V4L2_CID_COLOR_KILLER`.

**V4L2 in Linux 2.6.27**

1. The `ioctl VIDIOC_S_HW_FREQSEEK` ioctl and the `V4L2_CAP_HW_FREQSEEK` capability were added.

**V4L2 in Linux 2.6.28**

1. Added `V4L2_MPEG_AUDIO_ENCODING_AAC` and `V4L2_MPEG_AUDIO_ENCODING_AC3` MPEG audio encodings.

2. Added `V4L2_MPEG_VIDEO_ENCODING_MPEG_4` MPEG video encoding.

3. The pixel formats `V4L2_PIX_FMT_SGRBG10` and `V4L2_PIX_FMT_SGRBG10DPCM8` were added.

1.2. Part I - Video for Linux API
V4L2 in Linux 2.6.29

1. The VIDIOC_G_CHIP_IDENT ioctl was renamed to VIDIOC_G_CHIP_IDENT_OLD and VIDIOC_DBG_G_CHIP_IDENT was introduced in its place. The old struct struct v4l2_chip_ident was renamed to struct v4l2_chip_ident_old.
2. The pixel formats V4L2_PIX_FMT_VYUY, V4L2_PIX_FMT_NV16 and V4L2_PIX_FMT_NV61 were added.
3. Added camera controls V4L2_CID_ZOOM_ABSOLUTE, V4L2_CID_ZOOM_RELATIVE, V4L2_CID_ZOOM_CONTINUOUS and V4L2_CID_PRIVACY.

V4L2 in Linux 2.6.30

1. New control flag V4L2_CTRL_FLAG_WRITE_ONLY was added.
2. New control V4L2_CID_COLORFX was added.

V4L2 in Linux 2.6.32

1. In order to be easier to compare a V4L2 API and a kernel version, now V4L2 API is numbered using the Linux Kernel version numeration.
2. Finalized the RDS capture API. See RDS Interface for more information.
3. Added new capabilities for modulators and RDS encoders.
4. Add description for libv4l API.
5. Added support for string controls via new type V4L2_CTRL_TYPE_STRING.
7. Added FM Modulator (FM TX) Extended Control Class: V4L2_CTRL_CLASS_FM_TX and their Control IDs.

V4L2 in Linux 2.6.33

1. Added support for Digital Video timings in order to support HDTV receivers and transmitters.

V4L2 in Linux 2.6.34

1. Added V4L2_CID_IRIS_ABSOLUTE and V4L2_CID_IRIS_RELATIVE controls to the Camera controls class.

V4L2 in Linux 2.6.37

1. Remove the vtx (videotext/teletext) API. This API was no longer used and no hardware exists to verify the API. Nor were any userspace applications found that used it. It was originally scheduled for removal in 2.6.35.
V4L2 in Linux 2.6.39

1. The old VIDIOC_*_OLD symbols and V4L1 support were removed.
2. Multi-planar API added. Does not affect the compatibility of current drivers and applications. See
   multi-planar API for details.

V4L2 in Linux 3.1

1. VIDIOC_QUERYCAP now returns a per-subsystem version instead of a per-driver one.
   Standardize an error code for invalid ioctl.
   Added V4L2_CTRL_TYPE_BITMASK.

V4L2 in Linux 3.2

1. V4L2_CTRL_FLAG_VOLATILE was added to signal volatile controls to userspace.
2. Add selection API for extended control over cropping and composing. Does not affect the compati-
   bility of current drivers and applications. See selection API for details.

V4L2 in Linux 3.3

1. Added V4L2_CID_ALPHA_COMPONENT control to the User controls class.
2. Added the device_caps field to struct v4l2_capabilities and added the new V4L2_CAP_DEVICE_CAPS
   capability.

V4L2 in Linux 3.4

1. Added JPEG compression control class.
2. Extended the DV Timings API: ioctl VIDIOC_ENUM_DV_TIMINGS, VIDIOC_SUBDEV_ENUM_DV_TIMINGS,
   ioctl VIDIOC_QUERY_DV_TIMINGS and ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP.

V4L2 in Linux 3.5

1. Added integer menus, the new type will be V4L2_CTRL_TYPE_INTEGER_MENU.
2. Added selection API for V4L2 subdev interface: ioctl VIDIOC_SUBDEV_G_SELECTION, VID-
   IOC_SUBDEV_S_SELECTION and VIDIOC_SUBDEV_S_SELECTION.
3. Added V4L2_COLORFX_ANTIQUE, V4L2_COLORFX_ART_FREEZE, V4L2_COLORFX_AQUA,
   V4L2_COLORFX_SILHOUETTE, V4L2_COLORFX_SOLARIZATION, V4L2_COLORFX_VIVID and
   V4L2_COLORFX_ARBITRARY_CBCR menu items to the V4L2_CID_COLORFX control.
4. Added V4L2_CID_COLORFX_CBCR control.
5. Added camera controls V4L2_CID_AUTO_EXPOSURE_BIAS, V4L2_CID_AUTO_N_PRESET_WHITE_BALANCE,
   V4L2_CID_IMAGE_STABILIZATION, V4L2_CID_ISO_SENSITIVITY, V4L2_CID_ISO_SENSITIVITY_AUTO,
   V4L2_CID_EXPOSURE_METERING, V4L2_CID_SCENE_MODE, V4L2_CID_3A_LOCK, V4L2_CID_AUTO_FOCUS_START,
   V4L2_CID_AUTO_FOCUS_STOP, V4L2_CID_AUTO_FOCUS_STATUS and V4L2_CID_AUTO_FOCUS_RANGE.
V4L2 in Linux 3.6

1. Replaced input in struct v4l2_buffer by reserved2 and removed V4L2_BUF_FLAG_INPUT.
3. Added support for frequency band enumerations: ioctl VIDIOC_ENUM_FREQ_BANDS.

V4L2 in Linux 3.9

1. Added timestamp types to flags field in struct v4l2_buffer. See Buffer Flags.
2. Added V4L2_EVENT_CTRL_CH_RANGE control event changes flag. See Control Changes.

V4L2 in Linux 3.10

1. Removed obsolete and unused DV_PRESET ioctls VIDIOC_G_DV_PRESET, VIDIOC_S_DV_PRESET, VIDIOC_QUERY_DV_PRESET and VIDIOC_ENUM_DV_PRESET. Remove the related v4l2_input/output capability flags V4L2_IN_CAP_PRESETS and V4L2_OUT_CAP_PRESETS.
2. Added new debugging ioctl ioctlVIDIOCDBG_G_CHIP_INFO.

V4L2 in Linux 3.11

1. Remove obsolete VIDIOCDBG_G_CHIP_IDENT ioctl.

V4L2 in Linux 3.14

1. In struct struct v4l2_rect, the type of width and height fields changed from _s32 to _u32.

V4L2 in Linux 3.15

V4L2 in Linux 3.16

1. Added event V4L2_EVENT_SOURCE_CHANGE.

V4L2 in Linux 3.17

1. Extended struct v4l2_pix_format. Added format flags.
2. Added compound control types and VIDIOC_QUERY_EXT_CTRL.

V4L2 in Linux 3.18

1. Added V4L2_CID_PAN_SPEED and V4L2_CID_TILT_SPEED camera controls.

V4L2 in Linux 3.19

1. Rewrote Colorspace chapter, added new enum v4l2_yCBCR_encoding and enum v4l2_quantization fields to struct v4l2_pix_format, struct v4l2_pix_format_mplane and struct v4l2_mbus_framefmt.
V4L2 in Linux 4.4

1. Renamed `V4L2_TUNER_ADC` to `V4L2_TUNER_SDR`. The use of `V4L2_TUNER_ADC` is deprecated now.
2. Added `V4L2_CID_RF_TUNER_RF_GAIN` RF Tuner control.

Relation of V4L2 to other Linux multimedia APIs

X Video Extension

The X Video Extension (abbreviated XVideo or just Xv) is an extension of the X Window system, implemented for example by the XFree86 project. Its scope is similar to V4L2, an API to video capture and output devices for X clients. Xv allows applications to display live video in a window, send window contents to a TV output, and capture or output still images in XPixmaps. With their implementation XFree86 makes the extension available across many operating systems and architectures.

Because the driver is embedded into the X server Xv has a number of advantages over the V4L2 video overlay interface. The driver can easily determine the overlay target, i.e., visible graphics memory or off-screen buffers for a destructive overlay. It can program the RAMDAC for a non-destructive overlay, scaling or color-keying, or the clipping functions of the video capture hardware, always in sync with drawing operations or windows moving or changing their stacking order.

To combine the advantages of Xv and V4L a special Xv driver exists in XFree86 and XOrg, just programming any overlay capable Video4Linux device it finds. To enable it `/etc/X11/XF86Config` must contain these lines:

```plaintext
Section "Module"
    Load "v4l"
EndSection
```

As of XFree86 4.2 this driver still supports only V4L ioctls, however it should work just fine with all V4L2 devices through the V4L2 backward-compatibility layer. Since V4L2 permits multiple opens it is possible (if supported by the V4L2 driver) to capture video while an X client requested video overlay. Restrictions of simultaneous capturing and overlay are discussed in `Video Overlay Interface`. Apply.

Only marginally related to V4L2, XFree86 extended Xv to support hardware YUV to RGB conversion and scaling for faster video playback, and added an interface to MPEG-2 decoding hardware. This API is useful to display images captured with V4L2 devices.

Digital Video

V4L2 does not support digital terrestrial, cable or satellite broadcast. A separate project aiming at digital receivers exists. You can find its homepage at `https://linuxtv.org`. The Linux DVB API has no connection to the V4L2 API except that drivers for hybrid hardware may support both.

Audio Interfaces

[to do - OSS/ALSA]

Experimental API Elements

The following V4L2 API elements are currently experimental and may change in the future.

---

1 This is not implemented in XFree86.
• `ioctl VIDIOC_DBG_G_REGISTER, VIDIOC_DBG_S_REGISTER` and `VIDIOC_DBG_S_REGISTER` ioctls.
• `ioctl VIDIOC DBG G CHIP_INFO` ioctl.

Obsolete API Elements

The following V4L2 API elements were superseded by new interfaces and should not be implemented in new drivers.

• `VIDIOC G MPEGCOMP` and `VIDIOC_S MPEGCOMP` ioctls. Use Extended Controls, Extended Controls.
• `VIDIOC_G DV PRESET, VIDIOC_S DV PRESET, VIDIOC_ENUM DV PRESETS` and `VIDIOC_QUERY DV PRESET` ioctls. Use the DV Timings API (Digital Video (DV) Timings).
• `VIDIOC_SUBDEV G CROP` and `VIDIOC_SUBDEV S CROP` ioctls. Use `VIDIOC_SUBDEV G SELECTION` and `VIDIOC_SUBDEV S SELECTION`, ioctl `VIDIOC_SUBDEV G SELECTION, VIDIOC_SUBDEV S SELECTION`.

1.2.8 Function Reference

V4L2 close()

Name

v4l2-close - Close a V4L2 device

Synopsis

```c
#include <unistd.h>

int close(int fd)
```

Arguments

`fd` File descriptor returned by `open`.

Description

Closes the device. Any I/O in progress is terminated and resources associated with the file descriptor are freed. However data format parameters, current input or output, control values or other properties remain unchanged.

Return Value

The function returns 0 on success, -1 on failure and the `errno` is set appropriately. Possible error codes:

- `EBADF` `fd` is not a valid open file descriptor.

V4L2 ioctl()

Name

v4l2-ioct1 - Program a V4L2 device
Synopsis

```c
#include <sys/ioctl.h>

int ioctl(int fd, int request, void *argp)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `request` V4L2 ioctl request code as defined in the `videodev2.h` header file, for example `VIDIOC_QUERYCAP`.
- `argp` Pointer to a function parameter, usually a structure.

Description

The `ioctl()` function is used to program V4L2 devices. The argument `fd` must be an open file descriptor. An ioctl request has encoded in it whether the argument is an input, output or read/write parameter, and the size of the argument `argp` in bytes. Macros and defines specifying V4L2 ioctl requests are located in the `videodev2.h` header file. Applications should use their own copy, not include the version in the kernel sources on the system they compile on. All V4L2 ioctl requests, their respective function and parameters are specified in `Function Reference`.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

When an ioctl that takes an output or read/write parameter fails, the parameter remains unmodified.

`ioctl VIDIOC_CREATE_BUFS`

Name

VIDIOC_CREATE_BUFS - Create buffers for Memory Mapped or User Pointer or DMA Buffer I/O

Synopsis

```c
int ioctl(int fd, VIDIOC_CREATE_BUFS, struct v4l2_create_buffers *argp)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `argp`

Description

This ioctl is used to create buffers for `memory mapped` or `user pointer` or `DMA buffer` I/O. It can be used as an alternative or in addition to the `ioctl VIDIOC_REQBUFS` ioctl, when a tighter control over buffers is required. This ioctl can be called multiple times to create buffers of different sizes.
To allocate the device buffers applications must initialize the relevant fields of the `struct v4l2_create_buffers` structure. The `count` field must be set to the number of requested buffers, the `memory` field specifies the requested I/O method and the `reserved` array must be zeroed.

The format field specifies the image format that the buffers must be able to handle. The application has to fill in this struct `v4l2_format`. Usually this will be done using the `VIDIOC_TRY_FMT` or `VIDIOC_G_FMT` ioctls to ensure that the requested format is supported by the driver. Based on the format’s type field the requested buffer size (for single-planar) or plane sizes (for multi-planar formats) will be used for the allocated buffers. The driver may return an error if the size(s) are not supported by the hardware (usually because they are too small).

The buffers created by this ioctl will have as minimum size the size defined by the `format.pix.sizeimage` field (or the corresponding fields for other format types). Usually if the `format.pix.sizeimage` field is less than the minimum required for the given format, then an error will be returned since drivers will typically not allow this. If it is larger, then the value will be used as-is. In other words, the driver may reject the requested size, but if it is accepted the driver will use it unchanged.

When the ioctl is called with a pointer to this structure the driver will attempt to allocate up to the requested number of buffers and store the actual number allocated and the starting index in the `count` and the `index` fields respectively. On return `count` can be smaller than the number requested.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32 index</td>
<td>The starting buffer index, returned by the driver.</td>
</tr>
<tr>
<td>__u32 count</td>
<td>The number of buffers requested or granted. If <code>count == 0</code>, then <code>ioctl VIDIOC_CREATE_BUFS</code> will set index to the current number of created buffers, and it will check the validity of <code>memory</code> and <code>format.type</code>. If those are invalid -1 is returned and <code>errno</code> is set to EINVAL error code, otherwise <code>ioctl VIDIOC_CREATE_BUFS</code> returns 0. It will never set <code>errno</code> to EBUSY error code in this particular case.</td>
</tr>
<tr>
<td>__u32 memory</td>
<td>Applications set this field to V4L2_MEMORY_MMAP, V4L2_MEMORY_DMABUF or V4L2_MEMORY_USERPTR. See <code>enum v4l2_memory</code>.</td>
</tr>
<tr>
<td>struct v4l2_format</td>
<td>Filled in by the application, preserved by the driver.</td>
</tr>
<tr>
<td>__u32 reserved[8]</td>
<td>A place holder for future extensions. Drivers and applications must set the array to zero.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**ENOMEM** No memory to allocate buffers for memory mapped I/O.

**EINVAL** The buffer type (`format.type` field), requested I/O method (`memory`) or format (`format` field) is not valid.

`ioctl VIDIOC_CROPCAP`

**Name**

VIDIOC_CROPCAP - Information about the video cropping and scaling abilities
Synopsis

```c
int ioctl(int fd, VIDIOC_CROPCAP, struct v4l2_cropcap *argp)
```

Arguments

- `fd`: File descriptor returned by `open()`.
- `argp`: Description

Description

Applications use this function to query the cropping limits, the pixel aspect of images and to calculate scale factors. They set the type field of a `v4l2_cropcap` structure to the respective buffer (stream) type and call the `ioctl VIDIOC_CROPCAP` ioctl with a pointer to this structure. Drivers fill the rest of the structure. The results are constant except when switching the video standard. Remember this switch can occur implicit when switching the video input or output.

Do not use the multiplanar buffer types. Use `V4L2_BUF_TYPE_VIDEO_CAPTURE` instead of `V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE` and use `V4L2_BUF_TYPE_VIDEO_OUTPUT` instead of `V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE`.

This ioctl must be implemented for video capture or output devices that support cropping and/or scaling and/or have non-square pixels, and for overlay devices.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| **type** | Type of the data stream, set by the application. Only these types are valid here: `V4L2_BUF_TYPE_VIDEO_CAPTURE`, `V4L2_BUF_TYPE_VIDEO_OUTPUT` and `V4L2_BUF_TYPE_VIDEO_OVERLAY`. See `enum v4l2_buf_type`.
| **bounds** | Defines the window within capturing or output is possible, this may exclude for example the horizontal and vertical blanking areas. The cropping rectangle cannot exceed these limits. Width and height are defined in pixels, the driver writer is free to choose origin and units of the coordinate system in the analog domain.
| **defrect** | Default cropping rectangle, it shall cover the “whole picture”. Assuming pixel aspect 1/1 this could be for example a 640 × 480 rectangle for NTSC, a 768 × 576 rectangle for PAL and SECAM centered over the active picture area. The same co-ordinate system as for bounds is used.
| **pixelaspect** | This is the pixel aspect (y / x) when no scaling is applied, the ratio of the actual sampling frequency and the frequency required to get square pixels. When cropping coordinates refer to square pixels, the driver sets pixelaspect to 1/1. Other common values are 54/59 for PAL and SECAM, 11/10 for NTSC sampled according to [ITU BT.601].

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

EINVAL The struct `v4l2_cropcap` type is invalid.

ioctl VIDIOC_DBG_G_CHIP_INFO

**Name**

VIDIOC_DBG_G_CHIP_INFO - Identify the chips on a TV card

**Synopsis**

```c
int ioctl(int fd, VIDIOC_DBG_G_CHIP_INFO, struct v4l2_dbg_chip_info *argp)
```

**Arguments**

- *fd* File descriptor returned by `open()`.
- *argp*

**Description**

*Note:*

This is an Experimental API Elements interface and may change in the future.

For driver debugging purposes this ioctl allows test applications to query the driver about the chips present on the TV card. Regular applications must not use it. When you found a chip specific bug, please contact the linux-media mailing list (https://linuxtv.org/lists.php) so it can be fixed.

Additionally the Linux kernel must be compiled with the `CONFIG_VIDEO_ADV_DEBUG` option to enable this ioctl.

To query the driver applications must initialize the `match.type` and `match.addr` or `match.name` fields of a struct `v4l2_dbg_chip_info` and call `ioctl VIDIOC_DBG_G_CHIP_INFO` with a pointer to this structure. On success the driver stores information about the selected chip in the name and flags fields.

When `match.type` is `V4L2_CHIP_MATCH_BRIDGE`, `match.addr` selects the nth bridge ‘chip’ on the TV card. You can enumerate all chips by starting at zero and incrementing `match.addr` by one until `ioctl VIDIOC_DBG_G_CHIP_INFO` fails with an EINVAL error code. The number zero always selects the bridge chip.
itself, e.g. the chip connected to the PCI or USB bus. Non-zero numbers identify specific parts of the bridge chip such as an AC97 register block.

When match.type is V4L2_CHIP_MATCH_SUBDEV, match.addr selects the nth sub-device. This allows you to enumerate over all sub-devices.

On success, the name field will contain a chip name and the flags field will contain V4L2_CHIP_FL_READABLE if the driver supports reading registers from the device or V4L2_CHIP_FL_WRITABLE if the driver supports writing registers to the device.

We recommended the v4l2-dbg utility over calling this ioctl directly. It is available from the LinuxTV v4l-dvb repository; see [https://linuxtv.org/repo/](https://linuxtv.org/repo/) for access instructions.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter. 

**EINVAL** The match_type is invalid or no device could be matched.

**ioctl VIDIOC_DBG_G_REGISTER, VIDIOC_DBG_S_REGISTER**

**Name**

VIDIOC_DBG_G_REGISTER - VIDIOC_DBG_S_REGISTER - Read or write hardware registers

**Synopsis**

```c
int ioctl(int fd, VIDIOC_DBG_G_REGISTER, struct v4l2_dbg_register *argp)
```
int ioctl(int fd, VIDIOC_DBG_S_REGISTER, const struct v4l2_dbg_register *argp)

**Arguments**

**fd** File descriptor returned by `open()`.

**argp**

**Description**

**Note:**

This is an *Experimental API Elements* interface and may change in the future.

For driver debugging purposes these ioctls allow test applications to access hardware registers directly. Regular applications must not use them.

Since writing or even reading registers can jeopardize the system security, its stability and damage the hardware, both ioctls require superuser privileges. Additionally the Linux kernel must be compiled with the `CONFIG_VIDEO_ADV_DEBUG` option to enable these ioctls.

To write a register applications must initialize all fields of a struct `v4l2_dbg_register` except for size and call VIDIOC_DBG_S_REGISTER with a pointer to this structure. The `match.type` and `match.addr` or `match.name` fields select a chip on the TV card, the `reg` field specifies a register number and the `val` field the value to be written into the register.

To read a register applications must initialize the `match.type`, `match.addr` or `match.name` and `reg` fields, and call VIDIOC_DBG_G_REGISTER with a pointer to this structure. On success the driver stores the register value in the `val` field and the size (in bytes) of the value in `size`.

When `match.type` is V4L2_CHIP_MATCH_BRIDGE, `match.addr` selects the nth non-sub-device chip on the TV card. The number zero always selects the host chip, e. g. the chip connected to the PCI or USB bus. You can find out which chips are present with the `ioctl VIDIOC_DBG_G_CHIP_INFO` ioctl.

When `match.type` is V4L2_CHIP_MATCH_SUBDEV, `match.addr` selects the nth sub-device.

These ioctls are optional, not all drivers may support them. However when a driver supports these ioctls it must also support `ioctl VIDIOC_DBG_G_CHIP_INFO`. Conversely it may support VIDIOC_DBG_G_CHIP_INFO but not these ioctls.

VIDIOC_DBG_G_REGISTER and VIDIOC_DBG_S_REGISTER were introduced in Linux 2.6.21, but their API was changed to the one described here in kernel 2.6.29.

We recommended the v4l2-dbg utility over calling these ioctls directly. It is available from the LinuxTV v4l-dvb repository; see https://linuxtv.org/repo/ for access instructions.

**EPERM** Insufficient permissions. Root privileges are required to execute these ioctls.

### ioctl \texttt{VIDIOC_DECODER_CMD}, \texttt{VIDIOC_TRY_DECODER_CMD}

#### Name

\texttt{VIDIOC_DECODER_CMD} - \texttt{VIDIOC_TRY_DECODER_CMD} - Execute an decoder command

#### Synopsis

```c
int ioctl(int fd, \texttt{VIDIOC_DECODER_CMD}, struct v4l2_decoder_cmd *argp)
```

```c
int ioctl(int fd, \texttt{VIDIOC_TRY_DECODER_CMD}, struct v4l2_decoder_cmd *argp)
```

#### Arguments

- \texttt{fd} File descriptor returned by \texttt{open}()
- \texttt{argp} pointer to \texttt{struct v4l2_decoder_cmd}

#### Description

These ioctls control an audio/video (usually MPEG-) decoder. \texttt{VIDIOC_DECODER_CMD} sends a command to the decoder, \texttt{VIDIOC_TRY_DECODER_CMD} can be used to try a command without actually executing it. To send a command applications must initialize all fields of a \texttt{struct v4l2_decoder_cmd} and call \texttt{VIDIOC_DECODER_CMD} or \texttt{VIDIOC_TRY_DECODER_CMD} with a pointer to this structure.

The \texttt{cmd} field must contain the command code. Some commands use the \texttt{flags} field for additional information.

A \texttt{write()} or \texttt{ioctl \texttt{VIDIOC_STREAMON, VIDIOC_STREAMOFF}} call sends an implicit START command to the decoder if it has not been started yet.

A \texttt{close()} or \texttt{VIDIOC_STREAMOFF} call of a streaming file descriptor sends an implicit immediate STOP command to the decoder, and all buffered data is discarded.

These ioctls are optional, not all drivers may support them. They were introduced in Linux 3.3.
### Table 1.55: struct v4l2_decoder_cmd

<table>

</tr>
<tr>
<td>__s32</td>
<td>speed</td>
<td>Playback speed and direction. The playback speed is defined as speed/1000 of the normal speed. So 1000 is normal playback. Negative numbers denote reverse playback, so -1000 does reverse playback at normal speed. Speeds -1, 0 and 1 have special meanings: speed 0 is shorthand for 1000 (normal playback). A speed of 1 steps just one frame forward, a speed of -1 steps just one frame back.</td>
</tr>
<tr>
<td>__u32</td>
<td>format</td>
<td>Format restrictions. This field is set by the driver, not the application. Possible values are V4L2_DEC_START_FMT_NONE if there are no format restrictions or V4L2_DEC_START_FMT_GOP if the decoder operates on full GOPs (Group Of Pictures). This is usually the case for reverse playback: the decoder needs full GOPs, which it can then play in reverse order. So to implement reverse playback the application must feed the decoder the last GOP in the video file, then the GOP before that, etc. etc.</td>
</tr>
<tr>
<td>struct</td>
<td>stop</td>
<td>Structure containing additional data for the V4L2_DEC_CMD_STOP command.</td>
</tr>
<tr>
<td>__u64</td>
<td>pts</td>
<td>Stop playback at this pts or immediately if the playback is already past that timestamp. Leave to 0 if you want to stop after the last frame was decoded.</td>
</tr>
<tr>
<td>struct</td>
<td>raw</td>
<td>Reserved for future extensions. Drivers and applications must set the array to zero.</td>
</tr>
</tbody>
</table>
Table 1.56: Decoder Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_DEC_CMD_START</td>
<td>0</td>
<td>Start the decoder. When the decoder is already running or paused, this command will just change the playback speed. That means that calling V4L2_DEC_CMD_START when the decoder was paused will not resume the decoder. You have to explicitly call V4L2_DEC_CMD_RESUME for that. This command has one flag: V4L2_DEC_CMD_START_MUTE_AUDIO. If set, then audio will be muted when playing back at a non-standard speed.</td>
</tr>
<tr>
<td>V4L2_DEC_CMD_STOP</td>
<td>1</td>
<td>Stop the decoder. When the decoder is already stopped, this command does nothing. This command has two flags: if V4L2_DEC_CMD_STOP_TO_BLACK is set, then the decoder will set the picture to black after it stopped decoding. Otherwise the last image will repeat. mem2mem decoders will stop producing new frames altogether. They will send a V4L2_EVENT_EOS event when the last frame has been decoded and all frames are ready to be dequeued and will set the V4L2_BUF_FLAG_LAST buffer flag on the last buffer of the capture queue to indicate there will be no new buffers produced to dequeue. This buffer may be empty, indicated by the driver setting the bytesused field to 0. Once the V4L2_BUF_FLAG_LAST flag was set, the VIDIOC_DQBUF ioctl will not block anymore, but return an EPIPE error code. If V4L2_DEC_CMD_STOP_IMMEDIATELY is set, then the decoder stops immediately (ignoring the pts value), otherwise it will keep decoding until timestamp &gt;= pts or until the last of the pending data from its internal buffers was decoded.</td>
</tr>
<tr>
<td>V4L2_DEC_CMD_PAUSE</td>
<td>2</td>
<td>Pause the decoder. When the decoder has not been started yet, the driver will return an EPERM error code. When the decoder is already paused, this command does nothing. This command has one flag: if V4L2_DEC_CMD_PAUSE_TO_BLACK is set, then set the decoder output to black when paused.</td>
</tr>
<tr>
<td>V4L2_DEC_CMD_RESUME</td>
<td>3</td>
<td>Resume decoding after a PAUSE command. When the decoder has not been started yet, the driver will return an EPERM error code. When the decoder is already running, this command does nothing. No flags are defined for this command.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The cmd field is invalid.

EPERM The application sent a PAUSE or RESUME command when the decoder was not running.

ioctl VIDIOC_DQEVENT

Name

VIDIOC_DQEVENT - Dequeue event

Synopsis

int ioctl(int fd, VIDIOC_DQEVENT, struct v4l2_event *argp)
Arguments

fd File descriptor returned by `open()`.
argp

Description

Dequeue an event from a video device. No input is required for this ioctl. All the fields of the struct `v4l2_event` structure are filled by the driver. The file handle will also receive exceptions which the application may get by e.g. using the select system call.

| V4L2_EVENT_VSYNC | 1 | This event is triggered on the vertical sync. This event has a struct `v4l2_event_vsync` associated with it. |

Continued on next page
<table>
<thead>
<tr>
<th>Event Code</th>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_EVENT_EOS</td>
<td>2</td>
<td>This event is triggered when the end of a stream is reached. This is typically used with MPEG decoders to report to the application when the last of the MPEG stream has been decoded.</td>
</tr>
<tr>
<td>V4L2_EVENT_CTRL</td>
<td>3</td>
<td>This event requires that the id matches the control ID from which you want to receive events. This event is triggered if the control’s value changes, if a button control is pressed or if the control’s flags change. This event has a struct <code>v4l2_event_ctrl</code> associated with it. This struct contains much of the same information as struct <code>v4l2_queryctrl</code> and struct <code>v4l2_control</code>. If the event is generated due to a call to <code>VIDIOC_S_CTRL</code> or <code>VIDIOC_S_EXT_CTRLS</code>, then the event will not be sent to the file handle that called the ioctl function. This prevents nasty feedback loops. If you do want to get the event, then set the <code>V4L2_EVENT_SUB_FL_ALLOW_FEEDBACK</code> flag. This event type will ensure that no information is lost when more events are raised than there is room internally. In that case the struct <code>v4l2_event_ctrl</code> of the second-oldest event is kept, but the changes field of the second-oldest event is ORed with the changes field of the oldest event.</td>
</tr>
<tr>
<td>V4L2_EVENT_FRAME_SYNC</td>
<td>4</td>
<td>Triggered immediately when the reception of a frame has begun. This event has a struct <code>v4l2_event_frame_sync</code> associated with it. If the hardware needs to be stopped in the case of a buffer underrun it might not be able to generate this event. In such cases the <code>frame_sequence</code> field in struct <code>v4l2_event_frame_sync</code> will not be incremented. This causes two consecutive frame sequence numbers to have n times frame interval in between them.</td>
</tr>
<tr>
<td>V4L2_EVENT_SOURCE_CHANGE</td>
<td>5</td>
<td>This event is triggered when a source parameter change is detected during runtime by the video device. It can be a runtime resolution change triggered by a video decoder or the format change happening on an input connector. This event requires that the id matches the input index (when used with a video device node) or the pad index (when used with a subdevice node) from which you want to receive events. This event has a struct <code>v4l2_event_src_change</code> associated with it. The changes bitfield denotes what has changed for the subscribed pad. If multiple events occurred before application could dequeue them, then the changes will have the ORed value of all the events generated.</td>
</tr>
<tr>
<td>V4L2_EVENT_MOTION_DET</td>

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP**

**Name**

VIDIOC_DV_TIMINGS_CAP - VIDIOC_SUBDEV_DV_TIMINGS_CAP - The capabilities of the Digital Video receiver/transmitter

**Synopsis**

```c
int ioctl(int fd, VIDIOC_DV_TIMINGS_CAP, struct v4l2_dv_timings_cap *argp)
int ioctl(int fd, VIDIOC_SUBDEV_DV_TIMINGS_CAP, struct v4l2_dv_timings_cap *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp**

**Description**

To query the capabilities of the DV receiver/transmitter applications initialize the pad field to 0, zero the reserved array of struct `v4l2_dv_timings_cap` and call the VIDIOC_DV_TIMINGS_CAP ioctl on a video node and the driver will fill in the structure.
When implemented by the driver DV capabilities of subdevices can be queried by calling the VID-IOC_SUBDEV_DV_TIMINGS_CAP ioctl directly on a subdevice node. The capabilities are specific to inputs (for DV receivers) or outputs (for DV transmitters), applications must specify the desired pad number in the struct `v4l2_dv_timings_cap` pad field and zero the reserved array. Attempts to query capabilities on a pad that doesn’t support them will return an EINVAL error code.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.
ioctl VIDIOC_ENCODER_CMD, VIDIOC_TRY_ENCODER_CMD

Name

VIDIOC_ENCODER_CMD - VIDIOC_TRY_ENCODER_CMD - Execute an encoder command

Synopsis

```c
int ioctl(int fd, VIDIOC_ENCODER_CMD, struct v4l2_encoder_cmd *argp)
int ioctl(int fd, VIDIOC_TRY_ENCODER_CMD, struct v4l2_encoder_cmd *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp**

Description

These ioctls control an audio/video (usually MPEG-) encoder. VIDIOC_ENCODER_CMD sends a command to the encoder, VIDIOC_TRY_ENCODER_CMD can be used to try a command without actually executing it.

To send a command applications must initialize all fields of a struct `v4l2_encoder_cmd` and call VIDIOC_ENCODER_CMD or VIDIOC_TRY_ENCODER_CMD with a pointer to this structure.

The `cmd` field must contain the command code. The `flags` field is currently only used by the STOP command and contains one bit: If the `V4L2_ENC_CMD_STOP_AT_GOP_END` flag is set, encoding will continue until the end of the current Group Of Pictures, otherwise it will stop immediately.

A `read()` or VIDIOC_STREAMON call sends an implicit START command to the encoder if it has not been started yet. After a STOP command, `read()` calls will read the remaining data buffered by the driver. When the buffer is empty, `read()` will return zero and the next `read()` call will restart the encoder.

A `close()` or VIDIOC_STREAMOFF call of a streaming file descriptor sends an implicit immediate STOP to the encoder, and all buffered data is discarded.

These ioctls are optional, not all drivers may support them. They were introduced in Linux 2.6.21.

| __u32   | cmd     | The encoder command, see Encoder Commands. |
| __u32   | flags   | Flags to go with the command, see Encoder Command Flags. If no flags are defined for this command, drivers and applications must set this field to zero. |
| __u32   | data[8] | Reserved for future extensions. Drivers and applications must set the array to zero. |

<tbody>
<tr>
<td>V4L2_ENC_CMD_STOP_AT_GOP_END</td>
<td>0x0001</td>
<td>Stop encoding at the end of the current Group Of Pictures, rather than immediately.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The cmd field is invalid.
EPERM The application sent a PAUSE or RESUME command when the encoder was not running.

ioctl VIDIOC_ENUMAUDIO

Name

VIDIOC_ENUMAUDIO - Enumerate audio inputs

Synopsis

int ioctl(int fd, VIDIOC_ENUMAUDIO, struct v4l2_audio *argp)
Arguments

*fd*  
File descriptor returned by `open()`.

*argp*

Description

To query the attributes of an audio input applications initialize the `index` field and zero out the reserved array of a struct `v4l2_audio` and call the `ioctl VIDIOC_ENUMAUDIO` ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all audio inputs applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

See `VIDIOC_G_AUDIO` for a description of struct `v4l2_audio`.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

EINVAL  
The number of the audio input is out of bounds.

`ioctl VIDIOC_ENUMAUDOUT`

Name

VIDIOC_ENUMAUDOUT - Enumerate audio outputs

Synopsis

```c
int ioctl(int fd, VIDIOC_ENUMAUDOUT, struct v4l2_audioout *argp)
```

Arguments

*fd*  
File descriptor returned by `open()`.

*argp*

Description

To query the attributes of an audio output applications initialize the `index` field and zero out the reserved array of a struct `v4l2_audioout` and call the VIDIOC_G_AUDOUT ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all audio outputs applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

**Note:**

Connectors on a TV card to loop back the received audio signal to a sound card are not audio outputs in this sense.

See `VIDIOC_G_AUDIOout` for a description of struct `v4l2_audioout`.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The number of the audio output is out of bounds.

ioctl VIDIOC_ENUM_DV_TIMINGS, VIDIOC_SUBDEV_ENUM_DV_TIMINGS

Name

VIDIOC_ENUM_DV_TIMINGS - VIDIOC_SUBDEV_ENUM_DV_TIMINGS - Enumerate supported Digital Video timings

Synopsis

```c
int ioctl(int fd, VIDIOC_ENUM_DV_TIMINGS, struct v4l2_enum_dv_timings *argp)
int ioctl(int fd, VIDIOC_SUBDEV_ENUM_DV_TIMINGS, struct v4l2_enum_dv_timings *argp)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `argp`

Description

While some DV receivers or transmitters support a wide range of timings, others support only a limited number of timings. With this ioctl applications can enumerate a list of known supported timings. Call `ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP` to check if it also supports other standards or even custom timings that are not in this list.

To query the available timings, applications initialize the `index` field, set the `pad` field to 0, zero the reserved array of struct `v4l2_enum_dv_timings` and call the VIDIOC_ENUM_DV_TIMINGS ioctl on a video node with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all supported DV timings, applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

**Note:**

Drivers may enumerate a different set of DV timings after switching the video input or output.

When implemented by the driver DV timings of subdevices can be queried by calling the VIDIOC_SUBDEV_ENUM_DV_TIMINGS ioctl directly on a subdevice node. The DV timings are specific to inputs (for DV receivers) or outputs (for DV transmitters), applications must specify the desired pad number in the struct `v4l2_enum_dv_timings` pad field. Attempts to enumerate timings on a pad that doesn’t support them will return an EINVAL error code.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL  The struct v4l2_fmtdesc type is not supported or the index is out of bounds.
ioctl VIDIOC_ENUM_FRAMESIZES

Name

VIDIOC_ENUM_FRAMESIZES - Enumerate frame sizes

Synopsis

```c
int ioctl(int fd, VIDIOC_ENUM_FRAMESIZES, struct v4l2_frmsizeenum *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to a struct `v4l2_frmsizeenum` that contains an index and pixel format and receives a frame width and height.

Description

This ioctl allows applications to enumerate all frame sizes (i.e. width and height in pixels) that the device supports for the given pixel format.

The supported pixel formats can be obtained by using the `ioctl VIDIOC_ENUM_FMT` function.

The return value and the content of the `v4l2_frmsizeenum.type` field depend on the type of frame sizes the device supports. Here are the semantics of the function for the different cases:

- **Discrete**: The function returns success if the given index value (zero-based) is valid. The application should increase the index by one for each call until EINVAL is returned. The `v4l2_frmsizeenum.type` field is set to V4L2_FRMSIZE_TYPE_DISCRETE by the driver. Of the union only the discrete member is valid.

- **Step-wise**: The function returns success if the given index value is zero and EINVAL for any other index value. The `v4l2_frmsizeenum.type` field is set to V4L2_FRMSIZE_TYPE_STEPWISE by the driver. Of the union only the stepwise member is valid.

- **Continuous**: This is a special case of the step-wise type above. The function returns success if the given index value is zero and EINVAL for any other index value. The `v4l2_frmsizeenum.type` field is set to V4L2_FRMSIZE_TYPE_CONTINUOUS by the driver. Of the union only the stepwise member is valid and the `step_width` and `step_height` values are set to 1.

When the application calls the function with index zero, it must check the type field to determine the type of frame size enumeration the device supports. Only for the V4L2_FRMSIZE_TYPE_DISCRETE type does it make sense to increase the index value to receive more frame sizes.

**Note:**

The order in which the frame sizes are returned has no special meaning. In particular does it not say anything about potential default format sizes.

Applications can assume that the enumeration data does not change without any interaction from the application itself. This means that the enumeration data is consistent if the application does not perform any other ioctl calls while it runs the frame size enumeration.
Structs

In the structs below, \emph{IN} denotes a value that has to be filled in by the application, \emph{OUT} denotes values that the driver fills in. The application should zero out all members except for the \emph{IN} fields.

\texttt{ioctl VIDIOC_ENUM_FRAMEINTERVALS}

Name

VIDIOC_ENUM_FRAMEINTERVALS - Enumerate frame intervals

Synopsis

\begin{verbatim}
int ioctl(int fd, VIDIOC_ENUM_FRAMEINTERVALS, struct v4l2_frmivalenum *argp)
\end{verbatim}
Arguments

- **fd**: File descriptor returned by `open()`.
- **argp**: Pointer to a struct `v4l2_frmivalenum` structure that contains a pixel format and size and receives a frame interval.

Description

This ioctl allows applications to enumerate all frame intervals that the device supports for the given pixel format and frame size.

The supported pixel formats and frame sizes can be obtained by using the `ioctl VIDIOC_ENUM_FMT` and `ioctl VIDIOC_ENUM_FRAMESIZES` functions.

The return value and the content of the `v4l2_frmivalenum.type` field depend on the type of frame intervals the device supports. Here are the semantics of the function for the different cases:

- **Discrete**: The function returns success if the given index value (zero-based) is valid. The application should increase the index by one for each call until `EINVAL` is returned. The `v4l2_frmivalenum.type` field is set to `V4L2_FRMIVAL_TYPE_DISCRETE` by the driver. Of the union only the `discrete` member is valid.
- **Step-wise**: The function returns success if the given index value is zero and `EINVAL` for any other index value. The `v4l2_frmivalenum.type` field is set to `V4L2_FRMIVAL_TYPE_STEPWISE` by the driver. Of the union only the `stepwise` member is valid.
- **Continuous**: This is a special case of the step-wise type above. The function returns success if the given index value is zero and `EINVAL` for any other index value. The `v4l2_frmivalenum.type` field is set to `V4L2_FRMIVAL_TYPE_CONTINUOUS` by the driver. Of the union only the `stepwise` member is valid and the step value is set to 1.

When the application calls the function with index zero, it must check the `type` field to determine the type of frame interval enumeration the device supports. Only for the `V4L2_FRMIVAL_TYPE_DISCRETE` type does it make sense to increase the index value to receive more frame intervals.

**Note:**

The order in which the frame intervals are returned has no special meaning. In particular does it not say anything about potential default frame intervals.

Applications can assume that the enumeration data does not change without any interaction from the application itself. This means that the enumeration data is consistent if the application does not perform any other ioctl calls while it runs the frame interval enumeration.

**Note:**

**Frame intervals and frame rates**: The V4L2 API uses frame intervals instead of frame rates. Given the frame interval the frame rate can be computed as follows:

\[
\text{frame_rate} = \frac{1}{\text{frame_interval}}
\]

Structs

In the structs below, **IN** denotes a value that has to be filled in by the application, **OUT** denotes values that the driver fills in. The application should zero out all members except for the **IN** fields.

ioctl VIDIOC_ENUM_FREQ_BANDS

Name

VIDIOC_ENUM_FREQ_BANDS - Enumerate supported frequency bands

Synopsis

int ioctl(int fd, VIDIOC_ENUM_FREQ_BANDS, struct v4l2_frequency_band *argp)

Arguments

fd File descriptor returned by open().
argp

206 Chapter 1. Linux Media Infrastructure userspace API
**Description**

Enumerates the frequency bands that a tuner or modulator supports. To do this applications initialize the tuner, type and index fields, and zero out the reserved array of a struct `v4l2_frequency_band` and call the `ioctl VIDIOC_ENUM_FREQ_BANDS` ioctl with a pointer to this structure.

This ioctl is supported if the V4L2_TUNER_CAP_FREQ_BANDS capability of the corresponding tuner/modulator is set.
Table 1.82: struct v4l2_frequency_band

| __u32 | tuner | The tuner or modulator index number. This is the same value as in the struct v4l2_input tuner field and the struct v4l2_tuner index field, or the struct v4l2_output modulator field and the struct v4l2_modulator index field. |
| __u32 | type | The tuner type. This is the same value as in the struct v4l2_tuner type field. The type must be set to V4L2_TUNER_RADIO for /dev/radioX device nodes, and to V4L2_TUNER_ANALOG_TV for all others. Set this field to V4L2_TUNER_RADIO for modulators (currently only radio modulators are supported). See enum v4l2_tuner_type |
| __u32 | index | Identifies the frequency band, set by the application. |
| __u32 | capability | The tuner/modulator capability flags for this frequency band, see Tuner and Modulator Capability Flags. The V4L2_TUNER_CAP_LOW or V4L2_TUNER_CAP_1HZ capability must be the same for all frequency bands of the selected tuner/modulator. So either all bands have that capability set, or none of them have that capability. |
| __u32 | rangelow | The lowest tunable frequency in units of 62.5 kHz, or if the capability flag V4L2_TUNER_CAP_LOW is set, in units of 62.5 Hz, for this frequency band. A 1 Hz unit is used when the capability flag V4L2_TUNER_CAP_1HZ is set. |
| __u32 | rangehigh | The highest tunable frequency in units of 62.5 kHz, or if the capability flag V4L2_TUNER_CAP_LOW is set, in units of 62.5 Hz, for this frequency band. A 1 Hz unit is used when the capability flag V4L2_TUNER_CAP_1HZ is set. |
| __u32 | modulation | The supported modulation systems of this frequency band. See Band Modulation Systems. |
| __u32 | reserved[9] | Reserved for future extensions. Applications and drivers must set the array to zero. |

Note:

Currently only one modulation system per frequency band is supported. More work will need to be done if multiple modulation systems are possible. Contact the linux-media mailing list (https://linuxtv.org/lists.php) if you need such functionality.
Table 1.83: Band Modulation Systems

<table>
<thead>
<tr>
<th>V4L2_BAND_MODULATION_VSB</th>
<th>0x02</th>
<th>Vestigial Sideband modulation, used for analog TV.</th>
</tr>
</thead>

<td>Frequency Modulation, commonly used for analog radio.</td>
</tr>
<tr>
<td>V4L2_BAND_MODULATION_AM</td>
<td>0x08</td>
<td>Amplitude Modulation, commonly used for analog radio.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL  The tuner or index is out of bounds or the type field is wrong.

ioctl VIDIOC_ENUMINPUT

Name

VIDIOC_ENUMINPUT - Enumerate video inputs

Synopsis

```c
int ioctl(int fd, VIDIOC_ENUMINPUT, struct v4l2_input *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp**

Description

To query the attributes of a video input applications initialize the index field of struct `v4l2_input` and call the `ioctl VIDIOC_ENUMINPUT` ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all inputs applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

</tr>
</tbody>
</table>

Identifies the input, set by the application.
Name of the video input, a NUL-terminated ASCII string, for example: “Vin (Composite 2)”. This information is intended for the user, preferably the connector label on the device itself.
Type of the input, see `Input Types`.
Drivers can enumerate up to 32 video and audio inputs. This field shows which audio inputs were selectable as audio source if this was the currently selected video input. It is a bit mask. The LSB corresponds to audio input 0, the MSB to input 31. Any number of bits can be set, or none.
When the driver does not enumerate audio inputs no bits must be set. Applications shall not interpret this as lack of audio support. Some drivers automatically select audio sources and do not enumerate them since there is no choice anyway.
For details on audio inputs and how to select the current input see `Audio Inputs and Outputs`.
Capture devices can have zero or more tuners (RF demodulators). When the type is set to V4L2_INPUT_TYPE_TUNER this is an RF connector and this field identifies the tuner. It corresponds to struct `v4l2_tuner` field index. For details on tuners see `Tuners and Modulators`.
Every video input supports one or more different video standards. This field is a set of all supported standards. For details on video standards and how to switch see `Video Standards`.
This field provides status information about the input. See `Input Status Flags` for flags. With the exception of the sensor orientation bits status is only valid when this is the current input.
This field provides capabilities for the input. See `Input capabilities` for flags.
Reserved for future extensions. Drivers must set the array to zero.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**EINVAL** The struct `v4l2_input` index is out of bounds.

**ioctl VIDIOC_ENUMOUTPUT**

**Name**

VIDIOC_ENUMOUTPUT - Enumerate video outputs
Synopsis

int ioctl(int fd, VIDIOC_ENUMOUTPUT, struct v4l2_output *argp)

Arguments

fd File descriptor returned by open().
argp

Description

To query the attributes of a video outputs applications initialize the index field of struct v4l2_output and call the ioctl VIDIOC_ENUMOUTPUT ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all outputs applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

EINVAL The struct v4l2_output index is out of bounds.

ioctl VIDIOC_ENUMSTD

Name

VIDIOC_ENUMSTD - Enumerate supported video standards

Synopsis

int ioctl(int fd, VIDIOC_ENUMSTD, struct v4l2_standard *argp)

Arguments

fd File descriptor returned by open().
argp

Description

To query the attributes of a video standard, especially a custom (driver defined) one, applications initialize the index field of struct v4l2_standard and call the ioctl VIDIOC_ENUMSTD ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all standards applications shall begin at index zero, incrementing by one until the driver returns EINVAL. Drivers may enumerate a different set of standards after switching the video input or output. ¹

¹ The supported standards may overlap and we need an unambiguous set to find the current standard returned by VIDIOC_G_STD.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

- **EINVAL** The struct `v4l2_standard` index is out of bounds.
- **ENODATA** Standard video timings are not supported for this input or output.

### ioctl VIDIOC_EXPBUF

**Name**

VIDIOC_EXPBUF - Export a buffer as a DMABUF file descriptor.

**Synopsis**

```c
int ioctl(int fd, VIDIOC_EXPBUF, struct v4l2_exportbuffer *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp**

**Description**

This ioctl is an extension to the `memory mapping` I/O method, therefore it is available only for `V4L2_MEMORY_MMAP` buffers. It can be used to export a buffer as a DMABUF file at any time after buffers have been allocated with the `ioctl VIDIOC_REQBUFS` ioctl.

To export a buffer, applications fill struct `v4l2_exportbuffer`. The type field is set to the same buffer type as was previously used with struct `v4l2_requestbuffers` type. Applications must also set the index field. Valid index numbers range from zero to the number of buffers allocated with `ioctl VIDIOC_REQBUFS`.

---

216 Chapter 1. Linux Media Infrastructure userspace API
For the multi-planar API, applications set the `plane` field to the index of the plane to be exported. Valid planes range from zero to the maximal number of valid planes for the currently active format. For the single-planar API, applications must set `plane` to zero. Additional flags may be posted in the `flags` field. Refer to a manual for `open()` for details. Currently only `O_CLOEXEC`, `O_RDONLY`, `O_WRONLY`, and `O_RDWR` are supported. All other fields must be set to zero. In the case of multi-planar API, every plane is exported separately using multiple `ioctl VIDIOC_EXPBUF` calls.

After calling `ioctl VIDIOC_EXPBUF` the `fd` field will be set by a driver. This is a DMABUF file descriptor. The application may pass it to other DMABUF-aware devices. Refer to `DMABUF importing` for details about exporting DMABUF files into V4L2 nodes. It is recommended to close a DMABUF file when it is no longer used to allow the associated memory to be reclaimed.

### Examples

```c
int buffer_export(int v4lfd, enum v4l2_buf_type bt, int index, int *dmafd) {
    struct v4l2_exportbuffer expbuf;
    memset(&expbuf, 0, sizeof(expbuf));
    expbuf.type = bt;
    expbuf.index = index;
    if (ioctl(v4lfd, VIDIOC_EXPBUF, &expbuf) == -1) {
        perror("VIDIOC_EXPBUF");
        return -1;
    }
    *dmafd = expbuf.fd;
    return 0;
}

int buffer_export_mp(int v4lfd, enum v4l2_buf_type bt, int index, int dmafd[], int n_planes) {
    int i;
    for (i = 0; i < n_planes; ++i) {
        struct v4l2_exportbuffer expbuf;
        memset(&expbuf, 0, sizeof(expbuf));
        expbuf.type = bt;
        expbuf.index = index;
        expbuf.plane = i;
        if (ioctl(v4lfd, VIDIOC_EXPBUF, &expbuf) == -1) {
            perror("VIDIOC_EXPBUF");
            while (i)
                close(dmafd[--i]);
            return -1;
        }
        dmafd[i] = expbuf.fd;
    }
    return 0;
}
```
Table 1.95: struct v4l2_exportbuffer

| __u32 | type | Type of the buffer, same as struct v4l2_format type or struct v4l2_requestbuffers type, set by the application. See enum v4l2_buf_type |
| __u32 | index | Number of the buffer, set by the application. This field is only used for memory mapping I/O and can range from zero to the number of buffers allocated with the ioctl VIDIOC_REQBUFS and/or ioctl VIDIOC_CREATE_BUFS ioctls. |
| __u32 | plane | Index of the plane to be exported when using the multi-planar API. Otherwise this value must be set to zero. |
| __u32 | flags | Flags for the newly created file, currently only O_CLOEXEC, O_RDONLY, O_WRONLY, and O_RDWR are supported, refer to the manual of open() for more details. |
| __s32 | fd | The DMABUF file descriptor associated with a buffer. Set by the driver. |
| __u32 | reserved[11] | Reserved field for future use. Drivers and applications must set the array to zero. |

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL A queue is not in MMAP mode or DMABUF exporting is not supported or flags or type or index or plane fields are invalid.

ioctl VIDIOC_G_AUDIO, VIDIOC_S_AUDIO

Name

VIDIOC_G_AUDIO - VIDIOC_S_AUDIO - Query or select the current audio input and its attributes

Synopsis

int ioctl(int fd, VIDIOC_G_AUDIO, struct v4l2_audio *argp)
int ioctl(int fd, VIDIOC_S_AUDIO, const struct v4l2_audio *argp)

Arguments

fd File descriptor returned by open().
argp

Description

To query the current audio input applications zero out the reserved array of a struct v4l2_audio and call the VIDIOC_G_AUDIO ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the device has no audio inputs, or none which combine with the current video input.
Audio inputs have one writable property, the audio mode. To select the current audio input and change the audio mode, applications initialize the index and mode fields, and the reserved array of a `struct v4l2_audio` structure and call the `VIDIOC_S_AUDIO` ioctl. Drivers may switch to a different audio mode if the request cannot be satisfied. However, this is a write-only ioctl, it does not return the actual new audio mode.

| __u32 | index | Identifies the audio input, set by the driver or application. |
| __u8  | name[32] | Name of the audio input, a NUL-terminated ASCII string, for example: “Line In”. This information is intended for the user, preferably the connector label on the device itself. |
| __u32 | capability | Audio capability flags, see `Audio Capability Flags`. |
| __u32 | mode | Audio mode flags set by drivers and applications (on `VIDIOC_S_AUDIO` ioctl), see `Audio Mode Flags`. |
| __u32 | reserved[2] | Reserved for future extensions. Drivers and applications must set the array to zero. |

**Table 1.96: struct v4l2_audio**

**Table 1.97: Audio Capability Flags**

| V4L2_AUDCAP_STEREO | 0x00001 | This is a stereo input. The flag is intended to automatically disable stereo recording etc. when the signal is always monaural. The API provides no means to detect if stereo is received, unless the audio input belongs to a tuner. |
| V4L2_AUDCAP_AVL | 0x00002 | Automatic Volume Level mode is supported. |

**Table 1.98: Audio Mode Flags**

| V4L2_AUDMODE_AVL | 0x00001 | AVL mode is on. |

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**EINVAL** No audio inputs combine with the current video input, or the number of the selected audio input is out of bounds or it does not combine.

**ioctl VIDIOC_G_AUDOUT, VIDIOC_S_AUDOUT**

**Name**

VIDIOC_G_AUDOUT - VIDIOC_S_AUDOUT - Query or select the current audio output

**Synopsis**

```c
int ioctl(int fd, VIDIOC_G_AUDOUT, struct v4l2_audioout *argp)
int ioctl(int fd, VIDIOC_S_AUDOUT, const struct v4l2_audioout *argp)
```
Arguments

fd  File descriptor returned by  open  .

argp

Description

To query the current audio output applications zero out the reserved array of a struct  v4l2_audioout  and call the VIDIOC_G_AUDOUT ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the device has no audio inputs, or none which combine with the current video output.

Audio outputs have no writable properties. Nevertheless, to select the current audio output applications can initialize the index field and reserved array (which in the future may contain writable properties) of a  struct v4l2_audioout  structure and call the VIDIOC_S_AUDOUT ioctl. Drivers switch to the requested output or return the EINVAL error code when the index is out of bounds. This is a write-only ioctl, it does not return the current audio output attributes as VIDIOC_G_AUDOUT does.

Note:

Connectors on a TV card to loop back the received audio signal to a sound card are not audio outputs in this sense.

</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the  Generic Error Codes  chapter.

EINVAL No audio outputs combine with the current video output, or the number of the selected audio output is out of bounds or it does not combine.

ioctl VIDIOC_G_CROP, VIDIOC_S_CROP

Name

VIDIOC_G_CROP - VIDIOC_S_CROP - Get or set the current cropping rectangle
Synopsis

```c
int ioctl(int fd, VIDIOC_G_CROP, struct v4l2_crop *argp)

int ioctl(int fd, VIDIOC_S_CROP, const struct v4l2_crop *argp)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `argp`

Description

To query the cropping rectangle size and position applications set the type field of a `struct v4l2_crop` structure to the respective buffer (stream) type and call the `VIDIOC_G_CROP` ioctl with a pointer to this structure. The driver fills the rest of the structure or returns the `EINVAL` error code if cropping is not supported.

To change the cropping rectangle applications initialize the type and `struct v4l2_rect` substructure named `c` of a `v4l2_crop` structure and call the `VIDIOC_S_CROP` ioctl with a pointer to this structure.

Do not use the multiplanar buffer types. Use `V4L2_BUF_TYPE_VIDEO_CAPTURE` instead of `V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE` and use `V4L2_BUF_TYPE_VIDEO_OUTPUT` instead of `V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE`.

The driver first adjusts the requested dimensions against hardware limits, i.e. the bounds given by the capture/output window, and it rounds to the closest possible values of horizontal and vertical offset, width and height. In particular the driver must round the vertical offset of the cropping rectangle to frame lines modulo two, such that the field order cannot be confused.

Second the driver adjusts the image size (the opposite rectangle of the scaling process, source or target depending on the data direction) to the closest size possible while maintaining the current horizontal and vertical scaling factor.

Finally the driver programs the hardware with the actual cropping and image parameters. `VIDIOC_S_CROP` is a write-only ioctl, it does not return the actual parameters. To query them applications must call `VIDIOC_G_CROP` and `ioctl VIDIOC_G_FMT, VIDIOC_S_FMT, VIDIOC_TRY_FMT` . When the parameters are unsuitable the application may modify the cropping or image parameters and repeat the cycle until satisfactory parameters have been negotiated.

When cropping is not supported then no parameters are changed and `VIDIOC_S_CROP` returns the `EINVAL` error code.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.
ioctl VIDIOC_G_CTRL, VIDIOC_S_CTRL

Name

VIDIOC_G_CTRL - VIDIOC_S_CTRL - Get or set the value of a control

Synopsis

```c
int ioctl(int fd, VIDIOC_G_CTRL, struct v4l2_control *argp)
int ioctl(int fd, VIDIOC_S_CTRL, struct v4l2_control *argp)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `argp`

Description

To get the current value of a control applications initialize the `id` field of a struct `struct v4l2_control` and call the `VIDIOC_G_CTRL` ioctl with a pointer to this structure. To change the value of a control applications initialize the `id` and `value` fields of a struct `struct v4l2_control` and call the `VIDIOC_S_CTRL` ioctl.

When the `id` is invalid drivers return an EINVAL error code. When the `value` is out of bounds drivers can choose to take the closest valid value or return an ERANGE error code, whatever seems more appropriate. However, `VIDIOC_S_CTRL` is a write-only ioctl, it does not return the actual new value. If the `value` is inappropriate for the control (e.g. if it refers to an unsupported menu index of a menu control), then EINVAL error code is returned as well.

These ioctls work only with user controls. For other control classes the `VIDIOC_G_EXT_CTRLS`, `VIDIOC_S_EXT_CTRLS` or `VIDIOC_TRY_EXT_CTRLS` must be used.

Table 1.101: struct v4l2_control

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32 id</td>
<td>Identifies the control, set by the application.</td>
</tr>
<tr>
<td>__s32 value</td>
<td>New value or current value.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

- **EINVAL** The struct `v4l2_control` `id` is invalid or the value is inappropriate for the given control (i.e. if a menu item is selected that is not supported by the driver according to `VIDIOC_QUERYMENU`).
- **ERANGE** The struct `v4l2_control` `value` is out of bounds.
- **EBUSY** The control is temporarily not changeable, possibly because another applications took over control of the device function this control belongs to.
- **EACCES** Attempt to set a read-only control or to get a write-only control.
ioctl VIDIOC_G_DV_TIMINGS, VIDIOC_S_DV_TIMINGS

Name

VIDIOC_G_DV_TIMINGS - VIDIOC_S_DV_TIMINGS - VIDIOC_SUBDEV_G_DV_TIMINGS - VIDIOC_SUBDEV_S_DV_TIMINGS - Get or set DV timings for input or output

Synopsis

int ioctl(int fd, VIDIOC_G_DV_TIMINGS, struct v4l2_dv_timings *argp)
int ioctl(int fd, VIDIOC_S_DV_TIMINGS, struct v4l2_dv_timings *argp)
int ioctl(int fd, VIDIOC_SUBDEV_G_DV_TIMINGS, struct v4l2_dv_timings *argp)
int ioctl(int fd, VIDIOC_SUBDEV_S_DV_TIMINGS, struct v4l2_dv_timings *argp)

Arguments

fd  File descriptor returned by  open()  .
argp

Description

To set DV timings for the input or output, applications use the  VIDIOC_S_DV_TIMINGS  ioctl and to get the current timings, applications use the  VIDIOC_G_DV_TIMINGS  ioctl. The detailed timing information is filled in using the structure struct  v4l2_dv_timings . These ioctls take a pointer to the struct  v4l2_dv_timings  structure as argument. If the ioctl is not supported or the timing values are not correct, the driver returns EINVAL error code.

The  linux/v4l2-dv-timings.h  header can be used to get the timings of the formats in the  CEA-861-E  and  VESA DMT  standards. If the current input or output does not support DV timings (e.g. if  ioctl VIDIOC_ENUMINPUT  does not set the  V4L2_IN_CAP_DV_TIMINGS  flag), then ENODATA error code is returned.

Return Value

On success 0 is returned, on error -1 and the  errno  variable is set appropriately. The generic error codes are described at the  Generic Error Codes  chapter.

EINVAL  This ioctl is not supported, or the  VIDIOC_S_DV_TIMINGS  parameter was unsuitable.
ENODATA  Digital video timings are not supported for this input or output.
EBUSY  The device is busy and therefore can not change the timings.

</table>

**ioctl VIDIOC_G_EDID, VIDIOC_S_EDID, VIDIOC_SUBDEV_G_EDID, VIDIOC_SUBDEV_S_EDID**

**Name**

VIDIOC_G_EDID - VIDIOC_S_EDID - VIDIOC_SUBDEV_G_EDID - VIDIOC_SUBDEV_S_EDID - Get or set the EDID of a video receiver/transmitter

**Synopsis**

```c
int ioctl(int fd, VIDIOC_G_EDID, struct v4l2_edid *argp)
int ioctl(int fd, VIDIOC_S_EDID, struct v4l2_edid *argp)
int ioctl(int fd, VIDIOC_SUBDEV_G_EDID, struct v4l2_edid *argp)
```

1.2. Part I - Video for Linux API 225
int ioctl(int fd, VIDIOC_SUBDEV_S_EDID, struct v4l2_edid *argp)

Arguments

**fd** File descriptor returned by `open()`.

**argp**

Description

These ioctls can be used to get or set an EDID associated with an input from a receiver or an output of a transmitter device. They can be used with subdevice nodes (/dev/v4l-subdevX) or with video nodes (/dev/videoX).

When used with video nodes the pad field represents the input (for video capture devices) or output (for video output devices) index as is returned by `ioctl VIDIOC_ENUMINPUT` and `ioctl VIDIOC_ENUMOUTPUT` respectively. When used with subdevice nodes the pad field represents the input or output pad of the subdevice. If there is no EDID support for the given pad value, then the EINVAL error code will be returned.

To get the EDID data the application has to fill in the pad, start_block, blocks and edid fields, zero the reserved array and call `VIDIOC_G_EDID`. The current EDID from block start_block and of size blocks will be placed in the memory edid points to. The edid pointer must point to memory at least blocks * 128 bytes large (the size of one block is 128 bytes).

If there are fewer blocks than specified, then the driver will set blocks to the actual number of blocks. If there are no EDID blocks available at all, then the error code ENODATA is set.

If blocks have to be retrieved from the sink, then this call will block until they have been read.

If start_block and blocks are both set to 0 when `VIDIOC_G_EDID` is called, then the driver will set blocks to the total number of available EDID blocks and it will return 0 without copying any data. This is an easy way to discover how many EDID blocks there are.

**Note:**

*If there are no EDID blocks available at all, then the driver will set blocks to 0 and it returns 0.*

To set the EDID blocks of a receiver the application has to fill in the pad, blocks and edid fields, set start_block to 0 and zero the reserved array. It is not possible to set part of an EDID, it is always all or nothing. Setting the EDID data is only valid for receivers as it makes no sense for a transmitter.

The driver assumes that the full EDID is passed in. If there are more EDID blocks than the hardware can handle then the EDID is not written, but instead the error code E2BIG is set and blocks is set to the maximum that the hardware supports. If start_block is any value other than 0 then the error code EINVAL is set.

To disable an EDID you set blocks to 0. Depending on the hardware this will drive the hotplug pin low and/or block the source from reading the EDID data in some way. In any case, the end result is the same: the EDID is no longer available.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

- **ENODATA** The EDID data is not available.
- **E2BIG** The EDID data you provided is more than the hardware can handle.

**ioctl VIDIOC_G_ENC_INDEX**

**Name**

VIDIOC_G_ENC_INDEX - Get meta data about a compressed video stream

**Synopsis**

```c
int ioctl(int fd, VIDIOC_G_ENC_INDEX, struct v4l2_enc_idx *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp**

**Description**

The `VIDIOC_G_ENC_INDEX` ioctl provides meta data about a compressed video stream the same or another application currently reads from the driver, which is useful for random access into the stream without decoding it.

To read the data applications must call `VIDIOC_G_ENC_INDEX` with a pointer to a struct `v4l2_enc_idx`. On success the driver fills the entry array, stores the number of elements written in the entries field, and initializes the entries_cap field.
Each element of the entry array contains meta data about one picture. A `VIDIOC_G_ENC_INDEX` call reads up to `V4L2_ENC_IDX_ENTRIES` entries from a driver buffer, which can hold up to `entries_cap` entries. This number can be lower or higher than `V4L2_ENC_IDX_ENTRIES`, but not zero. When the application fails to read the meta data in time the oldest entries will be lost. When the buffer is empty or no capturing/encoding is in progress, entries will be zero.

Currently this ioctl is only defined for MPEG-2 program streams and video elementary streams.

`ioctl VIDIOC_G_EXT_CTRLS, VIDIOC_S_EXT_CTRLS, VIDIOC_TRY_EXT_CTRLS`

Name

`VIDIOC_G_EXT_CTRLS` - `VIDIOC_S_EXT_CTRLS` - `VIDIOC_TRY_EXT_CTRLS` - Get or set the value of several controls, try control values
Synopsis

```c
int ioctl(int fd, VIDIOC_G_EXT_CTRLS, struct v4l2_ext_controls *argp)
int ioctl(int fd, VIDIOC_S_EXT_CTRLS, struct v4l2_ext_controls *argp)
int ioctl(int fd, VIDIOC_TRY_EXT_CTRLS, struct v4l2_ext_controls *argp)
```

Arguments

`fd` File descriptor returned by `open()`.
`argp` 

Description

These ioctls allow the caller to get or set multiple controls atomically. Control IDs are grouped into control classes (see Control classes) and all controls in the control array must belong to the same control class.

Applications must always fill in the count, which, controls and reserved fields of struct `v4l2_ext_controls`, and initialize the struct `v4l2_ext_control` array pointed to by the controls fields.

To get the current value of a set of controls applications initialize the `id`, `size` and `reserved2` fields of each struct `v4l2_ext_control` and call the `VIDIOC_G_EXT_CTRLS` ioctl. String controls controls must also set the `string` field. Controls of compound types (`V4L2_CTRL_FLAG_HAS_PAYLOAD` is set) must set the `ptr` field.

If the `size` is too small to receive the control result (only relevant for pointer-type controls like strings), then the driver will set size to a valid value and return an ENOSPC error code. You should re-allocate the memory to this new size and try again. For the string type it is possible that the same issue occurs again if the string has grown in the meantime. It is recommended to call ioctls `VIDIOC_QUERYCTRL`, `VIDIOC_QUERY_EXT_CTRL` and `VIDIOC_QUERYMENU` first and use `maximum+1` as the new `size` value. It is guaranteed that that is sufficient memory.

N-dimensional arrays are set and retrieved row-by-row. You cannot set a partial array, all elements have to be set or retrieved. The total size is calculated as `elems * elem_size`. These values can be obtained by calling `VIDIOC_QUERY_EXT_CTRL`.

To change the value of a set of controls applications initialize the `id`, `size`, `reserved2` and `value/value64/string/ptr` fields of each struct `v4l2_ext_control` and call the `VIDIOC_S_EXT_CTRLS` ioctl. The controls will only be set if all control values are valid.

To check if a set of controls have correct values applications initialize the `id`, `size`, `reserved2` and `value/value64/string/ptr` fields of each struct `v4l2_ext_control` and call the `VIDIOC_TRY_EXT_CTRLS` ioctl. It is up to the driver whether wrong values are automatically adjusted to a valid value or if an error is returned.

When the `id` or which is invalid drivers return an EINVAL error code. When the value is out of bounds drivers can choose to take the closest valid value or return an ERANGE error code, whatever seems more appropriate. In the first case the new value is set in struct `v4l2_ext_control`. If the new control value is inappropriate (e.g. the given menu index is not supported by the menu control), then this will also result in an EINVAL error code error.

The driver will only set/get these controls if all control values are correct. This prevents the situation where only some of the controls were set/get. Only low-level errors (e.g. a failed i2c command) can still cause this situation.

</tr>
</thead>
<tbody>
<tr>
<td>__u32</td>
<td>error_idx</td>
<td>Set by the driver in case of an error. If the error is associated with a particular control, then error_idx is set to the index of that control. If the error is not related to a specific control, or the validation step failed (see below), then error_idx is set to count. The value is undefined if the ioctl returned 0 (success). Before controls are read from/written to hardware a validation step takes place: this checks if all controls in the list are valid controls, if no attempt is made to write to a read-only control or read from a write-only control, and any other up-front checks that can be done without accessing the hardware. The exact validations done during this step are driver dependent since some checks might require hardware access for some devices, thus making it impossible to do those checks up-front. However, drivers should make a best-effort to do as many up-front checks as possible. This check is done to avoid leaving the hardware in an inconsistent state due to easy-to-avoid problems. But it leads to another problem: the application needs to know whether an error came from the validation step (meaning that the hardware was not touched) or from an error during the actual reading from/writing to hardware. The, in hindsight quite poor, solution for that is to set error_idx to count if the validation failed. This has the unfortunate side-effect that it is not possible to see which control failed the validation. If the validation was successful and the error happened while accessing the hardware, then error_idx is less than count and only the controls up to error_idx-1 were read or written correctly, and the state of the remaining controls is undefined. Since VIDIOC_TRY_EXT_CTRLS does not access hardware there is also no need to handle the validation step in this special way, so error_idx will just be set to the control that failed the validation step instead of to count. This means that if VIDIOC_S_EXT_CTRLS fails with error_idx set to count, then you can call VIDIOC_TRY_EXT_CTRLS to try to discover the actual control that failed the validation step. Unfortunately, there is no TRY equivalent for VIDIOC_G_EXT_CTRLS.</td>

</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_ext_control id is invalid, the struct v4l2_ext_controls which is invalid, or the struct v4l2_ext_control value was inappropriate (e.g. the given menu index is not supported by the driver). This error code is also returned by the VIDIOC_S_EXT_CTRLS and VIDIOC_TRY_EXT_CTRLS ioctls if two or more control values are in conflict.

ERANGE The struct v4l2_ext_control value is out of bounds.

EBUSY The control is temporarily not changeable, possibly because another applications took over control of the device function this control belongs to.

ENOSPC The space reserved for the control's payload is insufficient. The field size is set to a value that is enough to store the payload and this error code is returned.

EACCES Attempt to try or set a read-only control or to get a write-only control.
ioctl VIDIOC_G_FBUF, VIDIOC_S_FBUF

Name

VIDIOC_G_FBUF - VIDIOC_S_FBUF - Get or set frame buffer overlay parameters

Synopsis

```c
int ioctl(int fd, VIDIOC_G_FBUF, struct v4l2_framebuffer *argp)
int ioctl(int fd, VIDIOC_S_FBUF, const struct v4l2_framebuffer *argp)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `argp`

Description

Applications can use the `VIDIOC_G_FBUF` and `VIDIOC_S_FBUF` ioctl to get and set the framebuffer parameters for a Video Overlay or Video Output Overlay (OSD). The type of overlay is implied by the device type (capture or output device) and can be determined with the `ioctlVIDIOC_QUERYCAP` ioctl. One /dev/videoN device must not support both kinds of overlay.

The V4L2 API distinguishes destructive and non-destructive overlays. A destructive overlay copies captured video images into the video memory of a graphics card. A non-destructive overlay blends video images into a VGA signal or graphics into a video signal. Video Output Overlays are always non-destructive.

To get the current parameters applications call the `VIDIOC_G_FBUF` ioctl with a pointer to a `struct v4l2_framebuffer` structure. The driver fills all fields of the structure or returns an EINVAL error code when overlays are not supported.

To set the parameters for a Video Output Overlay, applications must initialize the `flags` field of a `struct v4l2_framebuffer`. Since the framebuffer is implemented on the TV card all other parameters are determined by the driver. When an application calls `VIDIOC_S_FBUF` with a pointer to this structure, the driver prepares for the overlay and returns the framebuffer parameters as `VIDIOC_G_FBUF` does, or it returns an error code.

To set the parameters for a non-destructive Video Overlay, applications must initialize the `flags` field, the `fmt` substructure, and call `VIDIOC_S_FBUF`. Again the driver prepares for the overlay and returns the framebuffer parameters as `VIDIOC_G_FBUF` does, or it returns an error code.

For a destructive Video Overlay applications must additionally provide a base address. Setting up a DMA to a random memory location can jeopardize the system security, its stability or even damage the hardware, therefore only the superuser can set the parameters for a destructive video overlay.

### Table 1.14 - continued from previous page

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| void *| base   | Physical base address of the framebuffer, that is the address of the pixel in the top left corner of the framebuffer. This field is irrelevant to non-destructive Video Overlays. For destructive Video Overlays applications must provide a base address. The driver may accept only base addresses which are a multiple of two, four or eight bytes. For Video Output Overlays the driver must return a valid base address, so applications can find the corresponding Linux framebuffer device (see Video Output Overlay Interface).

| struct fmt | layout of the frame buffer.                                                                                     |                                                                                         |
| __u32 width | width of the frame buffer in pixels.                                                                                     |                                                                                         |
| __u32 height | height of the frame buffer in pixels.                                                                                     |                                                                                         |
| __u32 pixelformat | pixel format of the frame buffer. For non-destructive Video Overlays this field only defines a format for the struct v4l2_window chromakey field. For destructive Video Overlays applications must initialize this field. For Video Output Overlays the driver must return a valid format. Usually this is an RGB format (for example V4L2_PIX_FMT_RGB565) but YUV formats (only packed YUV formats when chroma keying is used, not including V4L2_PIX_FMT_UYVY and V4L2_PIX_FMT_UVYV) and the V4L2_PIX_FMT_PAL8 format are also permitted. The behavior of the driver when an application requests a compressed format is undefined. See Image Formats for information on pixel formats.                                                                                         |
| enum v4l2_field | field                                                                 | Drivers and applications shall ignore this field. If applicable, the field order is selected with the VIDIOC_S_FMT ioctl, using the field field of struct v4l2_window.                                                                                         |
| __u32 bytesperline | distance in bytes between the leftmost pixels in two adjacent lines.                                                                                         | Continued on next page
This field is irrelevant to \textit{non-destructive Video Overlays}.

For \textit{destructive Video Overlays} both applications and drivers can set this field to request padding bytes at the end of each line. Drivers however may ignore the requested value, returning width times bytes-per-pixel or a larger value required by the hardware. That implies applications can just set this field to zero to get a reasonable default.

For \textit{Video Output Overlays} the driver must return a valid value.

Video hardware may access padding bytes, therefore they must reside in accessible memory. Consider for example the case where padding bytes after the last line of an image cross a system page boundary. Capture devices may write padding bytes, the value is undefined. Output devices ignore the contents of padding bytes.

When the image format is planar the \texttt{bytesperline} value applies to the first plane and is divided by the same factor as the width field for the other planes. For example the \texttt{Cb} and \texttt{Cr} planes of a YUV 4:2:0 image have half as many padding bytes following each line as the Y plane. To avoid ambiguities drivers must return a \texttt{bytesperline} value rounded up to a multiple of the scale factor.

\begin{table}[h]
\begin{tabular}{|c|c|c|}
\hline
\texttt{__u32} & \texttt{sizeimage} & This field is irrelevant to \textit{non-destructive Video Overlays}. For \textit{destructive Video Overlays} applications must initialize this field. For \textit{Video Output Overlays} the driver must return a valid format. Together with \texttt{base} it defines the frame-buffer memory accessible by the driver. \\
\hline
\texttt{enum} & \texttt{v4l2_colorspace} & This information supplements the \texttt{pixelformat} and must be set by the driver, see \texttt{Colorspaces}. \\
\hline
\texttt{__u32} & \texttt{priv} & Reserved. Drivers and applications must set this field to zero. \\
\hline
\end{tabular}
\end{table}

\footnote{A physical base address may not suit all platforms. GK notes in theory we should pass something like PCI device + memory region + offset instead. If you encounter problems please discuss on the linux-media mailing list: \url{https://linuxtv.org/lists.php}.}

<td>0x0020</td>
<td>Like V4L2_FBUF_FLAG_LOCAL_ALPHA, use the alpha channel of the framebuffer to clip or blend framebuffer pixels with video images, but with an inverted alpha value. The blend function is: output = framebuffer pixel * (1 - alpha) + video pixel * alpha. The actual alpha depth depends on the framebuffer pixel format.</td>
</tr>
<tr>
<td><strong>V4L2_FBUF_FLAG_SRC_CHROMAKEY</strong></td>
<td>0x0040</td>
<td>Use source chroma-keying. The source chromakey color is determined by the chromakey field of struct v4l2_window and negotiated with the VIDIOC_S_FMT ioctl, see VideoOverlayInterface and VideoOutputOverlayInterface. Both chroma-keying are mutual exclusive to each other, so same chromakey field of struct v4l2_window is being used.</td>
</tr>
</tbody>
</table>

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**EPERM** VIDIOC_S_FBUF can only be called by a privileged user to negotiate the parameters for a destructive overlay.

**EINVAL** The VIDIOC_S_FBUF parameters are unsuitable.

**ioctl** VIDIOC_G_FMT, VIDIOC_S_FMT, VIDIOC_TRY_FMT

**Name**

VIDIOC_G_FMT - VIDIOC_S_FMT - VIDIOC_TRY_FMT - Get or set the data format, try a format
Synopsis

```c
int ioctl(int fd, VIDIOC_G_FMT, struct v4l2_format *argp)
int ioctl(int fd, VIDIOC_S_FMT, struct v4l2_format *argp)
int ioctl(int fd, VIDIOC_TRY_FMT, struct v4l2_format *argp)
```

Arguments

*fd*  File descriptor returned by `open()`.

*argp*

Description

These ioctls are used to negotiate the format of data (typically image format) exchanged between driver and application.

To query the current parameters applications set the `type` field of a struct `struct v4l2_format` to the respective buffer (stream) type. For example video capture devices use `V4L2_BUF_TYPE_VIDEO_CAPTURE` or `V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE`. When the application calls the `VIDIOC_G_FMT` ioctl with a pointer to this structure the driver fills the respective member of the `fmt` union. In case of video capture devices that is either the `v4l2_pix_format` `pix` or the struct `v4l2_pix_format_mplane` `pix_mp` member. When the requested buffer type is not supported drivers return an `EINVAL` error code.

To change the current format parameters applications initialize the `type` field and all fields of the respective `fmt` union member. For details see the documentation of the various devices types in `Interfaces`. Good practice is to query the current parameters first, and to modify only those parameters not suitable for the application. When the application calls the `VIDIOC_S_FMT` ioctl with a pointer to a `struct v4l2_format` structure the driver checks and adjusts the parameters against hardware abilities. Drivers should not return an error code unless the `type` field is invalid, this is a mechanism to fathom device capabilities and to approach parameters acceptable for both the application and driver. On success the driver may program the hardware, allocate resources and generally prepare for data exchange. Finally the `VIDIOC_S_FMT` ioctl returns the current format parameters as `VIDIOC_G_FMT` does. Very simple, inflexible devices may even ignore all input and always return the default parameters. However all V4L2 devices exchanging data with the application must implement the `VIDIOC_G_FMT` and `VIDIOC_S_FMT` ioctl. When the requested buffer type is not supported drivers return an `EINVAL` error code on a `VIDIOC_S_FMT` attempt. When I/O is already in progress or the resource is not available for other reasons drivers return the `EBUSY` error code.

The `VIDIOC_TRY_FMT` ioctl is equivalent to `VIDIOC_S_FMT` with one exception: it does not change driver state. It can also be called at any time, never returning `EBUSY`. This function is provided to negotiate parameters, to learn about hardware limitations, without disabling I/O or possibly time consuming hardware preparations. Although strongly recommended drivers are not required to implement this ioctl.

The format as returned by `VIDIOC_TRY_FMT` must be identical to what `VIDIOC_S_FMT` returns for the same input or output.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_format type field is invalid or the requested buffer type not supported.

ioctl VIDIOC_G_FREQUENCY, VIDIOC_S_FREQUENCY

Name

VIDIOC_G_FREQUENCY - VIDIOC_S_FREQUENCY - Get or set tuner or modulator radio frequency

Synopsis

int ioctl(int fd, VIDIOC_G_FREQUENCY, struct v4l2_frequency *argp)
int ioctl(int fd, VIDIOC_S_FREQUENCY, const struct v4l2_frequency *argp)

Arguments

fd File descriptor returned by open().
argp

Description

To get the current tuner or modulator radio frequency applications set the tuner field of a struct v4l2_frequency to the respective tuner or modulator number (only input devices have tuners, only output devices have modulators), zero out the reserved array and call the VIDIOC_G_FREQUENCY ioctl with a pointer to this structure. The driver stores the current frequency in the frequency field.
To change the current tuner or modulator radio frequency applications initialize the tuner, type and frequency fields, and the reserved array of a struct `v4l2_frequency` and call the `VIDIOC_S_FREQUENCY` ioctl with a pointer to this structure. When the requested frequency is not possible the driver assumes the closest possible value. However `VIDIOC_S_FREQUENCY` is a write-only ioctl, it does not return the actual new frequency.

### Table 1.118: struct v4l2_frequency

<table>
<thead>
<tr>
<th>__u32</th>
<th>tuner</th>
<th>The tuner or modulator index number. This is the same value as in the struct <code>v4l2_input</code> tuner field and the struct <code>v4l2_tuner</code> index field, or the struct <code>v4l2_output</code> modulator field and the struct <code>v4l2_modulator</code> index field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32</td>
<td>type</td>
<td>The tuner type. This is the same value as in the struct <code>v4l2_tuner</code> type field. The type must be set to V4L2_TUNER_RADIO for /dev/radioX device nodes, and to V4L2_TUNER_ANALOG_TV for all others. Set this field to V4L2_TUNER_RADIO for modulators (currently only radio modulators are supported). See enum v4l2_tuner_type</td>

<td>frequency</td>
<td>Tuning frequency in units of 62.5 kHz, or if the struct <code>v4l2_tuner</code> or struct <code>v4l2_modulator</code> capability flag V4L2_TUNER_CAP_LOW is set, in units of 62.5 Hz. A 1 Hz unit is used when the capability flag V4L2_TUNER_CAP_1HZ is set.</td>
</tr>
<tr>
<td>__u32</td>
<td>reserved[8]</td>
<td>Reserved for future extensions. Drivers and applications must set the array to zero.</td>
</tr>
</tbody>
</table>

### Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**EINVAL** The tuner index is out of bounds or the value in the type field is wrong.

**EBUSY** A hardware seek is in progress.

### ioctl VIDIOC_G_INPUT, VIDIOC_S_INPUT

**Name**

VIDIOC_G_INPUT - VIDIOC_S_INPUT - Query or select the current video input

**Synopsis**

```c
int ioctl(int fd, VIDIOC_G_INPUT, int *argp)
int ioctl(int fd, VIDIOC_S_INPUT, int *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp`

1.2. Part I - Video for Linux API
Description

To query the current video input applications call the `VIDIOC_G_INPUT` ioctl with a pointer to an integer where the driver stores the number of the input, as in the struct `v4l2_input` index field. This ioctl will fail only when there are no video inputs, returning EINVAL.

To select a video input applications store the number of the desired input in an integer and call the `VIDIOC_S_INPUT` ioctl with a pointer to this integer. Side effects are possible. For example inputs may support different video standards, so the driver may implicitly switch the current standard. Because of these possible side effects applications must select an input before querying or negotiating any other parameters.

Information about video inputs is available using the `ioctl VIDIOC_ENUMINPUT` ioctl.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

EINVAL The number of the video input is out of bounds.

`ioctl VIDIOC_G_JPEGCOMP, VIDIOC_S_JPEGCOMP`

Name

VIDIOC_G_JPEGCOMP - VIDIOC_S_JPEGCOMP

Synopsis

int `ioctl`(int `fd`, `VIDIOC_G_JPEGCOMP`, `v4l2_jpegcompression *argp`)

int `ioctl`(int `fd`, `VIDIOC_S_JPEGCOMP`, const `v4l2_jpegcompression *argp`)

Arguments

`fd` File descriptor returned by `open()`.

`argp`

Description

These ioctl are deprecated. New drivers and applications should use `JPEG class controls` for image quality and JPEG markers control.

[to do]

Ronald Bultje elaborates:

APP is some application-specific information. The application can set it itself, and it’ll be stored in the JPEG-encoded fields (eg; interlacing information for in an AVI or so). COM is the same, but it’s comments, like ‘encoded by me’ or so.

jpeg_markers describes whether the huffman tables, quantization tables and the restart interval information (all JPEG-specific stuff) should be stored in the JPEG-encoded fields. These define how the JPEG field is encoded. If you omit them, applications assume you’ve used standard encoding. You usually do want to add them.

Return Value

On success 0 is returned, on error -1 and the \texttt{errno} variable is set appropriately. The generic error codes are described at the \texttt{Generic Error Codes} chapter.

\texttt{ioctl} \texttt{VIDIOC\_G\_MODULATOR}, \texttt{VIDIOC\_S\_MODULATOR}

Name

\texttt{VIDIOC\_G\_MODULATOR} - \texttt{VIDIOC\_S\_MODULATOR} - Get or set modulator attributes

Synopsis

\begin{verbatim}
int ioctl(int fd, VIDIOC\_G\_MODULATOR, struct v4l2\_modulator \*argp)
int ioctl(int fd, VIDIOC\_S\_MODULATOR, const struct v4l2\_modulator \*argp)
\end{verbatim}

Arguments

\texttt{fd} File descriptor returned by \texttt{open()} .

\texttt{argp} \n
Description

To query the attributes of a modulator applications initialize the \texttt{index} field and zero out the reserved array of a struct \texttt{v4l2\_modulator} and call the \texttt{VIDIOC\_G\_MODULATOR} \texttt{ioctl} with a pointer to this structure. Drivers fill the rest of the structure or return an \texttt{EINVAL} error code when the index is out of bounds. To enumerate all modulators applications shall begin at index zero, incrementing by one until the driver returns \texttt{EINVAL}.

Modulators have two writable properties, an audio modulation set and the radio frequency. To change the modulated audio subprograms, applications initialize the index and \texttt{txsubchans} fields and the reserved
array and call the `VIDIOC_S_MODULATOR` ioctl. Drivers may choose a different audio modulation if the request cannot be satisfied. However this is a write-only ioctl, it does not return the actual audio modulation selected.

SDR specific modulator types are V4L2_TUNER_SDR and V4L2_TUNER_RF. For SDR devices `txsubchans` field must be initialized to zero. The term ‘modulator’ means SDR transmitter in this context.

To change the radio frequency the `VIDIOC_S_FREQUENCY` ioctl is available.

</tr>
<tr>
<td>_u32</td>
<td>reserved[3]</td>
<td>Reserved for future extensions. Drivers and applications must set the array to zero.</td>
</tr>
</tbody>
</table>

Note:
The tuner `rxsubchans` flags are reused, but the semantics are different. Video output devices are assumed to have an analog or PCM audio input with 1-3 channels. The `txsubchans` flags select one or more channels for modulation, together with some audio subprogram indicator, for example, a stereo pilot tone.
Table 1.122: Modulator Audio Transmission Flags

<table>

When the input has three channels the mono track is a down-mix of channel 1 and 2. When combined with V4L2_TUNER_SUB_STEREO channel 1 and 2 are encoded as left and right stereo audio, channel 3 as Second Audio Program. When the input has only two channels, the first is encoded as left and right channel and the second as SAP. When the input has only one channel it is used for all audio tracks. It is not possible to encode a Second Audio Program only. This flag must combine with V4L2_TUNER_SUB_MONO or V4L2_TUNER_SUB_STEREO. If the hardware does not support the respective audio matrix, or the current video standard does not permit SAP the VIDIOC_S_MODULATOR ioctl shall return an EINVAL error code and driver shall fall back to mono or stereo mode.</td>
</tr>
<tr>
<td>V4L2_TUNER_SUB_RDS</td>
<td>0x0010</td>
<td>Enable the RDS encoder for a radio FM transmitter.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.
EINVAL  The struct  `v4l2_modulator`  index is out of bounds.

ioctl VIDIOC_G_OUTPUT, VIDIOC_S_OUTPUT

Name

VIDIOC_G_OUTPUT - VIDIOC_S_OUTPUT - Query or select the current video output

Synopsis

```c
int ioctl(int fd, VIDIOC_G_OUTPUT, int *argp)
int ioctl(int fd, VIDIOC_S_OUTPUT, int *argp)
```

Arguments

- `fd` File descriptor returned by  `open()`.
- `argp`  

Description

To query the current video output applications call the  `VIDIOC_G_OUTPUT`  ioctl with a pointer to an integer where the driver stores the number of the output, as in the struct  `v4l2_output`  index field. This ioctl will fail only when there are no video outputs, returning the EINVAL error code.

To select a video output applications store the number of the desired output in an integer and call the  `VIDIOC_S_OUTPUT`  ioctl with a pointer to this integer. Side effects are possible. For example outputs may support different video standards, so the driver may implicitly switch the current standard. Because of these possible side effects applications must select an output before querying or negotiating any other parameters.

Information about video outputs is available using the  `ioctl VIDIOC_ENUMOUTPUT`  ioctl.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the  `Generic Error Codes` chapter.

EINVAL  The number of the video output is out of bounds, or there are no video outputs at all.

ioctl VIDIOC_G_PARM, VIDIOC_S_PARM

Name

VIDIOC_G_PARM - VIDIOC_S_PARM - Get or set streaming parameters

Synopsis

```c
int ioctl(int fd, VIDIOC_G_PARM, v4l2_streamparm *argp)
int ioctl(int fd, VIDIOC_S_PARM, v4l2_streamparm *argp)
```
Arguments

fd File descriptor returned by `open()`.

argp

Description

The current video standard determines a nominal number of frames per second. If less than this number of frames is to be captured or output, applications can request frame skipping or duplicating on the driver side. This is especially useful when using the `read()` or `write()` functions, which are not augmented by timestamps or sequence counters, and to avoid unnecessary data copying.

Further these ioctl's can be used to determine the number of buffers used internally by a driver in read/write mode. For implications see the section discussing the `read()` function.

To get and set the streaming parameters applications call the `VIDIOC_G_PARM` and `VIDIOC_S_PARM` ioctl, respectively. They take a pointer to a struct `struct v4l2_streamparm` which contains a union holding separate parameters for input and output devices.

<table>
<thead>
<tr>

<table>
<thead>
<tr>
<th>V4L2_MODE_HIGHQUALITY</th>
<th>0x0001</th>
</tr>
</thead>
</table>

High quality imaging mode. High quality mode is intended for still imaging applications. The idea is to get the best possible image quality that the hardware can deliver. It is not defined how the driver writer may achieve that; it will depend on the hardware and the ingenuity of the driver writer. High quality mode is a different mode from the regular motion video capture modes. In high quality mode:

- The driver may be able to capture higher resolutions than for motion capture.
- The driver may support fewer pixel formats than motion capture (eg; true color).
- The driver may capture and arithmetically combine multiple successive fields or frames to remove color edge artifacts and reduce the noise in the video data.
- The driver may capture images in slices like a scanner in order to handle larger format images than would otherwise be possible.
- An image capture operation may be significantly slower than motion capture.
- Moving objects in the image might have excessive motion blur.
- Capture might only work through the `read()` call.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**ioctl VIDIOC_G_PRIORITY, VIDIOC_S_PRIORITY**

**Name**

VIDIOC_G_PRIORITY - VIDIOC_S_PRIORITY - Query or request the access priority associated with a file descriptor

**Synopsis**

```c
int ioctl(int fd, VIDIOC_G_PRIORITY, enum v4l2_priority *argp)
int ioctl(int fd, VIDIOC_S_PRIORITY, const enum v4l2_priority *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp` Pointer to an enum `v4l2_priority` type.
Description

To query the current access priority applications call the `VIDIOC_G_PRIORITY` ioctl with a pointer to an enum `v4l2_priority` variable where the driver stores the current priority.

To request an access priority applications store the desired priority in an enum `v4l2_priority` variable and call `VIDIOC_S_PRIORITY` ioctl with a pointer to this variable.

<table>
<thead>
<tr>
<th>enum <code>v4l2_priority</code></th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_PRIORITY_UNSET</td>
<td>0</td>
<td>Lowest priority, usually applications running in background, for example monitoring VBI transmissions. A proxy application running in user space will be necessary if multiple applications want to read from a device at this priority.</td>
</tr>
<tr>
<td>V4L2_PRIORITY_BACKGROUND</td>
<td>1</td>
<td>Medium priority, usually applications started and interactively controlled by the user. For example TV viewers, Teletext browsers, or just “panel” applications to change the channel or video controls. This is the default priority unless an application requests another.</td>
</tr>
<tr>
<td>V4L2_PRIORITY_INTERACTIVE</td>
<td>2</td>
<td>Highest priority. Only one file descriptor can have this priority, it blocks any other fd from changing device properties. Usually applications which must not be interrupted, like video recording.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

- `EINVAL` The requested priority value is invalid.
- `EBUSY` Another application already requested higher priority.

`ioctl VIDIOC_G_SELECTION, VIDIOC_S_SELECTION`

Name

`VIDIOC_G_SELECTION` - `VIDIOC_S_SELECTION` - Get or set one of the selection rectangles

Synopsis

```c
int ioctl(int fd, VIDIOC_G_SELECTION, struct v4l2_selection *argp)
int ioctl(int fd, VIDIOC_S_SELECTION, struct v4l2_selection *argp)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `request` `VIDIOC_G_SELECTION`, `VIDIOC_S_SELECTION`
- `argp`
Description

The ioctls are used to query and configure selection rectangles.

To query the cropping (composing) rectangle set struct `v4l2_selection` type field to the respective buffer type. Do not use the multiplanar buffer types. Use `V4L2_BUF_TYPE_VIDEO_CAPTURE` instead of `V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE` and use `V4L2_BUF_TYPE_VIDEO_OUTPUT` instead of `V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE`. The next step is setting the value of struct `v4l2_selection` target field to `V4L2_SEL_TGT_CROP` (V4L2_SEL_TGT_COMPOSE). Please refer to table `Common selection definitions` or API for cropping, composing and scaling for additional targets. The flags and reserved fields of struct `v4l2_selection` are ignored and they must be filled with zeros. The driver fills the rest of the structure or returns EINVAL error code if incorrect buffer type or target was used. If cropping (composing) is not supported then the active rectangle is not mutable and it is always equal to the bounds rectangle. Finally, the struct `v4l2_rect` rectangle is filled with the current cropping (composing) coordinates. The coordinates are expressed in driver-dependent units. The only exception are rectangles for images in raw formats, whose coordinates are always expressed in pixels.

To change the cropping (composing) rectangle set the struct `v4l2_selection` type field to the respective buffer type. Do not use multiplanar buffers. Use `V4L2_BUF_TYPE_VIDEO_CAPTURE` instead of `V4L2_BUF_TYPE_VIDEO_CAPTURE_MPLANE`. Use `V4L2_BUF_TYPE_VIDEO_OUTPUT` instead of `V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE`. The next step is setting the value of struct `v4l2_selection` target to `V4L2_SEL_TGT_CROP` (V4L2_SEL_TGT_COMPOSE). Please refer to table `Common selection definitions` or API for cropping, composing and scaling for additional targets. The struct `v4l2_rect` rectangle need to be set to the desired active area. Field struct `v4l2_selection` reserved is ignored and must be filled with zeros. The driver may adjust coordinates of the requested rectangle. An application may introduce constraints to control rounding behaviour. The struct `v4l2_selection` flags field must be set to one of the following:

- 0  - The driver can adjust the rectangle size freely and shall choose a crop/compose rectangle as close as possible to the requested one.
- V4L2_SEL_FLAG_GE - The driver is not allowed to shrink the rectangle. The original rectangle must lay inside the adjusted one.
- V4L2_SEL_FLAG_LE - The driver is not allowed to enlarge the rectangle. The adjusted rectangle must lay inside the original one.
- V4L2_SEL_FLAG_GE | V4L2_SEL_FLAG_LE - The driver must choose the size exactly the same as in the requested rectangle.

Please refer to `Size adjustments with constraint flags`.

The driver may have to adjust the requested dimensions against hardware limits and other parts as the pipeline, i.e. the bounds given by the capture/output window or TV display. The closest possible values of horizontal and vertical offset and sizes are chosen according to following priority:

1. Satisfy constraints from struct `v4l2_selection` flags.
2. Adjust width, height, left, and top to hardware limits and alignments.
3. Keep center of adjusted rectangle as close as possible to the original one.
4. Keep width and height as close as possible to original ones.
5. Keep horizontal and vertical offset as close as possible to original ones.

On success the struct `v4l2_rect` rectangle contains the adjusted rectangle. When the parameters are unsuitable the application may modify the cropping (composing) or image parameters and repeat the cycle until satisfactory parameters have been negotiated. If constraints flags have to be violated at then ERANGE is returned. The error indicates that there exist no rectangle that satisfies the constraints.

Selection targets and flags are documented in `Common selection definitions`.

</table>

Type of the buffer (from enum v4l2_buf_type).
Used to select between cropping and composing rectangles.
Flags controlling the selection rectangle adjustments, refer to selection flags.
The selection rectangle.
Reserved fields for future use. Drivers and applications must zero this array.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL Given buffer type type or the selection target target is not supported, or the flags argument is not valid.
ERANGE It is not possible to adjust struct v4l2_rect r rectangle to satisfy all constraints given in the flags argument.
EBUSY It is not possible to apply change of the selection rectangle at the moment. Usually because streaming is in progress.

ioctl VIDIOC_G_SLICED_VBI_CAP

Name

VIDIOC_G_SLICED_VBI_CAP - Query sliced VBI capabilities
Synopsis

int ioctl(int fd, VIDIOC_G_SLICED_VBI_CAP, struct v4l2_sliced_vbi_cap *argp)

Arguments

fd File descriptor returned by open.
argp

Description

To find out which data services are supported by a sliced VBI capture or output device, applications initialize the type field of a struct v4l2_sliced_vbi_cap, clear the reserved array and call the VIDIOC_G_SLICED_VBI_CAP ioctl. The driver fills in the remaining fields or returns an EINVAL error code if the sliced VBI API is unsupported or type is invalid.

Note:

The type field was added, and the ioctl changed from read-only to write-read, in Linux 2.6.19.
Table 1.130: struct v4l2_sliced_vbi_cap

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u16 service_set</td>
<td>A set of all data services supported by the driver. Equal to the union of all elements of the service_lines array.</td>
</tr>
</tbody>
</table>

| __u16 service_lines[2][24] | Each element of this array contains a set of data services the hardware can look for or insert into a particular scan line. Data services are defined in *Sliced VBI services*. Array indices map to ITU-R line numbers\(^1\) as follows: |

<table>
<thead>
<tr>
<th>Element</th>
<th>525 line systems</th>
<th>625 line systems</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_lines[0][1]</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>service_lines[0][23]</td>
<td>23</td>
<td>23</td>
</tr>
<tr>
<td>service_lines[1][1]</td>
<td>264</td>
<td>314</td>
</tr>
<tr>
<td>service_lines[1][23]</td>
<td>286</td>
<td>336</td>
</tr>
</tbody>
</table>

The number of VBI lines the hardware can capture or output per frame, or the number of services it can identify on a given line may be limited. For example on PAL line 16 the hardware may be able to look for a VPS or Teletext signal, but not both at the same time. Applications can learn about these limits using the VIDIOC_S_FMT ioctl as described in *Sliced VBI Data Interface*.

Drivers must set service_lines[0][0] and service_lines[1][0] to zero.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The value in the type field is wrong.

ioct1 VIDIOC_G_STD, VIDIOC_S_STD

Name

VIDIOC_G_STD - VIDIOC_S_STD - Query or select the video standard of the current input

Synopsis

int ioctl(int fd, VIDIOC_G_STD, v4l2_std_id *argp)
int ioctl(int fd, VIDIOC_S_STD, const v4l2_std_id *argp)

Arguments

fd File descriptor returned by open().

argp

Description

To query and select the current video standard applications use the VIDIOC_G_STD and VIDIOC_S_STD ioctls which take a pointer to a v4l2_std_id type as argument. VIDIOC_G_STD can return a single flag or a set of flags as in struct v4l2_standard field id. The flags must be unambiguous such that they appear in only one enumerated struct v4l2_standard structure.

VIDIOC_S_STD accepts one or more flags, being a write-only ioctl it does not return the actual new standard as VIDIOC_G_STD does. When no flags are given or the current input does not support the requested standard the driver returns anEINVAL error code. When the standard set is ambiguous drivers may return EINVAL or choose any of the requested standards. If the current input or output does not support standard video timings (e.g. if ioctl VIDIOC_ENUMINPUT does not set the V4L2_IN_CAP_STD flag), then ENODATA error code is returned.

ReturnValue

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The VIDIOC_S_STD parameter was unsuitable.

ENODATA Standard video timings are not supported for this input or output.

ioct1 VIDIOC_G_TUNER, VIDIOC_S_TUNER

Name

VIDIOC_G_TUNER - VIDIOC_S_TUNER - Get or set tuner attributes
Synopsis

int ioctl(int \textit{fd}, VIDIOC_G_TUNER, struct v4l2_tuner *\textit{argp})

int ioctl(int \textit{fd}, VIDIOC_S_TUNER, const struct v4l2_tuner *\textit{argp})

Arguments

\textit{fd} File descriptor returned by \textit{open()}.\argp

Description

To query the attributes of a tuner applications initialize the index field and zero out the reserved array of a struct \textit{v4l2_tuner} and call the VIDIOC_G_TUNER ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code when the index is out of bounds. To enumerate all tuners applications shall begin at index zero, incrementing by one until the driver returns EINVAL.

Tuners have two writable properties, the audio mode and the radio frequency. To change the audio mode, applications initialize the index, audmode and reserved fields and call the VIDIOC_S_TUNER ioctl. This will not change the current tuner, which is determined by the current video input. Drivers may choose a different audio mode if the requested mode is invalid or unsupported. Since this is a write-only ioctl, it does not return the actually selected audio mode.

\textit{SDR} specific tuner types are V4L2_TUNER_SDR and V4L2_TUNER_RF. For SDR devices audmode field must be initialized to zero. The term ‘tuner’ means SDR receiver in this context.

To change the radio frequency the VIDIOC_S_FREQUENCY ioctl is available.

1.2. Part I - Video for Linux API
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct v4l2_tuner index is out of bounds.

ioctl VIDIOC_LOG_STATUS

Name

VIDIOC_LOG_STATUS - Log driver status information

Synopsis

int ioctl(int fd, VIDIOC_LOG_STATUS)

Arguments

fd File descriptor returned by open().

Description

As the video/audio devices become more complicated it becomes harder to debug problems. When this ioctl is called the driver will output the current device status to the kernel log. This is particular useful when dealing with problems like no sound, no video and incorrectly tuned channels. Also many modern devices autodetect video and audio standards and this ioctl will report what the device thinks what the standard is. Mismatches may give an indication where the problem is.

This ioctl is optional and not all drivers support it. It was introduced in Linux 2.6.15.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl VIDIOC_OVERLAY

Name

VIDIOC_OVERLAY - Start or stop video overlay

Synopsis

int ioctl(int fd, VIDIOC_OVERLAY, const int *argp)

Arguments

fd File descriptor returned by open().

argp
**Description**

This ioctl is part of the video overlay I/O method. Applications call `ioctl VIDIOC_OVERLAY` to start or stop the overlay. It takes a pointer to an integer which must be set to zero by the application to stop overlay, to one to start.

Drivers do not support `ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF` or `VIDIOC_STREAMOFF` with V4L2_BUF_TYPE_VIDEO_OVERLAY.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**EINVAL** The overlay parameters have not been set up. See `Video Overlay Interface` for the necessary steps.

**ioctl VIDIOC_PREPARE_BUF**

**Name**

VIDIOC_PREPARE_BUF - Prepare a buffer for I/O

**Synopsis**

```c
int ioctl(int fd, VIDIOC_PREPARE_BUF, struct v4l2_buffer *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp` Description

**Description**

Applications can optionally call the `ioctl VIDIOC_PREPARE_BUF` ioctl to pass ownership of the buffer to the driver before actually enqueuing it, using the `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` ioctl, and to prepare it for future I/O. Such preparations may include cache invalidation or cleaning. Performing them in advance saves time during the actual I/O. In case such cache operations are not required, the application can use one of `V4L2_BUF_FLAG_NO_CACHE_INVALIDATE` and `V4L2_BUF_FLAG_NO_CACHE_CLEAN` flags to skip the respective step.

The `struct v4l2_buffer` structure is specified in `Buffers`.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**EBUSY** File I/O is in progress.

**EINVAL** The buffer type is not supported, or the index is out of bounds, or no buffers have been allocated yet, or the userptr or length are invalid.
ioctl VIDIOC_QBUF, VIDIOC_DQBUF

Name

VIDIOC_QBUF - VIDIOC_DQBUF - Exchange a buffer with the driver

Synopsis

```c
int ioctl(int fd, VIDIOC_QBUF, struct v4l2_buffer *argp)
int ioctl(int fd, VIDIOC_DQBUF, struct v4l2_buffer *argp)
```

Arguments

- **fd** File descriptor returned by `open`.
- **argp**

Description

Applications call the VIDIOC_QBUF ioctl to enqueue an empty (capturing) or filled (output) buffer in the driver’s incoming queue. The semantics depend on the selected I/O method.

To enqueue a buffer applications set the type field of a struct `v4l2_buffer` to the same buffer type as was previously used with struct `v4l2_format` type and struct `v4l2_requestbuffers` type. Applications must also set the index field. Valid index numbers range from zero to the number of buffers allocated with `ioctl VIDIOC_REQBUFS` (struct `v4l2_requestbuffers` count) minus one. The contents of the struct `v4l2_buffer` returned by a `ioctl VIDIOC_QUERYBUF` ioctl will do as well. When the buffer is intended for output (type is `V4L2_BUF_TYPE_VIDEO_OUTPUT`, `V4L2_BUF_TYPE_VIDEO_OUTPUT_MPLANE`, or `V4L2_BUF_TYPE_VBI_OUTPUT`) applications must also initialize the `bytesused` and `timestamp` fields, see Buffers for details. Applications must also set flags to 0. The `reserved2` and reserved fields must be set to 0. When using the multi-planar API, the `m.planes` field must contain a userspace pointer to a filled-in array of struct `v4l2_plane` and the `length` field must be set to the number of elements in that array.

To enqueue a memory mapped buffer applications set the memory field to `V4L2_MEMORY_MMAP`. When `VIDIOC_QBUF` is called with a pointer to this structure the driver sets the `V4L2_BUF_FLAG_MAPPED` and `V4L2_BUF_FLAG_QUEUED` flags in the flags field, or it returns an EINVAL error code.

To enqueue a user pointer buffer applications set the memory field to `V4L2_MEMORY_USERPTR`, the `m.userptr` and `length` members of the passed array of struct `v4l2_plane` have to be used instead. When `VIDIOC_QBUF` is called with a pointer to this structure the driver sets the `V4L2_BUF_FLAG_MAPPED` and `V4L2_BUF_FLAG_QUEUED` flags in the flags field, or it returns an error code. This ioctl locks the memory pages of the buffer in physical memory, they cannot be swapped out to disk. Buffers remain locked until dequeued, until the `VIDIOC_STREAMOFF` or `ioctl VIDIOC_REQBUFS` ioctl is called, or until the device is closed.

To enqueue a DMABUF buffer applications set the memory field to `V4L2_MEMORY_DMABUF` and the `m.fd` field to a file descriptor associated with a DMABUF buffer. When the multi-planar API is used the `m.fd` fields of the passed array of struct `v4l2_plane` have to be used instead. When `VIDIOC_QBUF` is called with a pointer to this structure the driver sets the `V4L2_BUF_FLAG_MAPPED` and `V4L2_BUF_FLAG_QUEUED` flags in the flags field, or it returns an error code. This ioctl locks the buffer. Locking a buffer means passing it to a driver for a hardware access (usually DMA). If an application accesses (reads/writes) a locked buffer then the result is undefined. Buffers remain locked until dequeued, until the `VIDIOC_STREAMOFF` or `ioctl VIDIOC_REQBUFS` ioctl is called, or until the device is closed.
Applications call the VIDIOC_DQBUF ioctl to dequeue a filled (capturing) or displayed (output) buffer from the driver’s outgoing queue. They just set the type, memory and reserved fields of a struct `v4l2_buffer` as above, when VIDIOC_DQBUF is called with a pointer to this structure the driver fills the remaining fields or returns an error code. The driver may also set V4L2_BUF_FLAG_ERROR in the flags field. It indicates a non-critical (recoverable) streaming error. In such case the application may continue as normal, but should be aware that data in the dequeued buffer might be corrupted. When using the multi-planar API, the planes array must be passed in as well.

By default VIDIOC_DQBUF blocks when no buffer is in the outgoing queue. When the O_NONBLOCK flag was given to the `open()` function, VIDIOC_DQBUF returns immediately with an EAGAIN error code when no buffer is available.

The `struct v4l2_buffer` structure is specified in `Buffers`.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

- **EAGAIN** Non-blocking I/O has been selected using O_NONBLOCK and no buffer was in the outgoing queue.
- **EINVAL** The buffer type is not supported, or the index is out of bounds, or no buffers have been allocated yet, or the userptr or length are invalid.
- **EIO** VIDIOC_DQBUF failed due to an internal error. Can also indicate temporary problems like signal loss.

---

```
Note:

The driver might dequeue an (empty) buffer despite returning an error, or even stop capturing. Reusing such buffer may be unsafe though and its details (e.g. index) may not be returned either. It is recommended that drivers indicate recoverable errors by setting the V4L2_BUF_FLAG_ERROR and returning 0 instead. In that case the application should be able to safely reuse the buffer and continue streaming.
```

- **EPIPE** VIDIOC_DQBUF returns this on an empty capture queue for mem2mem codecs if a buffer with the V4L2_BUF_FLAG_LAST was already dequeued and no new buffers are expected to become available.

**ioctl VIDIOC_QUERYBUF**

**Name**

VIDIOC_QUERYBUF - Query the status of a buffer

**Synopsis**

```
int ioctl(int fd, VIDIOC_QUERYBUF, struct v4l2_buffer *argp)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **argp**
**Description**

This ioctl is part of the streaming I/O method. It can be used to query the status of a buffer at any time after buffers have been allocated with the `ioctl VIDIOC_REQBUFS` ioctl.

Applications set the type field of a struct `v4l2_buffer` to the same buffer type as was previously used with struct `v4l2_format` type and struct `v4l2_requestbuffers` type, and the index field. Valid index numbers range from zero to the number of buffers allocated with `ioctl VIDIOC_REQBUFS` (struct `v4l2_requestbuffers` count) minus one. The reserved and reserved2 fields must be set to 0. When using the multi-planar API, the m.planes field must contain a userspace pointer to an array of struct `v4l2_plane` and the length field has to be set to the number of elements in that array. After calling `ioctl VIDIOC_QUERYBUF` with a pointer to this structure drivers return an error code or fill the rest of the structure.

In the flags field the V4L2_BUF_FLAG_MAPPED, V4L2_BUF_FLAG_PREPARED, V4L2_BUF_FLAG_QUEUED and V4L2_BUF_FLAG_DONE flags will be valid. The memory field will be set to the current I/O method. For the single-planar API, the m.offset contains the offset of the buffer from the start of the device memory, the length field its size. For the multi-planar API, fields m.mem_offset and length in the m.planes array elements will be used instead and the length field of struct `v4l2_buffer` is set to the number of filled-in array elements. The driver may or may not set the remaining fields and flags, they are meaningless in this context.

The `struct v4l2_buffer` structure is specified in `Buffers`.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**EINVAL** The buffer type is not supported, or the index is out of bounds.

**ioctl VIDIOC_QUERYCAP**

**Name**

VIDIOC_QUERYCAP - Query device capabilities

**Synopsis**

```c
int ioctl(int fd, VIDIOC_QUERYCAP, struct v4l2_capability *argp)
```

**Arguments**

`fd` File descriptor returned by `open()`.

`argp` Structure of type `v4l2_capability`.

**Description**

All V4L2 devices support the VIDIOC_QUERYCAP ioctl. It is used to identify kernel devices compatible with this specification and to obtain information about driver and hardware capabilities. The ioctl takes a pointer to a struct `v4l2_capability` which is filled by the driver. When the driver is not compatible with this specification the ioctl returns an EINVAL error code.
Table 1.138: struct v4l2_capability

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u8</td>
<td>driver[16]</td>
</tr>
<tr>
<td></td>
<td>Name of the driver, a unique NUL-terminated ASCII string. For example: “bttv”. Driver specific applications can use this information to verify the driver identity. It is also useful to work around known bugs, or to identify drivers in error reports. Storing strings in fixed sized arrays is bad practice but unavoidable here. Drivers and applications should take precautions to never read or write beyond the end of the array and to make sure the strings are properly NUL-terminated.</td>
</tr>
<tr>
<td>__u8</td>
<td>card[32]</td>
</tr>
<tr>
<td></td>
<td>Name of the device, a NUL-terminated UTF-8 string. For example: “Yoyo-dyne TV/FM”. One driver may support different brands or models of video hardware. This information is intended for users, for example in a menu of available devices. Since multiple TV cards of the same brand may be installed which are supported by the same driver, this name should be combined with the character device file name (e.g. /dev/video2) or the bus_info string to avoid ambiguities.</td>
</tr>
<tr>
<td>__u8</td>
<td>bus_info[32]</td>
</tr>
<tr>
<td></td>
<td>Location of the device in the system, a NUL-terminated ASCII string. For example: “PCI:0000:05:06.0”. This information is intended for users, to distinguish multiple identical devices. If no such information is available the field must simply count the devices controlled by the driver (“platform:vivi-000”). The bus_info must start with “PCI:” for PCI boards, “PCIe:” for PCI Express boards, “usb:” for USB devices, “I2C:” for i2c devices, “ISA:” for ISA devices, “parport” for parallel port devices and “platform:” for platform devices.</td>
</tr>
<tr>
<td>__u32</td>
<td>version</td>
</tr>
<tr>
<td></td>
<td>Version number of the driver. Starting with kernel 3.1, the version reported is provided by the V4L2 subsystem following the kernel numbering scheme. However, it may not always return the same version as the kernel if, for example, a stable or distribution-modified kernel uses the V4L2 stack from a newer kernel. The version number is formatted using the KERNEL_VERSION() macro:</td>
</tr>
<tr>
<td></td>
<td>#define KERNEL_VERSION(a,b,c) (((a) &lt;&lt; 16) + ((b) &lt;&lt; 8) + (c))</td>
</tr>
<tr>
<td></td>
<td>__u32 version = KERNEL_VERSION(0, 8, 1);</td>
</tr>
<tr>
<td></td>
<td>printf (&quot;Version: %u.%u.%u\n&quot;,</td>
</tr>
<tr>
<td></td>
<td>(version &gt;&gt; 16) &amp; 0xFF, (version &gt;&gt; 8) &amp; 0xFF, version &amp; 0xFF);</td>
</tr>
<tr>
<td>__u32</td>
<td>capabilities</td>
</tr>
<tr>
<td></td>
<td>Available capabilities of the physical device as a whole, see Device Capabilities Flags. The same physical device can export multiple devices in /dev (e.g. /dev/videoX, /dev/vbiY and /dev/radioZ). The capabilities field should contain a union of all capabilities available around the several V4L2 devices exported to userspace. For all those devices the capabilities field returns the same set of capabilities. This allows applications to open just one of the devices (typically the video device) and discover whether video, vbi and/or radio are also supported.</td>
</tr>
<tr>
<td>__u32</td>
<td>device_caps</td>
</tr>
<tr>
<td></td>
<td>Device capabilities of the opened device, see Device Capabilities Flags. Should contain the available capabilities of that specific device node. So, for example, device_caps of a radio device will only contain radio related capabilities and no video or vbi capabilities. This field is only set if the capabilities field contains the V4L2_CAP_DEVICE_CAPS capability. Only the capabilities field can have the V4L2_CAP_DEVICE_CAPS capability, device_caps will never set V4L2_CAP_DEVICE_CAPS.</td>
</tr>
<tr>
<td>__u32</td>
<td>reserved[3]</td>
</tr>
<tr>
<td></td>
<td>Reserved for future extensions. Drivers must set this array to zero.</td>
</tr>

The device supports the single-planar API through the `Video Capture` interface.
The device supports the multi-planar API through the `Video Capture` interface.
The device supports the single-planar API through the `Video Output` interface.
The device supports the multi-planar API through the `Video Output` interface.
The device supports the `Video Overlay` interface.
A video overlay device typically stores captured images directly in the video memory of a graphics card, with hardware clipping and scaling.
The device supports the `Raw VBI Capture` interface, providing Teletext and Closed Caption data.
The device supports the `Raw VBI Output` interface.
The device supports the `Sliced VBI Capture` interface.
The device supports the `Sliced VBI Output` interface.
The device supports the `RDS` capture interface.
The device supports the `Video Overlay Overlay (OSD)` interface. Unlike the `Video Overlay` interface, this is a secondary function of video output devices and overlays an image onto an outgoing video signal. When the driver sets this flag, it must clear the `V4L2_CAP_VIDEO_OUTPUT_OVERLAY` flag and vice versa. 1

The device supports the `ioctl VIDIOC_S_HW_FREQSEEK` ioctl for hardware frequency seeking.
The device supports the `RDS` output interface.
The device has some sort of tuner to receive RF-modulated video signals. For more information about tuner programming see `Tuners and Modulators`.
The device has audio inputs or outputs. It may or may not support audio recording or playback, in PCM or compressed formats. PCM audio support must be implemented as ALSA or OSS interface. For more information on audio inputs and outputs see `Audio Inputs and Outputs`.
This is a radio receiver.
The device has some sort of modulator to emit RF-modulated video/audio signals. For more information about modulator programming see `Tuners and Modulators`.
The device supports the `SDR Capture` interface.
The device supports the struct `v4l2_pix_format` extended fields.

</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the **errno** variable is set appropriately. The generic error codes are described at the **Generic Error Codes** chapter.

**ioctls VIDIOC_QUERYCTRL, VIDIOC_QUERY_EXT_CTRL and VIDIOC_QUERYMENU**

**Name**

VIDIOC_QUERYCTRL - VIDIOC_QUERY_EXT_CTRL - VIDIOC_QUERYMENU - Enumerate controls and menu control items

**Synopsis**

```c
int ioctl(int fd, int VIDIOC_QUERYCTRL, struct v4l2_queryctrl *argp)
int ioctl(int fd, VIDIOC_QUERY_EXT_CTRL, struct v4l2_query_ext_ctrl *argp)
int ioctl(int fd, VIDIOC_QUERYMENU, struct v4l2_querymenu *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp` Description

**Description**

To query the attributes of a control applications set the **id** field of a struct **v4l2_queryctrl** and call the VIDIOC_QUERYCTRL ioctl with a pointer to this structure. The driver fills the rest of the structure or returns an EINVAL error code when the **id** is invalid.

It is possible to enumerate controls by calling VIDIOC_QUERYCTRL with successive **id** values starting from V4L2_CID_BASE up to and exclusive V4L2_CID_LASTP1. Drivers may return EINVAL if a control in this range is not supported. Further applications can enumerate private controls, which are not defined in this specification, by starting at V4L2_CID_PRIVATE_BASE and incrementing **id** until the driver returns EINVAL.

1 The struct **v4l2_framebuffer** lacks an enum **v4l2_buf_type** field, therefore the type of overlay is implied by the driver capabilities.

1.2. Part I - Video for Linux API 269
In both cases, when the driver sets the V4L2_CTRL_FLAG_DISABLED flag in the flags field this control is permanently disabled and should be ignored by the application. ¹

When the application ORs id with V4L2_CTRL_FLAG_NEXT_CTRL the driver returns the next supported non-compound control, or EINVAL if there is none. In addition, the V4L2_CTRL_FLAG_NEXT_COMPOUND flag can be specified to enumerate all compound controls (i.e. controls with type ≥ V4L2_CTRL_COMPOUND_TYPES and/or array control, in other words controls that contain more than one value). Specify both V4L2_CTRL_FLAG_NEXT_CTRL and V4L2_CTRL_FLAG_NEXT_COMPOUND in order to enumerate all controls, compound or not. Drivers which do not support these flags yet always return EINVAL.

The VIDIOC_QUERY_EXT_CTRL ioctl was introduced in order to better support controls that can use compound types, and to expose additional control information that cannot be returned in struct v4l2_queryctrl since that structure is full.

VIDIOC_QUERY_EXT_CTRL is used in the same way as VIDIOC_QUERYCTRL, except that the reserved array must be zeroed as well.

Additional information is required for menu controls: the names of the menu items. To query them applications set the id and index fields of struct v4l2_querymenu and call the VIDIOC_QUERYMENU ioctl with a pointer to this structure. The driver fills the rest of the structure or returns an EINVAL error code when the id or index is invalid. Menu items are enumerated by calling VIDIOC_QUERYMENU with successive index values from struct v4l2_queryctrl minimum to maximum, inclusive.

Note:

It is possible for VIDIOC_QUERYMENU to return an EINVAL error code for some indices between minimum and maximum. In that case that particular menu item is not supported by this driver. Also note that the minimum value is not necessarily 0.

See also the examples in User Controls.

Table 1.140: struct v4l2_queryctrl

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32 id</td>
<td>Identifies the control, set by the application. See Control IDs for predefined IDs. When the ID is ORed with V4L2_CTRL_FLAG_NEXT_CTRL the driver clears the flag and returns the first control with a higher ID. Drivers which do not support this flag yet always return an EINVAL error code.</td>
</tr>
<tr>
<td>__u32 type</td>
<td>Type of control, see enum v4l2_ctrl_type.</td>
</tr>
<tr>
<td>__u8 name[32]</td>
<td>Name of the control, a NUL-terminated ASCII string. This information is intended for the user.</td>
</tr>
<tr>
<td>__s32 minimum</td>
<td>Minimum value, inclusive. This field gives a lower bound for the control. See enum v4l2_ctrl_type how the minimum value is to be used for each possible control type. Note that this a signed 32-bit value.</td>
</tr>
<tr>
<td>__s32 maximum</td>
<td>Maximum value, inclusive. This field gives an upper bound for the control. See enum v4l2_ctrl_type how the maximum value is to be used for each possible control type. Note that this a signed 32-bit value.</td>
</tr>
</tbody>
</table>

¹ V4L2_CTRL_FLAG_DISABLED was intended for two purposes: Drivers can skip predefined controls not supported by the hardware (although returning EINVAL would do as well), or disable predefined and private controls after hardware detection without the trouble of reordering control arrays and indices (EINVAL cannot be used to skip private controls because it would prematurely end the enumeration).
Table 1.140 – continued from previous page

| __s32 | step | This field gives a step size for the control. See enum v4l2_ctrl_type how the step value is to be used for each possible control type. Note that this an unsigned 32-bit value. Generally drivers should not scale hardware control values. It may be necessary for example when the name or id imply a particular unit and the hardware actually accepts only multiples of said unit. If so, drivers must take care values are properly rounded when scaling, such that errors will not accumulate on repeated read-write cycles. This field gives the smallest change of an integer control actually affecting hardware. Often the information is needed when the user can change controls by keyboard or GUI buttons, rather than a slider. When for example a hardware register accepts values 0-511 and the driver reports 0-65535, step should be 128. Note that although signed, the step value is supposed to be always positive. |
| __s32 | default_value | The default value of a V4L2_CTRL_TYPE_INTEGER, _BOOLEAN, _BITMASK, _MENU or _INTEGER_MENU control. Not valid for other types of controls. |
| __u32 | flags | Control flags, see Control Flags. |
| __u32 | reserved[2] | Reserved for future extensions. Drivers must set the array to zero. |

---

Table 1.141: struct v4l2_query_ext_ctrl

| __u32 | id | Identifies the control, set by the application. See Control IDs for predefined IDs. When the ID is ORed with V4L2_CTRL_FLAG_NEXT_CTRL the driver clears the flag and returns the first non-compound control with a higher ID. When the ID is ORed with V4L2_CTRL_FLAG_NEXT_COMPOUND the driver clears the flag and returns the first compound control with a higher ID. Set both to get the first control (compound or not) with a higher ID. |
| __u32 | type | Type of control, see enum v4l2_ctrl_type. |
| char | name[32] | Name of the control, a NUL-terminated ASCII string. This information is intended for the user. |
| __s64 | minimum | Minimum value, inclusive. This field gives a lower bound for the control. See enum v4l2_ctrl_type how the minimum value is to be used for each possible control type. Note that this a signed 64-bit value. |
| __s64 | maximum | Maximum value, inclusive. This field gives an upper bound for the control. See enum v4l2_ctrl_type how the maximum value is to be used for each possible control type. Note that this a signed 64-bit value. |

---

Drivers reset controls to their default value only when the driver is first loaded, never afterwards.

---

Continued on next page
Table 1.141 – continued from previous page

| __u64 | step | This field gives a step size for the control. See enum \texttt{v4l2_ctrl_type} how the step value is to be used for each possible control type. Note that this an unsigned 64-bit value. Generally drivers should not scale hardware control values. It may be necessary for example when the name or id imply a particular unit and the hardware actually accepts only multiples of said unit. If so, drivers must take care values are properly rounded when scaling, such that errors will not accumulate on repeated read-write cycles.
This field gives the smallest change of an integer control actually affecting hardware. Often the information is needed when the user can change controls by keyboard or GUI buttons, rather than a slider. When for example a hardware register accepts values 0-511 and the driver reports 0-65535, step should be 128.
|
| __s64 | default_value | The default value of a \texttt{V4L2_CTRL_TYPE_INTEGER}, \texttt{INTEGER64}, \texttt{BOOLEAN}, \texttt{BITMASK}, \texttt{MENU}, \texttt{INTEGER_MENU}, \_U8 or \_U16 control. Not valid for other types of controls.

\textbf{Note:}

\textit{Drivers reset controls to their default value only when the driver is first loaded, never afterwards.}

| __u32 | flags | Control flags, see \texttt{Control Flags}.
|
| __u32 | elem_size | The size in bytes of a single element of the array. Given a char pointer \texttt{p} to a 3-dimensional array you can find the position of cell \((z,y,x)\) as follows: \(p + ((z \times \text{\texttt{dims}[1]} + y) \times \text{\texttt{dims}[0]} + x) \times \text{\texttt{elem_size}}\). \texttt{elem_size} is always valid, also when the control isn't an array. For string controls \texttt{elem_size} is equal to \texttt{maximum} + 1.
|
| __u32 | elems | The number of elements in the N-dimensional array. If this control is not an array, then \texttt{elems} is 1. The \texttt{elems} field can never be 0.
|
| __u32 | nr_ofDims | The number of dimension in the N-dimensional array. If this control is not an array, then this field is 0.
|
| __u32 | \texttt{dims[V4L2_CTRL_MAX_DIMS]} | The size of each dimension. The first \texttt{nr_of_dims} elements of this array must be non-zero, all remaining elements must be zero.
|
| __u32 | reserved[32] | Reserved for future extensions. Applications and drivers must set the array to zero.

Table 1.142: \texttt{struct v4l2_querymenu}

| __u32 | id | Identifies the control, set by the application from the respective \texttt{struct v4l2_queryctrl id}.
|
| __u32 | index | Index of the menu item, starting at zero, set by the application.
| union |
| __u8 | name[32] | Name of the menu item, a NUL-terminated ASCII string. This information is intended for the user. This field is valid for \texttt{V4L2_CTRL_FLAG_MENU} type controls.
| __s64 | value | Value of the integer menu item. This field is valid for \texttt{V4L2_CTRL_FLAG_INTEGER_MENU} type controls.
| __u32 | reserved | Reserved for future extensions. Drivers must set the array to zero.

<tr>
<td>Description</td>
<td>This control has a pointer type, so its value has to be accessed using one of the pointer fields of struct v4l2_ext_control. This flag is set for controls that are an array, string, or have a compound type. In all cases you have to set a pointer to memory containing the payload of the control.</td>
</tr>
<tr>
<td>V4L2_CTRL_FLAG_EXECUTE_ON_WRITE</td>
<td>0x0200</td>
</tr>
<tr>
<td>Description</td>
<td>The value provided to the control will be propagated to the driver even if it remains constant. This is required when the control represents an action on the hardware. For example: clearing an error flag or triggering the flash. All the controls of the type V4L2_CTRL_TYPE_BUTTON have this flag set.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**EINVAL** The struct v4l2_queryctrl id is invalid. The struct v4l2_querymenu id is invalid or index is out of range (less than minimum or greater than maximum) or this particular menu item is not supported by the driver.

**EACCES** An attempt was made to read a write-only control.

**ioctl VIDIOC_QUERY_DV_TIMINGS**

**Name**

VIDIOC_QUERY_DV_TIMINGS - VIDIOC_SUBDEV_QUERY_DV_TIMINGS - Sense the DV preset received by the current input

1.2. Part I - Video for Linux API 275
Synopsis

int ioctl(int fd, VIDIOC_QUERY_DV_TIMINGS, struct v4l2_dv_timings *argp)
int ioctl(int fd, VIDIOC_SUBDEV_QUERY_DV_TIMINGS, struct v4l2_dv_timings *argp)

Arguments

fd  File descriptor returned by  open() .
argp

Description

The hardware may be able to detect the current DV timings automatically, similar to sensing the video standard. To do so, applications call  ioctl VIDIOC_QUERY_DV_TIMINGS  with a pointer to a struct v4l2_dv_timings . Once the hardware detects the timings, it will fill in the timings structure.

Note:

Drivers shall not switch timings automatically if new timings are detected. Instead, drivers should send the V4L2_EVENT_SOURCE_CHANGE event (if they support this) and expect that userspace will take action by calling  ioctl VIDIOC_QUERY_DV_TIMINGS . The reason is that new timings usually mean different buffer sizes as well, and you cannot change buffer sizes on the fly. In general, applications that receive the Source Change event will have to call  ioctl VIDIOC_QUERY_DV_TIMINGS , and if the detected timings are valid they will have to stop streaming, set the new timings, allocate new buffers and start streaming again.

If the timings could not be detected because there was no signal, then ENOLINK is returned. If a signal was detected, but it was unstable and the receiver could not lock to the signal, then ENOLCK is returned. If the receiver could lock to the signal, but the format is unsupported (e.g. because the pixelclock is out of range of the hardware capabilities), then the driver fills in whatever timings it could find and returns ERANGE. In that case the application can call  ioctl VIDIOC_DV_TIMINGS_CAP, VIDIOC_SUBDEV_DV_TIMINGS_CAP  to compare the found timings with the hardware’s capabilities in order to give more precise feedback to the user.

Return Value

On success 0 is returned, on error -1 and the  errno variable is set appropriately. The generic error codes are described at the  Generic Error Codes chapter.

ENODATA  Digital video timings are not supported for this input or output.
ENOLINK  No timings could be detected because no signal was found.
ENOLCK  The signal was unstable and the hardware could not lock on to it.
ERANGE  Timings were found, but they are out of range of the hardware capabilities.

ioctl VIDIOC_QUERYSTD

Name

VIDIOC_QUERYSTD - Sense the video standard received by the current input
Synopsis

```c
int ioctl(int fd, VIDIOC_QUERYSTD, v4l2_std_id *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp**

Description

The hardware may be able to detect the current video standard automatically. To do so, applications call `ioctl VIDIOC_QUERYSTD` with a pointer to a `v4l2_std_id` type. The driver stores here a set of candidates, this can be a single flag or a set of supported standards if for example the hardware can only distinguish between 50 and 60 Hz systems. If no signal was detected, then the driver will return V4L2_STD_UNKNOWN. When detection is not possible or fails, the set must contain all standards supported by the current video input or output.

**Note:**

Drivers shall not switch the video standard automatically if a new video standard is detected. Instead, drivers should send the V4L2_EVENT_SOURCE_CHANGE event (if they support this) and expect that userspace will take action by calling `ioctl VIDIOC_QUERYSTD`. The reason is that a new video standard can mean different buffer sizes as well, and you cannot change buffer sizes on the fly. In general, applications that receive the Source Change event will have to call `ioctl VIDIOC_QUERYSTD`, and if the detected video standard is valid they will have to stop streaming, set the new standard, allocate new buffers and start streaming again.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**ENODATA** Standard video timings are not supported for this input or output.

`ioctl VIDIOC_REQBUFS`

Name

VIDIOC_REQBUFS - Initiate Memory Mapping, User Pointer I/O or DMA buffer I/O

Synopsis

```c
int ioctl(int fd, VIDIOC_REQBUFS, struct v4l2_requestbuffers *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp**
Description

This ioctl is used to initiate memory mapped, user pointer or DMABUF based I/O. Memory mapped buffers are located in device memory and must be allocated with this ioctl before they can be mapped into the application's address space. User buffers are allocated by applications themselves, and this ioctl is merely used to switch the driver into user pointer I/O mode and to setup some internal structures. Similarly, DMABUF buffers are allocated by applications through a device driver, and this ioctl only configures the driver into DMABUF I/O mode without performing any direct allocation.

To allocate device buffers applications initialize all fields of the `struct v4l2_requestbuffers` structure. They set the `type` field to the respective stream or buffer type, the `count` field to the desired number of buffers, `memory` must be set to the requested I/O method and the `reserved` array must be zeroed. When the ioctl is called with a pointer to this structure the driver will attempt to allocate the requested number of buffers and it stores the actual number allocated in the `count` field. It can be smaller than the number requested, even zero, when the driver runs out of free memory. A larger number is also possible when the driver requires more buffers to function correctly. For example video output requires at least two buffers, one displayed and one filled by the application.

When the I/O method is not supported the ioctl returns an EINVAL error code.

Applications can call `ioctl VIDIOC_REQBUFS` again to change the number of buffers, however this cannot succeed when any buffers are still mapped. A `count` value of zero frees all buffers, after aborting or finishing any DMA in progress, an implicit `VIDIOC_STREAMOFF`.

Table 1.145: `struct v4l2_requestbuffers`

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32</td>
<td>count</td>
</tr>
<tr>
<td>__u32</td>
<td>type</td>
</tr>
<tr>
<td>__u32</td>
<td>memory</td>
</tr>
<tr>
<td>__u32</td>
<td>reserved[2]</td>
</tr>
</tbody>
</table>

The number of buffers requested or granted.
Type of the stream or buffers, this is the same as the `struct v4l2_format` type field. See `enum v4l2_buf_type` for valid values.
Applications set this field to V4L2_MEMORY_MMAP, V4L2_MEMORY_DMABUF or V4L2_MEMORY_USERPTR. See `enum v4l2_memory`.
A place holder for future extensions. Drivers and applications must set the array to zero.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

EINVAL The buffer type (`type` field) or the requested I/O method (`memory`) is not supported.

`ioctl VIDIOC_S_HW_FREQ_SEEK`

Name

VIDIOC_S_HW_FREQ_SEEK - Perform a hardware frequency seek

Synopsis

```c
int ioctl(int fd, VIDIOC_S_HW_FREQ_SEEK, struct v4l2_hw_freq_seek *argp)
```

Arguments

`fd` File descriptor returned by `open()`.
Description

Start a hardware frequency seek from the current frequency. To do this applications initialize the tuner, type, seek_upward, wrap_around, spacing, rangelow and rangehigh fields, and zero out the reserved array of a struct `v4l2_hw_freq_seek` and call the VIDIOC_S_HW_FREQ_SEEK ioctl with a pointer to this structure.

The rangelow and rangehigh fields can be set to a non-zero value to tell the driver to search a specific band. If the struct `v4l2_tuner` capability field has the V4L2_TUNER_CAP_HWSSEEK_PROG_LIM flag set, these values must fall within one of the bands returned by `ioctl VIDIOC_ENUM_FREQ_BANDS`. If the V4L2_TUNER_CAP_HWSSEEK_PROG_LIM flag is not set, then these values must exactly match those of one of the bands returned by `ioctl VIDIOC_ENUM_FREQ_BANDS`. If the current frequency of the tuner does not fall within the selected band it will be clamped to fit in the band before the seek is started.

If an error is returned, then the original frequency will be restored.

This ioctl is supported if the V4L2_CAP_HW_FREQ_SEEK capability is set.

If this ioctl is called from a non-blocking filehandle, then EAGAIN error code is returned and no seek takes place.

If rangehigh is zero a reasonable default value is used.</td>
</tr>
</tbody>
</table>
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EINVAL** The tuner index is out of bounds, the wrap_around value is not supported or one of the values in the type, rangelow or rangehigh fields is wrong.

**EAGAIN** Attempted to call `VIDIOC_S_HW_FREQSEEK` with the filehandle in non-blocking mode.

**ENOMEM** The hardware seek found no channels.

**EBUSY** Another hardware seek is already in progress.

**ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF**

**Name**

`VIDIOC_STREAMON` - `VIDIOC_STREAMOFF` - Start or stop streaming I/O

**Synopsis**

```c
int ioctl(int fd, VIDIOC_STREAMON, const int *argp)
int ioctl(int fd, VIDIOC_STREAMOFF, const int *argp)
```

**Arguments**

*fd* File descriptor returned by *open*. 

*argp*

**Description**

The `VIDIOC_STREAMON` and `VIDIOC_STREAMOFF` ioctl start and stop the capture or output process during streaming (*memory mapping*, *user pointer* or *DMABUF*) I/O.

Capture hardware is disabled and no input buffers are filled (if there are any empty buffers in the incoming queue) until `VIDIOC_STREAMON` has been called. Output hardware is disabled and no video signal is produced until `VIDIOC_STREAMON` has been called. The ioctl will succeed when at least one output buffer is in the incoming queue.

Memory-to-memory devices will not start until `VIDIOC_STREAMON` has been called for both the capture and output stream types.

If `VIDIOC_STREAMON` fails then any already queued buffers will remain queued.

The `VIDIOC_STREAMOFF` ioctl, apart of aborting or finishing any DMA in progress, unlocks any user pointer buffers locked in physical memory, and it removes all buffers from the incoming and outgoing queues. That means all images captured but not dequeued yet will be lost, likewise all images enqueued for output but not transmitted yet. I/O returns to the same state as after calling `ioctl VIDIOC_REQBUFS` and can be restarted accordingly.

If buffers have been queued with `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` and `VIDIOC_STREAMOFF` is called without ever having called `VIDIOC_STREAMON`, then those queued buffers will also be removed from the incoming queue and all are returned to the same state as after calling `ioctl VIDIOC_REQBUFS` and can be restarted accordingly.

Both ioctlS take a pointer to an integer, the desired buffer or stream type. This is the same as struct *v4l2_requestbuffers* type.
If VIDIOC_STREAMON is called when streaming is already in progress, or if VIDIOC_STREAMOFF is called when streaming is already stopped, then 0 is returned. Nothing happens in the case of VIDIOC_STREAMON, but VIDIOC_STREAMOFF will return queued buffers to their starting state as mentioned above.

**Note:**

Applications can be preempted for unknown periods right before or after the VIDIOC_STREAMON or VIDIOC_STREAMOFF calls, there is no notion of starting or stopping “now”. Buffer timestamps can be used to synchronize with other events.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

- **EINVAL** The buffer type is not supported, or no buffers have been allocated (memory mapping) or en-queued (output) yet.
- **EPIPE** The driver implements pad-level format configuration and the pipeline configuration is invalid.
- **ENOLINK** The driver implements Media Controller interface and the pipeline link configuration is invalid.

**ioctl VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL**

**Name**

VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL - Enumerate frame intervals

**Synopsis**

```c
int ioctl(int fd, VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL, struct v4l2_subdev_frame_interval_enum *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp`

**Description**

This ioctl lets applications enumerate available frame intervals on a given sub-device pad. Frame intervals only makes sense for sub-devices that can control the frame period on their own. This includes, for instance, image sensors and TV tuners.

For the common use case of image sensors, the frame intervals available on the sub-device output pad depend on the frame format and size on the same pad. Applications must thus specify the desired format and size when enumerating frame intervals.

To enumerate frame intervals applications initialize the `index`, `pad`, `which`, `code`, `width` and `height` fields of `struct v4l2_subdev_frame_interval_enum` and call the `ioctl VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL` ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code if one of the input fields is invalid. All frame intervals are enumerable by beginning at index zero and incrementing by one until EINVAL is returned.
Available frame intervals may depend on the current ‘try’ formats at other pads of the sub-device, as well as on the current active links. See `ioctl VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT` for more information about the try formats.

Sub-devices that support the frame interval enumeration ioctl should implemented it on a single pad only. Its behaviour when supported on multiple pads of the same sub-device is not defined.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct `v4l2_subdev_frame_interval_enum` pad references a non-existing pad, one of the code, width or height fields are invalid for the given pad or the index field is out of bounds.

**ioctl VIDIOC_SUBDEV_ENUM_FRAME_SIZE**

Name

VIDIOC_SUBDEV_ENUM_FRAME_SIZE - Enumerate media bus frame sizes

Synopsis

```
int ioctl(int fd, VIDIOC_SUBDEV_ENUM_FRAME_SIZE, struct v4l2_subdev_frame_size_enum * argp)
```

Arguments

*fd* File descriptor returned by `open()`.

*argp*

Description

This ioctl allows applications to enumerate all frame sizes supported by a sub-device on the given pad for the given media bus format. Supported formats can be retrieved with the `ioctl VIDIOC_SUBDEV_ENUM_MBUS_CODE` ioctl.
To enumerate frame sizes applications initialize the pad, which, code and index fields of the struct `v4l2_subdev_mbus_code_enum` and call the `ioctl VIDIOC_SUBDEV_ENUM_FRAME_SIZE` ioctl with a pointer to the structure. Drivers fill the minimum and maximum frame sizes or return an EINVAL error code if one of the input parameters is invalid.

Sub-devices that only support discrete frame sizes (such as most sensors) will return one or more frame sizes with identical minimum and maximum values.

Not all possible sizes in given [minimum, maximum] ranges need to be supported. For instance, a scaler that uses a fixed-point scaling ratio might not be able to produce every frame size between the minimum and maximum values. Applications must use the `VIDIOC_SUBDEV_S_FMT` ioctl to try the sub-device for an exact supported frame size.

Available frame sizes may depend on the current ‘try’ formats at other pads of the sub-device, as well as on the current active links and the current values of V4L2 controls. See `ioctl VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT` for more information about try formats.

| __u32 | index | Number of the format in the enumeration, set by the application. |
| __u32 | pad   | Pad number as reported by the media controller API. |
| __u32 | code  | The media bus format code, as defined in Media Bus Formats. |
| __u32 | min_width | Minimum frame width, in pixels. |
| __u32 | max_width | Maximum frame width, in pixels. |
| __u32 | min_height | Minimum frame height, in pixels. |
| __u32 | max_height | Maximum frame height, in pixels. |
| __u32 | which | Frame sizes to be enumerated, from enum `v4l2_subdev_format_whence`. |
| __u32 | reserved[8] | Reserved for future extensions. Applications and drivers must set the array to zero. |

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**EINVAL** The struct `v4l2_subdev_frame_size_enum` pad references a non-existing pad, the code is invalid for the given pad or the `index` field is out of bounds.

**ioct**l `VIDIOC_SUBDEV_ENUM_MBUS_CODE`

**Name**

`VIDIOC_SUBDEV_ENUM_MBUS_CODE` - Enumerate media bus formats

**Synopsis**

```c
int ioctl(int fd, VIDIOC_SUBDEV_ENUM_MBUS_CODE, struct v4l2_subdev_mbus_code_enum *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
Description

To enumerate media bus formats available at a given sub-device pad applications initialize the pad, which and index fields of struct `v4l2_subdev_mbus_code_enum` and call the `ioctl VIDIOC_SUBDEV_ENUM_MBUS_CODE` ioctl with a pointer to this structure. Drivers fill the rest of the structure or return an EINVAL error code if either the pad or index are invalid. All media bus formats are enumerable by beginning at index zero and incrementing by one until EINVAL is returned.

Available media bus formats may depend on the current ‘try’ formats at other pads of the sub-device, as well as on the current active links. See `ioctl VIDIOC_SUBDEV_G_FMT, VIDIOC_SUBDEV_S_FMT` for more information about the try formats.

| __u32  | pad                        | Pad number as reported by the media controller API. |
| __u32  | index                     | Number of the format in the enumeration, set by the application. |
| __u32  | code                      | The media bus format code, as defined in `Media Bus Formats`. |
| __u32  | which                     | Media bus format codes to be enumerated, from enum `v4l2_subdev_format_whence`. |
| __u32  | reserved[8]               | Reserved for future extensions. Applications and drivers must set the array to zero. |

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

EINVAL The struct `v4l2_subdev_mbus_code_enum` pad references a non-existing pad, or the index field is out of bounds.

`ioctl VIDIOC_SUBDEV_G_CROP, VIDIOC_SUBDEV_S_CROP`

Name

VIDIOC_SUBDEV_G_CROP - VIDIOC_SUBDEV_S_CROP - Get or set the crop rectangle on a subdev pad

Synopsis

```c
int ioctl(int fd, VIDIOC_SUBDEV_G_CROP, struct v4l2_subdev_crop *argp)
int ioctl(int fd, VIDIOC_SUBDEV_S_CROP, const struct v4l2_subdev_crop *argp)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `argp`
Description

Note:

This is an Obsolete API Elements interface and may be removed in the future. It is superseded by the selection API.

To retrieve the current crop rectangle applications set the pad field of a struct `v4l2_subdev_crop` to the desired pad number as reported by the media API and the which field to `V4L2_SUBDEV_FORMAT_ACTIVE`. They then call the `VIDIOC_SUBDEV_G_CROP` ioctl with a pointer to this structure. The driver fills the members of the rect field or returns `EINVAL` error code if the input arguments are invalid, or if cropping is not supported on the given pad.

To change the current crop rectangle applications set both the pad and which fields and all members of the rect field. They then call the `VIDIOC_SUBDEV_S_CROP` ioctl with a pointer to this structure. The driver verifies the requested crop rectangle, adjusts it based on the hardware capabilities and configures the device. Upon return the struct `v4l2_subdev_crop` contains the current format as would be returned by a `VIDIOC_SUBDEV_G_CROP` call.

Applications can query the device capabilities by setting the which to `V4L2_SUBDEV_FORMAT_TRY`. When set, 'try' crop rectangles are not applied to the device by the driver, but are mangled exactly as active crop rectangles and stored in the sub-device file handle. Two applications querying the same sub-device would thus not interact with each other.

Drivers must not return an error solely because the requested crop rectangle doesn’t match the device capabilities. They must instead modify the rectangle to match what the hardware can provide. The modified format should be as close as possible to the original request.

Table 1.150: struct v4l2_subdev_crop

ReturnValue

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**EBUSY** The crop rectangle can’t be changed because the pad is currently busy. This can be caused, for instance, by an active video stream on the pad. The ioctl must not be retried without performing another action to fix the problem first. Only returned by `VIDIOC_SUBDEV_S_CROP`.

**EINVAL** The struct `v4l2_subdev_crop` pad references a non-existing pad, the which field references a non-existing format, or cropping is not supported on the given subdev pad.

**ioctl** `VIDIOC_SUBDEV_G_FMT`, `VIDIOC_SUBDEV_S_FMT`

Name

`VIDIOC_SUBDEV_G_FMT` · `VIDIOC_SUBDEV_S_FMT` - Get or set the data format on a subdev pad
Synopsis

```c
int ioctl(int fd, VIDIOC_SUBDEV_G_FMT, struct v4l2_subdev_format *argp)
int ioctl(int fd, VIDIOC_SUBDEV_S_FMT, struct v4l2_subdev_format *argp)
```

Arguments

- **fd**: File descriptor returned by `open()`.
- **argp**: Structure pointer.

Description

These ioctls are used to negotiate the frame format at specific subdev pads in the image pipeline.

To retrieve the current format, applications set the `pad` field of a `struct v4l2_subdev_format` to the desired pad number as reported by the media API and the `which` field to `V4L2_SUBDEV_FORMAT_ACTIVE`. When they call the `VIDIOC_SUBDEV_G_FMT` ioctl with a pointer to this structure, the driver fills the members of the `format` field.

To change the current format, applications set both the `pad` and `which` fields and all members of the `format` field. When they call the `VIDIOC_SUBDEV_S_FMT` ioctl with a pointer to this structure, the driver verifies the requested format, adjusts it based on the hardware capabilities, and configures the device. Upon return, the `struct v4l2_subdev_format` contains the current format as would be returned by a `VIDIOC_SUBDEV_G_FMT` call.

Applications can query the device capabilities by setting the `which` to `V4L2_SUBDEV_FORMAT_TRY`. When set, ‘try’ formats are not applied to the device by the driver, but are changed exactly as active formats and stored in the sub-device file handle. Two applications querying the same sub-device would thus not interact with each other.

For instance, to try a format at the output pad of a sub-device, applications would first set the try format at the sub-device input with the `VIDIOC_SUBDEV_S_FMT` ioctl. They would then either retrieve the default format at the output pad with the `VIDIOC_SUBDEV_G_FMT` ioctl, or set the desired output pad format with the `VIDIOC_SUBDEV_S_FMT` ioctl and check the returned value.

Try formats do not depend on active formats, but can depend on the current links configuration or sub-device controls value. For instance, a low-pass noise filter might crop pixels at the frame boundaries, modifying its output frame size.

Drivers must not return an error solely because the requested format doesn’t match the device capabilities. They must instead modify the format to match what the hardware can provide. The modified format should be as close as possible to the original request.

### V4L2_SUBDEV_FORMAT_WHENCE

<table>
<thead>
<tr>
<th>Enum Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V4L2_SUBDEV_FORMAT_TRY</td>
<td>0</td>
<td>Try formats, used for querying device capabilities.</td>
</tr>
<tr>
<td>V4L2_SUBDEV_FORMAT_ACTIVE</td>
<td>1</td>
<td>Active formats, applied to the hardware.</td>
</tr>
</tbody>
</table>

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

**EBUSY** The format can’t be changed because the pad is currently busy. This can be caused, for instance, by an active video stream on the pad. The ioctl must not be retried without performing another action to fix the problem first. Only returned by VIDIOC_SUBDEV_S_FMT

**EINVAL** The struct `v4l2_subdev_format` pad references a non-existing pad, or the `which` field references a non-existing format.

---

**ioctl VIDIOC_SUBDEV_G_FRAME_INTERVAL, VIDIOC_SUBDEV_S_FRAME_INTERVAL**

**Name**

`VIDIOC_SUBDEV_G_FRAME_INTERVAL - VIDIOC_SUBDEV_S_FRAME_INTERVAL` - Get or set the frame interval on a subdev pad

**Synopsis**

```c
int ioctl(int fd, VIDIOC_SUBDEV_G_FRAME_INTERVAL, struct v4l2_subdev_frame_interval *argp)
int ioctl(int fd, VIDIOC_SUBDEV_S_FRAME_INTERVAL, struct v4l2_subdev_frame_interval *argp)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `argp`  

**Description**

These ioctlts are used to get and set the frame interval at specific subdev pads in the image pipeline. The frame interval only makes sense for sub-devices that can control the frame period on their own. This includes, for instance, image sensors and TV tuners. Sub-devices that don’t support frame intervals must not implement these ioctlts.

To retrieve the current frame interval applications set the `pad` field of a struct `v4l2_subdev_frame_interval` to the desired pad number as reported by the media controller API. When they call the VIDIOC_SUBDEV_G_FRAME_INTERVAL ioctl with a pointer to this structure the driver fills the members of the interval field.

To change the current frame interval applications set both the `pad` field and all members of the interval field. When they call the VIDIOC_SUBDEV_S_FRAME_INTERVAL ioctl with a pointer to this structure the driver verifies the requested interval, adjusts it based on the hardware capabilities and configures the...
device. Upon return the struct `v4l2_subdev_frame_interval` contains the current frame interval as would be returned by a `VIDIOC_SUBDEV_G_FRAME_INTERVAL` call.

Drivers must not return an error solely because the requested interval doesn’t match the device capabilities. They must instead modify the interval to match what the hardware can provide. The modified interval should be as close as possible to the original request.

Sub-devices that support the frame interval ioctl should implement them on a single pad only. Their behaviour when supported on multiple pads of the same sub-device is not defined.

<table>

<tr>
<th>pad</th>
<th>Pad number as reported by the media controller API.</th>
</tr>
</thead>
<tbody>
<tr>
<td>struct <code>v4l2_fract</code></td>
<td>Period, in seconds, between consecutive video frames.</td>
</tr>
<tr>
<td>__u32</td>
<td>reserved[9]</td>
</tr>
</tbody>
</table>

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**EBUSY** The frame interval can’t be changed because the pad is currently busy. This can be caused, for instance, by an active video stream on the pad. The ioctl must not be retried without performing another action to fix the problem first. Only returned by `VIDIOC_SUBDEV_S_FRAME_INTERVAL`.

**EINVAL** The struct `v4l2_subdev_frame_interval` pad references a non-existing pad, or the pad doesn’t support frame intervals.

**ioctl VIDIOC_SUBDEV_G_SELECTION, VIDIOC_SUBDEV_S_SELECTION**

**Name**

VIDIOC_SUBDEV_G_SELECTION - VIDIOC_SUBDEV_S_SELECTION - Get or set selection rectangles on a sub-dev pad

**Synopsis**

```c
int ioctl(int fd, VIDIOC_SUBDEV_G_SELECTION, struct v4l2_subdev_selection *argp)
int ioctl(int fd, VIDIOC_SUBDEV_S_SELECTION, struct v4l2_subdev_selection *argp)
```

**Arguments**

`fd` File descriptor returned by `open()`.

`argp`

**Description**

The selections are used to configure various image processing functionality performed by the subdevs which affect the image size. This currently includes cropping, scaling and composition.
The selection API replaces *the old subdev crop API*. All the function of the crop API, and more, are supported by the selections API.

See *Sub-device Interface* for more information on how each selection target affects the image processing pipeline inside the subdevice.

**Types of selection targets**

There are two types of selection targets: actual and bounds. The actual targets are the targets which configure the hardware. The BOUNDS target will return a rectangle that contain all possible actual rectangles.

**Discovering supported features**

To discover which targets are supported, the user can perform VIDIOC_SUBDEV_G_SELECTION on them. Any unsupported target will return EINVAL.

Selection targets and flags are documented in *Common selection definitions*.

<table>
<thead>
<tr>
<th>Table 1.154: struct v4l2_subdev_selection</th>

<tr>
<td>Active or try selection, from enum v4l2_subdev_format_whence. Pad number as reported by the media framework. Target selection rectangle. See <em>Common selection definitions</em>. Flags. See <em>Selection flags</em>. Selection rectangle, in pixels. Reserved for future extensions. Applications and drivers must set the array to zero.</td>
</tr>
</tbody>
</table>

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**EBUSY** The selection rectangle can’t be changed because the pad is currently busy. This can be caused, for instance, by an active video stream on the pad. The ioctl must not be retried without performing another action to fix the problem first. Only returned by VIDIOC_SUBDEV_S_SELECTION

**EINVAL** The struct v4l2_subdev_selection pad references a non-existing pad, the which field references a non-existing format, or the selection target is not supported on the given subdev pad.

**ioctl VIDIOC_SUBSCRIBE_EVENT, VIDIOC_UNSUBSCRIBE_EVENT**

**Name**

VIDIOC_SUBSCRIBE_EVENT - VIDIOC_UNSUBSCRIBE_EVENT - Subscribe or unsubscribe event

**Synopsis**

```c
int ioctl(int fd, VIDIOC_SUBSCRIBE_EVENT, struct v4l2_event_subscription *argp)
int ioctl(int fd, VIDIOC_UNSUBSCRIBE_EVENT, struct v4l2_event_subscription *argp)
```
Arguments

fd  File descriptor returned by `open()`.

argp

Description

Subscribe or unsubscribe V4L2 event. Subscribed events are dequeued by using the `ioctl VIDIOC_DQEVENT` ioctl.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.
V4L2 mmap()

Name

v4l2-mmap - Map device memory into application address space

Synopsis

```c
#include <unistd.h>
#include <sys/mman.h>

void *mmap(void *start, size_t length, int prot, int flags, int fd, off_t offset)
```

Arguments

- **start** Map the buffer to this address in the application’s address space. When the MAP_FIXED flag is specified, `start` must be a multiple of the pagesize and `mmap` will fail when the specified address cannot be used. Use of this option is discouraged; applications should just specify a NULL pointer here.

- **length** Length of the memory area to map. This must be the same value as returned by the driver in the struct `v4l2_buffer` length field for the single-planar API, and the same value as returned by the driver in the struct `v4l2_plane` length field for the multi-planar API.

- **prot** The `prot` argument describes the desired memory protection. Regardless of the device type and the direction of data exchange it should be set to `PROT_READ | PROT_WRITE`, permitting read and write access to image buffers. Drivers should support at least this combination of flags.

**Note:**

1. The Linux videobuf kernel module, which is used by some drivers supports only `PROT_READ` or `PROT_WRITE`. When the driver does not support the desired protection, the `mmap()` function fails.

2. Device memory accesses (e.g. the memory on a graphics card with video capturing hardware) may incur a performance penalty compared to main memory accesses, or reads may be significantly slower than writes or vice versa. Other I/O methods may be more efficient in such case.

- **flags** The `flags` parameter specifies the type of the mapped object, mapping options and whether modifications made to the mapped copy of the page are private to the process or are to be shared with other references.

  MAP_FIXED requests that the driver selects no other address than the one specified. If the specified address cannot be used, `mmap()` will fail. If MAP_FIXED is specified, `start` must be a multiple of the pagesize. Use of this option is discouraged.

  One of the MAP_SHARED or MAP_PRIVATE flags must be set. MAP_SHARED allows applications to share the mapped memory with other (e.g. child-) processes.

**Note:**

The Linux videobuf module which is used by some drivers supports only MAP_SHARED. MAP_PRIVATE requests copy-on-write semantics. V4L2 applications should not set the MAP_PRIVATE, MAP_DENYWRITE, MAP_EXECUTABLE or MAP_ANON flags.
File descriptor returned by `open()`.

**offset** Offset of the buffer in device memory. This must be the same value as returned by the driver in the struct `v4l2_buffer` `m` union offset field for the single-planar API, and the same value as returned by the driver in the struct `v4l2_plane` `m` union `mem_offset` field for the multi-planar API.

### Description

The `mmap()` function asks to map `length` bytes starting at `offset` in the memory of the device specified by `fd` into the application address space, preferably at address `start`. This latter address is a hint only, and is usually specified as 0.

Suitable length and offset parameters are queried with the `ioctl VIDIOC_QUERYBUF` ioctl. Buffers must be allocated with the `ioctl VIDIOC_REQBUFS` ioctl before they can be queried.

To unmap buffers the `munmap()` function is used.

### Return Value

On success `mmap()` returns a pointer to the mapped buffer. On error `MAP_FAILED` (-1) is returned, and the `errno` variable is set appropriately. Possible error codes are:

- **EBADF** `fd` is not a valid file descriptor.
- **EACCES** `fd` is not open for reading and writing.
- **EINVAL** The `start` or `length` or `offset` are not suitable. (E. g. they are too large, or not aligned on a PAGESIZE boundary.)
  - The flags or `prot` value is not supported.
  - No buffers have been allocated with the `ioctl VIDIOC_REQBUFS` ioctl.
- **ENOMEM** Not enough physical or virtual memory was available to complete the request.

### V4L2 munmap()

#### Name

`v4l2-munmap` - Unmap device memory

#### Synopsis

```c
#include <unistd.h>
#include <sys/mman.h>

int munmap(void *start, size_t length)
```

#### Arguments

- **start** Address of the mapped buffer as returned by the `mmap()` function.
- **length** Length of the mapped buffer. This must be the same value as given to `mmap()` and returned by the driver in the struct `v4l2_buffer` `length` field for the single-planar API and in the struct `v4l2_plane` `length` field for the multi-planar API.
Description

Unmaps a previously with the `mmap()` function mapped buffer and frees it, if possible.

Return Value

On success `munmap()` returns 0, on failure -1 and the `errno` variable is set appropriately:

**EINVAL** The start or length is incorrect, or no buffers have been mapped yet.

V4L2 open()

Name

v4l2-open - Open a V4L2 device

Synopsis

```
#include <fcntl.h>

int open(const char *device_name, int flags)
```

Arguments

device_name Device to be opened.

flags Open flags. Access mode must be O_RDWR. This is just a technicality, input devices still support only reading and output devices only writing.

When the O_NONBLOCK flag is given, the `read()` function and the `VIDIOC_DQBUF` ioctl will return the EAGAIN error code when no data is available or no buffer is in the driver outgoing queue, otherwise these functions block until data becomes available. All V4L2 drivers exchanging data with applications must support the O_NONBLOCK flag.

Other flags have no effect.

Description

To open a V4L2 device applications call `open()` with the desired device name. This function has no side effects; all data format parameters, current input or output, control values or other properties remain unchanged. At the first `open()` call after loading the driver they will be reset to default values, drivers are never in an undefined state.

Return Value

On success `open()` returns the new file descriptor. On error -1 is returned, and the `errno` variable is set appropriately. Possible error codes are:

**EACCES** The caller has no permission to access the device.

**EBUSY** The driver does not support multiple opens and the device is already in use.

**ENXIO** No device corresponding to this device special file exists.

**ENOMEM** Not enough kernel memory was available to complete the request.
**EMFILE** The process already has the maximum number of files open.

**ENFILE** The limit on the total number of files open on the system has been reached.

### V4L2 poll()

#### Name

v4l2-poll - Wait for some event on a file descriptor

#### Synopsis

```c
#include <sys/poll.h>

int poll(struct pollfd *ufds, unsigned int nfds, int timeout)

name: v4l2-poll()
```

#### Arguments

**Description**

With the `poll()` function applications can suspend execution until the driver has captured data or is ready to accept data for output.

When streaming I/O has been negotiated this function waits until a buffer has been filled by the capture device and can be dequeued with the `VIDIOC_DQBUF` ioctl. For output devices this function waits until the device is ready to accept a new buffer to be queued up with the `ioctl VIDIOC_QBUF, VIDIOC_DQBUF` ioctl for display. When buffers are already in the outgoing queue of the driver (capture) or the incoming queue isn’t full (display) the function returns immediately.

On success `poll()` returns the number of file descriptors that have been selected (that is, file descriptors for which the `revents` field of the respective `struct pollfd()` structure is non-zero). Capture devices set the POLLIN and POLLRD_NORM flags in the `revents` field, output devices the POLLOUT and POLLWRNORM flags. When the function timed out it returns a value of zero, on failure it returns -1 and the `errno` variable is set appropriately. When the application did not call `ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF` the `poll()` function succeeds, but sets the POLLERR flag in the `revents` field. When the application has called `ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF` for a capture device but hasn’t yet called `ioctl VIDIOC_QBUF, VIDIOC_DQBUF`, the `poll()` function succeeds and sets the POLLERR flag in the `revents` field. For output devices this same situation will cause `poll()` to succeed as well, but it sets the POLLOUT and POLLWRNORM flags in the `revents` field.

If an event occurred (see `ioctl VIDIOC_DQEVENT`) then POLLPRI will be set in the `revents` field and `poll()` will return.

When use of the `read()` function has been negotiated and the driver does not capture yet, the `poll()` function starts capturing. When that fails it returns a POLLERR as above. Otherwise it waits until data has been captured and can be read. When the driver captures continuously (as opposed to, for example, still images) the function may return immediately.

When use of the `write()` function has been negotiated and the driver does not stream yet, the `poll()` function starts streaming. When that fails it returns a POLLERR as above. Otherwise it waits until the driver is ready for a non-blocking `write()` call.

If the caller is only interested in events (just POLLPRI is set in the `revents` field), then `poll()` will not start streaming if the driver does not stream yet. This makes it possible to just poll for events and not for buffers.

All drivers implementing the `read()` or `write()` function or streaming I/O must also support the `poll()` function.
For more details see the `poll()` manual page.

**Return Value**

On success, `poll()` returns the number structures which have non-zero `revents` fields, or zero if the call timed out. On error -1 is returned, and the `errno` variable is set appropriately:

- **EBADF** One or more of the `ufds` members specify an invalid file descriptor.
- **EBUSY** The driver does not support multiple read or write streams and the device is already in use.
- **EFAULT** `ufds` references an inaccessible memory area.
- **EINTR** The call was interrupted by a signal.
- **EINVAL** The `nfds` argument is greater than `OPEN_MAX`.

### V4L2 read()

**Name**

v4l2-read - Read from a V4L2 device

**Synopsis**

```c
#include <unistd.h>

ssize_t read(int fd, void *buf, size_t count)
```

**Arguments**

- `fd` File descriptor returned by `open`.
- `buf` Buffer to be filled
- `count` Max number of bytes to read

**Description**

`read()` attempts to read up to `count` bytes from file descriptor `fd` into the buffer starting at `buf`. The layout of the data in the buffer is discussed in the respective device interface section, see `##`. If `count` is zero, `read()` returns zero and has no other results. If `count` is greater than `SSIZE_MAX`, the result is unspecified. Regardless of the `count` value each `read()` call will provide at most one frame (two fields) worth of data.

By default `read()` blocks until data becomes available. When the `O_NONBLOCK` flag was given to the `open()` function it returns immediately with an EAGAIN error code when no data is available. The `select()` or `poll()` functions can always be used to suspend execution until data becomes available. All drivers supporting the `read()` function must also support `select()` and `poll()`.

Drivers can implement read functionality in different ways, using a single or multiple buffers and discarding the oldest or newest frames once the internal buffers are filled.

`read()` never returns a “snapshot” of a buffer being filled. Using a single buffer the driver will stop capturing when the application starts reading the buffer until the read is finished. Thus only the period of the vertical blanking interval is available for reading, or the capture rate must fall below the nominal frame rate of the video standard.
The behavior of `read()` when called during the active picture period or the vertical blanking separating the top and bottom field depends on the discarding policy. A driver discarding the oldest frames keeps capturing into an internal buffer, continuously overwriting the previously, not read frame, and returns the frame being received at the time of the `read()` call as soon as it is complete.

A driver discarding the newest frames stops capturing until the next `read()` call. The frame being received at `read()` time is discarded, returning the following frame instead. Again this implies a reduction of the capture rate to one half or less of the nominal frame rate. An example of this model is the video read mode of the bttv driver, initiating a DMA to user memory when `read()` is called and returning when the DMA finished.

In the multiple buffer model drivers maintain a ring of internal buffers, automatically advancing to the next free buffer. This allows continuous capturing when the application can empty the buffers fast enough. Again, the behavior when the driver runs out of free buffers depends on the discarding policy.

Applications can get and set the number of buffers used internally by the driver with the `VIDIOC_G_PARM` and `VIDIOC_S_PARM` ioctls. They are optional, however. The discarding policy is not reported and cannot be changed. For minimum requirements see `Interfaces`.

Return Value

On success, the number of bytes read is returned. It is not an error if this number is smaller than the number of bytes requested, or the amount of data required for one frame. This may happen for example because `read()` was interrupted by a signal. On error, -1 is returned, and the `errno` variable is set appropriately. In this case the next read will start at the beginning of a new frame. Possible error codes are:

- **EAGAIN** Non-blocking I/O has been selected using O_NONBLOCK and no data was immediately available for reading.
- **EBADF** `fd` is not a valid file descriptor or is not open for reading, or the process already has the maximum number of files open.
- **EBUSY** The driver does not support multiple read streams and the device is already in use.
- **EFAULT** `buf` references an inaccessible memory area.
- **EINTR** The call was interrupted by a signal before any data was read.
- **EIO** I/O error. This indicates some hardware problem or a failure to communicate with a remote device (USB camera etc.).
- **EINVAL** `read()` function is not supported by this driver, not on this device, or generally not on this type of device.

**V4L2 select()**

Name

v4l2-select - Synchronous I/O multiplexing

Synopsis

```c
#include <sys/time.h>
#include <sys/types.h>
#include <unistd.h>

int select(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, struct timeval *timeout)
```
Arguments

**nfds**  The highest-numbered file descriptor in any of the three sets, plus 1.

**readfds**  File descriptions to be watched if a read() call won’t block.

**writefds**  File descriptions to be watched if a write() won’t block.

**exceptfds**  File descriptions to be watched for V4L2 events.

**timeout**  Maximum time to wait.

Description

With the **select()** function applications can suspend execution until the driver has captured data or is ready to accept data for output.

When streaming I/O has been negotiated this function waits until a buffer has been filled or displayed and can be dequeued with the **VIDIOC_DQBUF** ioctl. When buffers are already in the outgoing queue of the driver the function returns immediately.

On success **select()** returns the total number of bits set in **struct fd_set()**. When the function timed out it returns a value of zero. On failure it returns -1 and the **errno** variable is set appropriately. When the application did not call **ioctl VIDIOC_QBUF, VIDIOC_DQBUF** or **ioctl VIDIOC_STREAMON, VIDIOC_STREAMOFF** yet the **select()** function succeeds, setting the bit of the file descriptor in readfds or writefds, but subsequent **VIDIOC_DQBUF** calls will fail. 1

When use of the **read()** function has been negotiated and the driver does not capture yet, the **select()** function starts capturing. When that fails, **select()** returns successful and a subsequent **read()** call, which also attempts to start capturing, will return an appropriate error code. When the driver captures continuously (as opposed to, for example, still images) and data is already available the **select()** function returns immediately.

When use of the **write()** function has been negotiated the **select()** function just waits until the driver is ready for a non-blocking **write()** call.

All drivers implementing the **read()** or **write()** function or streaming I/O must also support the **select()** function.

For more details see the **select()** manual page.

Return Value

On success, **select()** returns the number of descriptors contained in the three returned descriptor sets, which will be zero if the timeout expired. On error -1 is returned, and the **errno** variable is set appropriately; the sets and **timeout** are undefined. Possible error codes are:

- **EBADF**  One or more of the file descriptor sets specified a file descriptor that is not open.
- **EBUSY**  The driver does not support multiple read or write streams and the device is already in use.
- **EFAULT**  The readfds, writefds, exceptfds or timeout pointer references an inaccessible memory area.
- **EINVAL**  The **nfds** argument is less than zero or greater than **FD_SETSIZE**.

1. The Linux kernel implements **select()** like the **poll()** function, but **select()** cannot return a **POLLERR**.
**V4L2 write()**

**Name**

v4l2-write - Write to a V4L2 device

**Synopsis**

```c
#include <unistd.h>

ssize_t write(int fd, void *buf, size_t count)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `buf` Buffer with data to be written
- `count` Number of bytes at the buffer

**Description**

`write()` writes up to `count` bytes to the device referenced by the file descriptor `fd` from the buffer starting at `buf`. When the hardware outputs are not active yet, this function enables them. When `count` is zero, `write()` returns 0 without any other effect.

When the application does not provide more data in time, the previous video frame, raw VBI image, sliced VPS or WSS data is displayed again. Sliced Teletext or Closed Caption data is not repeated, the driver inserts a blank line instead.

**Return Value**

On success, the number of bytes written are returned. Zero indicates nothing was written. On error, -1 is returned, and the `errno` variable is set appropriately. In this case the next write will start at the beginning of a new frame. Possible error codes are:

- **EAGAIN** Non-blocking I/O has been selected using the `O_NONBLOCK` flag and no buffer space was available to write the data immediately.
- **EBADF** `fd` is not a valid file descriptor or is not open for writing.
- **EBUSY** The driver does not support multiple write streams and the device is already in use.
- **EFAULT** `buf` references an inaccessible memory area.
- **EINTR** The call was interrupted by a signal before any data was written.
- **EIO** I/O error. This indicates some hardware problem.
- **EINVAL** The `write()` function is not supported by this driver, not on this device, or generally not on this type of device.

**1.2.9 Common definitions for V4L2 and V4L2 subdev interfaces**

**Common selection definitions**

While the **V4L2 selection API** and **V4L2 subdev selection APIs** are very similar, there's one fundamental difference between the two. On sub-device API, the selection rectangle refers to the media bus format,
and is bound to a sub-device’s pad. On the V4L2 interface the selection rectangles refer to the in-memory pixel format.

This section defines the common definitions of the selection interfaces on the two APIs.

**Selection targets**

The precise meaning of the selection targets may be dependent on which of the two interfaces they are used.

/**
 * struct v4l2_plane - plane info for multi-planar buffers
 * @bytesused: number of bytes occupied by data in the plane (payload)
 * @length: size of this plane (NOT the payload) in bytes
 * @mem_offset: when memory in the associated struct v4l2_buffer is
V4L2_MEMORY_MMAP, equals the offset from the start of
the device memory for this plane (or is a `cookie' that
should be passed to mmap() called on the video node)
@userptr: when memory is V4L2_MEMORY_USERPTR, a userspace pointer
to the device memory for this plane
@fd: when memory is V4L2_MEMORY_DMABUF, a userspace file
descriptor associated with this plane
@data_offset: offset in the plane to the start of data; usually 0,
unless there is a header in front of the data

Multi-planar buffers consist of one or more planes, e.g. an YCbCr buffer
with two planes can have one plane for Y, and another for interleaved CbCr
components. Each plane can reside in a separate memory buffer, or even in
a completely separate memory node (e.g. in embedded devices).

 */
```

1.2. Part I - Video for Linux API
Linux Media Subsystem Documentation, Release 4.7.0+

* @hfrontporch: Horizontal front porch in pixels
* @hsync: Horizontal Sync length in pixels
* @hbackporch: Horizontal back porch in pixels
* @vfrontporch: Vertical front porch in lines
* @vsync: Vertical Sync length in lines
* @vbackporch: Vertical back porch in lines
* @il_vfrontporch: Vertical front porch for the even field
  (aka field 2) of interlaced field formats
* @il_vsync: Vertical Sync length for the even field
  (aka field 2) of interlaced field formats
* @il_vbackporch: Vertical back porch for the even field
  (aka field 2) of interlaced field formats
* @standards: Standards the timing belongs to
* @flags: Flags
* @reserved: Reserved fields, must be zeroed.

* A note regarding vertical interlaced timings: height refers to the total
  height of the active video frame (= two fields). The blanking timings refer
  to the blanking of each field. So the height of the total frame is
  calculated as follows:

  \[
  \text{tot\_height} = \text{height} + \text{vfrontporch} + \text{vsync} + \text{vbackporch} +
  \text{il\_vfrontporch} + \text{il\_vsync} + \text{il\_vbackporch}
  \]

* The active height of each field is height / 2.

```

1.2.12 Video Grabber example using libv4l

This program demonstrates how to grab V4L2 images in ppm format by using libv4l handlers. The advantage is that this grabber can potentially work with any V4L2 driver.

1.2.14 Revision and Copyright

Authors, in alphabetical order:

- Ailus, Sakari <sakari.ailus@iki.fi>
  - Subdev selections API.
- Carvalho Chehab, Mauro <m.chehab@kernel.org>
  - Documented libv4l, designed and added v4l2grab example, Remote Controller chapter.
- Dirks, Bill
  - Original author of the V4L2 API and documentation.
- H Schimek, Michael <mschimek@gmx.at>
  - Original author of the V4L2 API and documentation.
- Karicheri, Muralidharan <m-karicheri2@ti.com>
  - Documented the Digital Video timings API.
- Osciak, Pawel <pawel@osciak.com>
  - Designed and documented the multi-planar API.
- Palosaari, Antti <crope@iki.fi>
  - SDR API.
- Rubli, Martin
  - Designed and documented the VIDIOC_ENUM_FRAME SIZES and VIDIOC_ENUM_FRAMEINTERVALS ioctls.
- Walls, Andy <awalls@md.metrocast.net>
  - Documented the fielded V4L2_MPEG_STREAM_VBI_FMT_IVTV MPEG stream embedded, sliced VBI data format in this specification.
- Verkuil, Hans <hverkuil@xs4all.nl>
  - Designed and documented the VIDIOC_LOG_STATUS ioctl, the extended control ioctls, major parts of the sliced VBI API, the MPEG encoder and decoder APIs and the DV Timings API.

Except when explicitly stated as GPL, programming examples within this part can be used and distributed without restrictions.

1.2.15 Revision History

revision 4.5 / 2015-10-29 (rr)
Extend VIDIOC_G_EXT_CTRLS; Replace ctrl_class with a new union with ctrl_class and which. Which is used to select the current value of the control or the default value.

revision 4.4 / 2015-05-26 (ap)

**revision** 4.1 / 2015-02-13 (mcc)

Fix documentation for media controller device nodes and add support for DVB device nodes. Add support for Tuner sub-device.

**revision** 3.19 / 2014-12-05 (hv)

Rewrote Colorspace chapter, added new enum `v4l2_ycbcr_encoding` and enum `v4l2_quantization` fields to struct `v4l2_pix_format`, struct `v4l2_pix_format_mplane` and struct `v4l2_mbus_framefmt`.

**revision** 3.17 / 2014-08-04 (lp, hv)

Extended struct `v4l2_pix_format`. Added format flags. Added compound control types and VIDIOC_QUERY_EXT_CTRL.

**revision** 3.15 / 2014-02-03 (hv, ap)

**revision** 3.14 / 2013-11-25 (rr)

Set width and height as unsigned on `v4l2_rect`.

**revision** 3.11 / 2013-05-26 (hv)

Remove obsolete VIDIOC_DBG_G_CHIP_IDENT ioctl.

**revision** 3.10 / 2013-03-25 (hv)

Remove obsolete and unused DV_PRESET ioctls: VIDIOC_G_DV_PRESET, VIDIOC_S_DV_PRESET, VIDIOC_QUERY_DV_PRESET and VIDIOC_ENUM_DV_PRESET. Remove the related v4l2_input/output capability flags V4L2_IN_CAP_PRESETS and V4L2_OUT_CAP_PRESETS. Added VIDIOC_DBG_G_CHIP_INFO.

**revision** 3.9 / 2012-12-03 (sa, sn)

Added timestamp types to `v4l2_buffer`. Added V4L2_EVENT_CTRL_CH_RANGE control event changes flag.

**revision** 3.6 / 2012-07-02 (hv)

Added VIDIOC_ENUM_FREQ_BANDS.

**revision** 3.5 / 2012-05-07 (sa, sn, hv)

**revision** 3.4 / 2012-01-25 (sn)

Added **JPEG compression control class**.

**revision** 3.3 / 2012-01-11 (hv)

Added device_caps field to struct `v4l2_capabilities`.

**revision** 3.2 / 2011-08-26 (hv)

Added V4L2_CTRL_FLAG_VOLATILE.

**revision** 3.1 / 2011-06-27 (mcc, po, hv)
Documented that VIDIOC_QUERYCAP now returns a per-subsystem version instead of a per-driver one.
Standardize an error code for invalid ioctl. Added V4L2_CTRL_TYPE_BITMASK.

**revision** 2.6.39 / 2011-03-01 (mcc, po)

Removed VIDIOC_*_OLD from videodev2.h header and update it to reflect latest changes. Added the multi-planar API.

**revision** 2.6.37 / 2010-08-06 (hv)

Removed obsolete vtx (videotext) API.

**revision** 2.6.33 / 2009-12-03 (mk)

Added documentation for the Digital Video timings API.

**revision** 2.6.32 / 2009-08-31 (mcc)

Now, revisions will match the kernel version where the V4L2 API changes will be used by the Linux Kernel. Also added Remote Controller chapter.

**revision** 0.29 / 2009-08-26 (ev)

Added documentation for string controls and for FM Transmitter controls.

**revision** 0.28 / 2009-08-26 (gl)

Added V4L2_CID_BAND_STOP_FILTER documentation.

**revision** 0.27 / 2009-08-15 (mcc)

Added libv4l and Remote Controller documentation; added v4l2grab and keytable application examples.

**revision** 0.26 / 2009-07-23 (hv)

Finalized the RDS capture API. Added modulator and RDS encoder capabilities. Added support for string controls.

**revision** 0.25 / 2009-01-18 (hv)

Added pixel formats VYUY, NV16 and NV61, and changed the debug ioctls VIDIOC_DBG_G/S_REGISTER and VIDIOC_DBG_G_CHIP_IDENT. Added camera controls V4L2_CID_ZOOM_ABSOLUTE, V4L2_CID_ZOOM_RELATIVE, V4L2_CID_ZOOM_CONTINUOUS and V4L2_CID_PRIVACY.

**revision** 0.24 / 2008-03-04 (mhs)

Added pixel formats Y16 and SBGGR16, new controls and a camera controls class. Removed VIDIOC_G/S_MPEGCOMP.

**revision** 0.23 / 2007-08-30 (mhs)

Fixed a typo in VIDIOC_DBG_G/S_REGISTER. Clarified the byte order of packed pixel formats.

**revision** 0.22 / 2007-08-29 (mhs)

Added the Video Output Overlay interface, new MPEG controls, V4L2_FIELD_INTERLACED_TB and V4L2_FIELD_INTERLACED_BT, VIDIOC_DBG_G/S_REGISTER, VIDIOC_(TRY_)ENCODER_CMD, VIDIOC_G_CHIP_IDENT, VIDIOC_G_ENC_INDEX, new pixel formats. Clarifications in the cropping chapter, about RGB pixel formats, the mmap(), poll(), select(), read() and write() functions. Typographical fixes.

**revision** 0.21 / 2006-12-19 (mhs)

Fixed a link in the VIDIOC_G_EXT_CTRLRS section.

**revision** 0.20 / 2006-11-24 (mhs)

Clarified the purpose of the audioset field in struct v4l2_input and v4l2_output.

**revision** 0.19 / 2006-10-19 (mhs)

Documented V4L2_PIX_FMT_RGB444.

**revision** 0.18 / 2006-10-18 (mhs)
Added the description of extended controls by Hans Verkuil. Linked V4L2_PIX_FMT_MPEG to V4L2_CID_MPEG_STREAM_TYPE.

**revision 0.17 / 2006-10-12 (mhs)**
Corrected V4L2_PIX_FMT_HM12 description.

**revision 0.16 / 2006-10-08 (mhs)**

VIDIOC_ENUM_FRAMESIZES and VIDIQC_ENUM_FRAMEINTERVALS are now part of the API.

**revision 0.15 / 2006-09-23 (mhs)**

Cleaned up the bibliography, added BT.653 and BT.1119. capture.c/start_capturing() for user pointer I/O did not initialize the buffer index. Documented the V4L MPEG and MJPEG VIDTYPES and V4L2_PIX_FMT_SBGGR8. Updated the list of reserved pixel formats. See the history chapter for API changes.

**revision 0.14 / 2006-09-14 (mr)**

Added VIDIQC_ENUM_FRAMESIZES and VIDIQC_ENUM_FRAMEINTERVALS proposal for frame format enumeration of digital devices.

**revision 0.13 / 2006-04-07 (mhs)**

Corrected the description of struct v4l2_window clips. New V4L2_STD_ and V4L2_TUNER_MODE_LANG1_LANG2 defines.

**revision 0.12 / 2006-02-03 (mhs)**

Corrected the description of struct v4l2_captureparm and v4l2_outputparm.

**revision 0.11 / 2006-01-27 (mhs)**

Improved the description of struct v4l2_tuner.

**revision 0.10 / 2006-01-10 (mhs)**

VIDIOC_G_INPUT and VIDIQC_S_PARM clarifications.

**revision 0.9 / 2005-11-27 (mhs)**

Improved the 525 line numbering diagram. Hans Verkuil and I rewrote the sliced VBI section. He also contributed a VIDIQC_LOG_STATUS page. Fixed VIDIQC_S_STD call in the video standard selection example. Various updates.

**revision 0.8 / 2004-10-04 (mhs)**

Somehow a piece of junk slipped into the capture example, removed.

**revision 0.7 / 2004-09-19 (mhs)**

Fixed video standard selection, control enumeration, downsampling and aspect example. Added read and user pointer i/o to video capture example.

**revision 0.6 / 2004-08-01 (mhs)**

v4l2_buffer changes, added video capture example, various corrections.

**revision 0.5 / 2003-11-05 (mhs)**

Pixel format erratum.

**revision 0.4 / 2003-09-17 (mhs)**

Corrected source and Makefile to generate a PDF. SGML fixes. Added latest API changes. Closed gaps in the history chapter.

**revision 0.3 / 2003-02-05 (mhs)**

Another draft, more corrections.

**revision 0.2 / 2003-01-15 (mhs)**

Chapter 1. Linux Media Infrastructure userspace API
1.3 Part II - Digital TV API

Note:
This API is also known as DVB API, although it is generic enough to support all digital TV standards.

Version 5.10
Table of Contents

1.3.1 Introduction

What you need to know

The reader of this document is required to have some knowledge in the area of digital video broadcasting (DVB) and should be familiar with part I of the MPEG2 specification ISO/IEC 13818 (aka ITU-T H.222), i.e you should know what a program/transport stream (PS/TS) is and what is meant by a packetized elementary stream (PES) or an I-frame.

It is also necessary to know how to access unix/linux devices and how to use ioctl calls. This also includes the knowledge of C or C++.

History

The first API for DVB cards we used at Convergence in late 1999 was an extension of the Video4Linux API which was primarily developed for frame grabber cards. As such it was not really well suited to be used for DVB cards and their new features like recording MPEG streams and filtering several section and PES data streams at the same time.

In early 2000, we were approached by Nokia with a proposal for a new standard Linux DVB API. As a commitment to the development of terminals based on open standards, Nokia and Convergence made it available to all Linux developers and published it on https://linuxtv.org in September 2000. Convergence is the maintainer of the Linux DVB API. Together with the LinuxTV community (i.e. you, the reader of this document), the Linux DVB API will be constantly reviewed and improved. With the Linux driver for the Siemens/Hauppauge DVB PCI card Convergence provides a first implementation of the Linux DVB API.

Overview

A DVB PCI card or DVB set-top-box (STB) usually consists of the following main hardware components:

• Frontend consisting of tuner and DVB demodulator

Here the raw signal reaches the DVB hardware from a satellite dish or antenna or directly from cable. The frontend down-converts and demodulates this signal into an MPEG transport stream (TS). In case of a satellite frontend, this includes a facility for satellite equipment control (SEC), which allows control of LNB polarization, multi feed switches or dish rotors.
• Conditional Access (CA) hardware like CI adapters and smartcard slots
  The complete TS is passed through the CA hardware. Programs to which the user has access (controlled by the smart card) are decoded in real time and re-inserted into the TS.

• Demultiplexer which filters the incoming DVB stream
  The demultiplexer splits the TS into its components like audio and video streams. Besides usually several of such audio and video streams it also contains data streams with information about the programs offered in this or other streams of the same provider.

• MPEG2 audio and video decoder
  The main targets of the demultiplexer are the MPEG2 audio and video decoders. After decoding they pass on the uncompressed audio and video to the computer screen or (through a PAL/NTSC encoder) to a TV set.

Components of a DVB card/STB shows a crude schematic of the control and data flow between those components.

On a DVB PCI card not all of these have to be present since some functionality can be provided by the main CPU of the PC (e.g. MPEG picture and sound decoding) or is not needed (e.g. for data-only uses like “internet over satellite”). Also not every card or STB provides conditional access hardware.

Linux DVB Devices

The Linux DVB API lets you control these hardware components through currently six Unix-style character devices for video, audio, frontend, demux, CA and IP-over-DVB networking. The video and audio devices control the MPEG2 decoder hardware, the frontend device the tuner and the DVB demodulator. The demux device gives you control over the PES and section filters of the hardware. If the hardware does not support filtering these filters can be implemented in software. Finally, the CA device controls all the conditional access capabilities of the hardware. It can depend on the individual security requirements of the platform, if and how many of the CA functions are made available to the application through this device.

All devices can be found in the /dev tree under /dev/dvb. The individual devices are called:

• /dev/dvb/adapterN/audioM,
• /dev/dvb/adapterN/videoM,
• /dev/dvb/adapterN/frontendM,
• /dev/dvb/adapterN/netM,
• /dev/dvb/adapterN/demuxM,
• /dev/dvb/adapterN/dvrM,
- `/dev/dvb/adapterN/caM`,

where `N` enumerates the DVB PCI cards in a system starting from 0, and `M` enumerates the devices of each type within each adapter, starting from 0, too. We will omit the “/dev/dvb/adapterN/” in the further discussion of these devices.

More details about the data structures and function calls of all the devices are described in the following chapters.

**API include files**

For each of the DVB devices a corresponding include file exists. The DVB API include files should be included in application sources with a partial path like:

```c
#include <linux/dvb/ca.h>
#include <linux/dvb/dmx.h>
#include <linux/dvb/frontend.h>
#include <linux/dvb/net.h>
```

To enable applications to support different API version, an additional include file `linux/dvb/version.h` exists, which defines the constant `DVB_API_VERSION`. This document describes `DVB_API_VERSION 5.10`.

### 1.3.2 DVB Frontend API

The DVB frontend API was designed to support three types of delivery systems:

- Terrestrial systems: DVB-T, DVB-T2, ATSC, ATSC M/H, ISDB-T, DVB-H, DTMB, CMMB
- Cable systems: DVB-C Annex A/C, ClearQAM (DVB-C Annex B), ISDB-C
- Satellite systems: DVB-S, DVB-S2, DVB Turbo, ISDB-S, DSS

The DVB frontend controls several sub-devices including:

- Tuner
- Digital TV demodulator
- Low noise amplifier (LNA)
- Satellite Equipment Control (SEC) hardware (only for Satellite).

The frontend can be accessed through `/dev/dvb/adapterN/frontend?`. Data types and ioctl definitions can be accessed by including `linux/dvb/frontend.h` in your application.

**Note:**

Transmission via the internet (DVB-IP) is not yet handled by this API but a future extension is possible.

On Satellite systems, the API support for the Satellite Equipment Control (SEC) allows to power control and to send/receive signals to control the antenna subsystem, selecting the polarization and choosing the Intermediate Frequency (IF) of the Low Noise Block Converter Feed Horn (LNBf). It supports the DiSEqC and V-SEC protocols. The DiSEqC (digital SEC) specification is available at [Eutelsat](http://www.eutelsat.com).
Querying frontend information

Usually, the first thing to do when the frontend is opened is to check the frontend capabilities. This is done using `ioctl FE_GET_INFO`. This ioctl will enumerate the DVB API version and other characteristics about the frontend, and can be opened either in read only or read/write mode.

Querying frontend status and statistics

Once `FE_SET_PROPERTY` is called, the frontend will run a kernel thread that will periodically check for the tuner lock status and provide statistics about the quality of the signal.

The information about the frontend tuner locking status can be queried using `ioctl FE_READ_STATUS`. Signal statistics are provided via `ioctl FE_SET_PROPERTY, FE_GET_PROPERTY`.

**Note:**

Most statistics require the demodulator to be fully locked (e.g. with `FE_HAS_LOCK` bit set). See Frontend statistics indicators for more details.

DVB Frontend properties

Tuning into a Digital TV physical channel and starting decoding it requires changing a set of parameters, in order to control the tuner, the demodulator, the Linear Low-noise Amplifier (LNA) and to set the antenna subsystem via Satellite Equipment Control (SEC), on satellite systems. The actual parameters are specific to each particular digital TV standards, and may change as the digital TV specs evolves.

In the past, the strategy used was to have a union with the parameters needed to tune for DVB-S, DVB-C, DVB-T and ATSC delivery systems grouped there. The problem is that, as the second generation standards appeared, those structs were not big enough to contain the additional parameters. Also, the union didn’t have any space left to be expanded without breaking userspace. So, the decision was to deprecate the legacy union/struct based approach, in favor of a properties set approach.

**Note:**

On Linux DVB API version 3, setting a frontend were done via `struct dvb_frontend_parameters`. This got replaced on version 5 (also called “S2API”, as this API were added originally enabled to provide support for DVB-S2), because the old API has a very limited support to new standards and new hardware. This section describes the new and recommended way to set the frontend, with support all digital TV delivery systems.

Example: with the properties based approach, in order to set the tuner to a DVB-C channel at 651 kHz, modulated with 256-QAM, FEC 3/4 and symbol rate of 5.217 Mbauds, those properties should be sent to `FE_SET_PROPERTY` ioctl:

- `DTV_DELIVERY_SYSTEM` = SYS_DVBC_ANNEX_A
- `DTV_FREQUENCY` = 651000000
- `DTV_MODULATION` = QAM_256
- `DTV_INVERSION` = INVERSION_AUTO
- `DTV_SYMBOL_RATE` = 5217000
- `DTV_INNER_FEC` = FEC_3_4
- `DTV_TUNE`
The code that would do the above is shown in Example: Setting digital TV frontend properties.

Example: Setting digital TV frontend properties

```c
#include <stdio.h>
#include <fcntl.h>
#include <sys/ioctl.h>
#include <linux/dvb/frontend.h>

static struct dtv_property props[] = {
    { .cmd = DTV_DELIVERY_SYSTEM, .u.data = SYS_DVBC_ANNEX_A },
    { .cmd = DTV_FREQUENCY, .u.data = 65100000 },
    { .cmd = DTV_MODULATION, .u.data = QAM_256 },
    { .cmd = DTV_INVERSION, .u.data = INVERSION_AUTO },
    { .cmd = DTV_SYMBOL_RATE, .u.data = 5217000 },
    { .cmd = DTV_INNER_FEC, .u.data = FEC_3_4 },
    { .cmd = DTV_TUNE }
};

static struct dtv_properties dtv_prop = {
    .num = 6, .props = props
};

int main(void)
{
    int fd = open("/dev/dvb/adapter0/frontend0", O_RDWR);
    if (!fd) {
        perror("open");
        return -1;
    }
    if (ioctl(fd, FE_SET_PROPERTY, &dtv_prop) == -1) {
        perror("ioctl");
        return -1;
    }
    printf("Frontend set\n");
    return 0;
}
```

Attention:

While it is possible to directly call the Kernel code like the above example, it is strongly recommended to use libdvbv5, as it provides abstraction to work with the supported digital TV standards and provides methods for usual operations like program scanning and to read/write channel descriptor files.

struct dtv_stats

```c
struct dtv_stats {
    u8 scale; /* enum fecap_scale_params type */
    union {
        __u64 uvalue; /* for counters and relative scales */
        __s64 svalue; /* for 1/1000 dB measures */
    }
};
```

1.3. Part II - Digital TV API
struct dtv_fe_stats

#define MAX_DTV_STATS 4
struct dtv_fe_stats {
    __u8 len;
    struct dtv_stats stat[MAX_DTV_STATS];
} __packed;

struct dtv_property

/* Reserved fields should be set to 0 */
struct dtv_property {
    __u32 cmd;
    __u32 reserved[3];
    union {
        __u32 data;
        struct dtv_fe_stats st;
        struct {
            __u8 data[32];
            __u32 len;
            __u32 reserved1[3];
            void *reserved2;
        } buffer;
    } u;
    int result;
} __attribute__((packed));

/* num of properties cannot exceed DTV_IOCTL_MAX_MSGS per ioctl */
#define DTV_IOCTL_MAX_MSGS 64

struct dtv_properties

struct dtv_properties {
    __u32 num;
    struct dtv_property *props;
};

Property types

On `FE_GET_PROPERTY` and `FE_SET_PROPERTY`, the actual action is determined by the dtv_property cmd/data pairs. With one single ioctl, it is possible to get/set up to 64 properties. The actual meaning of each property is described on the next sections.

The available frontend property types are shown on the next section.

Digital TV property parameters

DTV_UNDEFINED

Used internally. A GET/SET operation for it won’t change or return anything.
**DTV_TUNE**

Interpret the cache of data, build either a traditional frontend tunerequest so we can pass validation in the FE_SET_FRONTEND ioctl.

**DTV_CLEAR**

Reset a cache of data specific to the frontend here. This does not effect hardware.

**DTV_FREQUENCY**

Frequency of the digital TV transponder/channel.

**Note:**

1. For satellite delivery systems, the frequency is in kHz.
2. For cable and terrestrial delivery systems, the frequency is in Hz.
3. On most delivery systems, the frequency is the center frequency of the transponder/channel. The exception is for ISDB-T, where the main carrier has a 1/7 offset from the center.
4. For ISDB-T, the channels are usually transmitted with an offset of about 143kHz. E.g. a valid frequency could be 474,143 kHz. The stepping is bound to the bandwidth of the channel which is typically 6MHz.
5. In ISDB-Tsb, the channel consists of only one or three segments the frequency step is 429kHz, 3*429 respectively.

**DTV_MODULATION**

Specifies the frontend modulation type for delivery systems that supports more than one modulation type. The modulation can be one of the types defined by enum `fe_modulation`.

**Modulation property**

Most of the digital TV standards currently offers more than one possible modulation (sometimes called as “constellation” on some standards). This enum contains the values used by the Kernel. Please note that not all modulations are supported by a given standard.
### Table 1.159: enum fe_modulation

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>

<tr>
<td>QAM_4_NR</td>
<td>4-QAM-NR modulation</td>
</tr>
</tbody>
</table>

### DTV_BANDWIDTH_HZ

Bandwidth for the channel, in HZ.

Possible values: 1712000, 5000000, 6000000, 7000000, 8000000, 10000000.

**Note:**

1. DVB-T supports 6, 7 and 8MHz.
2. DVB-T2 supports 1.172, 5, 6, 7, 8 and 10MHz.
3. ISDB-T supports 5MHz, 6MHz, 7MHz and 8MHz, although most places use 6MHz.
4. On DVB-C and DVB-S/S2, the bandwidth depends on the symbol rate. So, the Kernel will silently ignore setting DTV_BANDWIDTH_HZ.
5. For DVB-C and DVB-S/S2, the Kernel will return an estimation of the bandwidth, calculated from DTV_SYMBOL_RATE and from the rolloff, with is fixed for DVB-C and DVB-S.
6. For DVB-S2, the bandwidth estimation will use DTV_ROLLOFF.
7. For ISDB-Tsb, it can vary depending on the number of connected segments.
8. Bandwidth in ISDB-Tsb can be easily derived from other parameters (DTV_ISDBT_SB_SEGMENT_IDX, DTV_ISDBT_SB_SEGMENT_COUNT).

### DTV_INVERSION

Specifies if the frontend should do spectral inversion or not.
enum fe_modulation: Frontend spectral inversion

This parameter indicates if spectral inversion should be presumed or not. In the automatic setting (INVERSION_AUTO) the hardware will try to figure out the correct setting by itself. If the hardware doesn’t support, the DVB core will try to lock at the carrier first with inversion off. If it fails, it will try to enable inversion.

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVERSION_OFF</td>
<td>Don’t do spectral band inversion.</td>

</tr>
</tbody>
</table>

DTV_DISEQC_MASTER

Currently not implemented.

DTV_SYMBOL_RATE

Digital TV symbol rate, in bauds (symbols/second). Used on cable standards.

DTV_INNER_FEC

Used cable/satellite transmissions. The acceptable values are:
enum fe_code_rate: type of the Forward Error Correction.

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FEC_NONE</td>
<td>No Forward Error Correction Code</td>

</table>

**DTV_ISDBT_PARTIAL_RECEPTION**

If DTV_ISDBT_SOUND_BROADCASTING is ‘0’ this bit-field represents whether the channel is in partial reception mode or not.

If ‘1’ DTV_ISDBT_LAYERA_* values are assigned to the center segment and DTV_ISDBT_LAYERA_SEGMENT_COUNT has to be ‘1’.

If in addition DTV_ISDBT_SOUND_BROADCASTING is ‘1’ DTV_ISDBT_PARTIAL_RECEPTION represents whether this ISDB-Tsb channel is consisting of one segment and layer or three segments and two layers.

Possible values: 0, 1, -1 (AUTO)

**DTV_ISDBT_SOUND_BROADCASTING**

This field represents whether the other DTV_ISDBT_*-parameters are referring to an ISDB-T and an ISDB-Tsb channel. (See also DTV_ISDBT_PARTIAL_RECEPTION).

Possible values: 0, 1, -1 (AUTO)
**DTV_ISDBT_SB_SUBCHANNEL_ID**

This field only applies if DTV_ISDBT_SOUND_BROADCASTING is ‘1’.

(Note of the author: This might not be the correct description of the SUBCHANNEL-ID in all details, but it is my understanding of the technical background needed to program a device)

An ISDB-Tsb channel (1 or 3 segments) can be broadcasted alone or in a set of connected ISDB-Tsb channels. In this set of channels every channel can be received independently. The number of connected ISDB-Tsb segment can vary, e.g. depending on the frequency spectrum bandwidth available.

Example: Assume 8 ISDB-Tsb connected segments are broadcasted. The broadcaster has several possibilities to put those channels in the air: Assuming a normal 13-segment ISDB-T spectrum he can align the 8 segments from position 1-8 to 5-13 or anything in between.

The underlying layer of segments are subchannels: each segment is consisting of several subchannels with a predefined IDs. A sub-channel is used to help the demodulator to synchronize on the channel.

An ISDB-T channel is always centered over all sub-channels. As for the example above, in ISDB-Tsb it is no longer as simple as that.

The **DTV_ISDBT_SB_SUBCHANNEL_ID** parameter is used to give the sub-channel ID of the segment to be demodulated.

Possible values: 0 .. 41, -1 (AUTO)

**DTV_ISDBT_SB_SEGMENT_IDX**

This field only applies if DTV_ISDBT_SOUND_BROADCASTING is ‘1’.

**DTV_ISDBT_SB_SEGMENT_IDX** gives the index of the segment to be demodulated for an ISDB-Tsb channel where several of them are transmitted in the connected manner.

Possible values: 0 .. **DTV_ISDBT_SB_SEGMENT_COUNT** - 1

Note: This value cannot be determined by an automatic channel search.

**DTV_ISDBT_SB_SEGMENT_COUNT**

This field only applies if DTV_ISDBT_SOUND_BROADCASTING is ‘1’.

**DTV_ISDBT_SB_SEGMENT_COUNT** gives the total count of connected ISDB-Tsb channels.

Possible values: 1 .. 13

Note: This value cannot be determined by an automatic channel search.

**DTV-ISDBT-LAYER[A-C] parameters**

ISDB-T channels can be coded hierarchically. As opposed to DVB-T in ISDB-T hierarchical layers can be decoded simultaneously. For that reason a ISDB-T demodulator has 3 Viterbi and 3 Reed-Solomon decoders.

ISDB-T has 3 hierarchical layers which each can use a part of the available segments. The total number of segments over all layers has to 13 in ISDB-T.

There are 3 parameter sets, for Layers A, B and C.
Hierarchical reception in ISDB-T is achieved by enabling or disabling layers in the decoding process. Setting all bits of `DTV_ISDBT_LAYER_ENABLED` to `1` forces all layers (if applicable) to be demodulated. This is the default.

If the channel is in the partial reception mode (`DTV_ISDBT_PARTIAL_RECEPTION = 1`) the central segment can be decoded independently of the other 12 segments. In that mode layer A has to have a `SEGMENT_COUNT` of 1.

In ISDB-Tsb only layer A is used, it can be 1 or 3 in ISDB-Tsb according to `DTV_ISDBT_PARTIAL_RECEPTION`. `SEGMENT_COUNT` must be filled accordingly.

Only the values of the first 3 bits are used. Other bits will be silently ignored:

- `DTV_ISDBT_LAYER_ENABLED` bit 0: layer A enabled
- `DTV_ISDBT_LAYER_ENABLED` bit 1: layer B enabled
- `DTV_ISDBT_LAYER_ENABLED` bit 2: layer C enabled
- `DTV_ISDBT_LAYER_ENABLED` bits 3-31: unused

### `DTV_ISDBT_LAYER[A-C]_FEC`

Possible values: `FEC_AUTO`, `FEC_1_2`, `FEC_2_3`, `FEC_3_4`, `FEC_5_6`, `FEC_7_8`

### `DTV_ISDBT_LAYER[A-C]_MODULATION`

Possible values: `QAM_AUTO`, `QPSK`, `QAM_16`, `QAM_64`, `DQPSK`

Note: If layer C is DQPSK layer B has to be DQPSK. If layer B is DQPSK and `DTV_ISDBT_PARTIAL_RECEPTION=0` layer has to be DQPSK.

### `DTV_ISDBT_LAYER[A-C]_SEGMENT_COUNT`

Possible values: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, -1 (AUTO)

Note: Truth table for `DTV_ISDBT_SOUND_BROADCASTING` and `DTV_ISDBT_PARTIAL_RECEPTION` and `LAYER[A-C]_SEGMENT_COUNT`

**DTV_ATSCMH_FIC_VER**

Version number of the FIC (Fast Information Channel) signaling data.

FIC is used for relaying information to allow rapid service acquisition by the receiver.

Possible values: 0, 1, 2, 3, ..., 30, 31

**DTV_ATSCMH_PARADE_ID**

Parade identification number

A parade is a collection of up to eight MH groups, conveying one or two ensembles.

Possible values: 0, 1, 2, 3, ..., 126, 127

**DTV_ATSCMH_NOG**

Number of MH groups per MH subframe for a designated parade.

Possible values: 1, 2, 3, 4, 5, 6, 7, 8

**DTV_ATSCMH_TNOG**

Total number of MH groups including all MH groups belonging to all MH parades in one MH subframe.

Possible values: 0, 1, 2, 3, ..., 30, 31

**DTV_ATSCMH_SGN**

Start group number.

Possible values: 0, 1, 2, 3, ..., 14, 15

**DTV_ATSCMH_PRC**

Parade repetition cycle.

Possible values: 1, 2, 3, 4, 5, 6, 7, 8

**DTV_ATSCMH_RS_FRAME_MODE**

Reed Solomon (RS) frame mode.

Possible values are:
Table 1.168: enum atscmh_rs_frame_mode

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATSCMH_RSFRAME_PRI_ONLY</td>
<td>Single Frame: There is only a primary RS Frame for all Group Regions.</td>
</tr>
<tr>
<td>ATSCMH_RSFRAME_PRI_SEC</td>
<td>Dual Frame: There are two separate RS Frames: Primary RS Frame for Group Region A and B and Secondary RS Frame for Group Region C and D.</td>
</tr>
</tbody>
</table>

DTV_ATSCMH_RS_FRAME_ENSEMBLE

Reed Solomon(RS) frame ensemble.
Possible values are:

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATSCMH_RSFRAME_ENS_PRI</td>
<td>Primary Ensemble.</td>
</tr>
<tr>
<td>AATSCMH_RSFRAME_PRI_SEC</td>
<td>Secondary Ensemble.</td>
</tr>
<tr>
<td>AATSCMH_RSFRAME_RES</td>
<td>Reserved. Shouldn’t be used.</td>
</tr>
</tbody>
</table>

DTV_ATSCMH_RS_CODE_MODE_PRI

Reed Solomon (RS) code mode (primary).
Possible values are:

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATSCMH_RSCODE_211_187</td>
<td>Reed Solomon code (211,187).</td>
</tr>
<tr>
<td>ATSCMH_RSCODE_223_187</td>
<td>Reed Solomon code (223,187).</td>
</tr>
<tr>
<td>ATSCMH_RSCODE_235_187</td>
<td>Reed Solomon code (235,187).</td>
</tr>
<tr>
<td>ATSCMH_RSCODE_RES</td>
<td>Reserved. Shouldn’t be used.</td>
</tr>
</tbody>
</table>

DTV_ATSCMH_RS_CODE_MODE_SEC

Reed Solomon (RS) code mode (secondary).
Possible values are the same as documented on enum atscmh_rs_code_mode:

DTV_ATSCMH_SCCC_BLOCK_MODE

Series Concatenated Convolutional Code Block Mode.
Possible values are:
Table 1.171: enum atscmh_scc_block_mode

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATSCMH_SCCC_BLK_SEP</td>
<td>Separate SCCC: the SCCC outer code mode shall be set independently for each Group Region (A, B, C, D)</td>
</tr>
<tr>
<td>ATSCMH_SCCC_BLK_COMB</td>
<td>Combined SCCC: all four Regions shall have the same SCCC outer code mode.</td>
</tr>
<tr>
<td>ATSCMH_SCCC_BLK_RES</td>
<td>Reserved. Shouldn’t be used.</td>
</tr>
</tbody>
</table>

**DTV_ATSCMH_SCCC_CODE_MODE_A**

Series Concatenated Convolutional Code Rate.

Possible values are:

Table 1.172: enum atscmh_sccc_code_mode

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATSCMH_SCCC_CODE_HLF</td>
<td>The outer code rate of a SCCC Block is 1/2 rate.</td>
</tr>
<tr>
<td>ATSCMH_SCCC_CODE_QTR</td>
<td>The outer code rate of a SCCC Block is 1/4 rate.</td>
</tr>
<tr>
<td>ATSCMH_SCCC_CODE_RES</td>
<td>to be documented.</td>
</tr>
</tbody>
</table>

**DTV_ATSCMH_SCCC_CODE_MODE_B**

Series Concatenated Convolutional Code Rate.

Possible values are the same as documented on enum `atscmh_sccc_code_mode`.

**DTV_ATSCMH_SCCC_CODE_MODE_C**

Series Concatenated Convolutional Code Rate.

Possible values are the same as documented on enum `atscmh_sccc_code_mode`.

**DTV_ATSCMH_SCCC_CODE_MODE_D**

Series Concatenated Convolutional Code Rate.

Possible values are the same as documented on enum `atscmh_sccc_code_mode`.

**DTV_API_VERSION**

Returns the major/minor version of the DVB API

**DTV_CODE_RATE_HP**

Used on terrestrial transmissions. The acceptable values are the ones described at `fe_transmit_mode_t`. 

---

1.3. Part II - Digital TV API
**DTV_CODE_RATE_LP**

Used on terrestrial transmissions. The acceptable values are the ones described at `fe_transmit_mode_t`.

**DTV_GUARD_INTERVAL**

Possible values are:

Modulation guard interval

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GUARD_INTERVAL_AUTO</td>
<td>Autodetect the guard interval</td>
</tr>
<tr>
<td>GUARD_INTERVAL_1_128</td>
<td>Guard interval 1/128</td>
</tr>
<tr>
<td>GUARD_INTERVAL_1_32</td>
<td>Guard interval 1/32</td>
</tr>
<tr>
<td>GUARD_INTERVAL_1_16</td>
<td>Guard interval 1/16</td>
</tr>
<tr>
<td>GUARD_INTERVAL_1_8</td>
<td>Guard interval 1/8</td>
</tr>
<tr>
<td>GUARD_INTERVAL_1_4</td>
<td>Guard interval 1/4</td>
</tr>
<tr>
<td>GUARD_INTERVAL_19_128</td>
<td>Guard interval 19/128</td>
</tr>
<tr>
<td>GUARD_INTERVAL_19_256</td>
<td>Guard interval 19/256</td>
</tr>
<tr>
<td>GUARD_INTERVAL_PN420</td>
<td>PN length 420 (1/4)</td>
</tr>
<tr>
<td>GUARD_INTERVAL_PN595</td>
<td>PN length 595 (1/6)</td>
</tr>
<tr>
<td>GUARD_INTERVAL_PN945</td>
<td>PN length 945 (1/9)</td>
</tr>
</tbody>
</table>

Notes:
1) If `DTV_GUARD_INTERVAL` is set the `GUARD_INTERVAL_AUTO` the hardware will try to find the correct guard interval (if capable) and will use TMCC to fill in the missing parameters.
2) Intervals 1/128, 19/128 and 19/256 are used only for DVB-T2 at present.
3) DTMB specifies PN420, PN595 and PN945.

**DTV_TRANSMISSION_MODE**

Specifies the number of carriers used by the standard. This is used only on OFTM-based standards, e.g. DVB-T/T2, ISDB-T, DTMB.
enum fe_transmit_mode: Number of carriers per channel

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSMISSION_MODE_AUTO</td>
<td>Autodetect transmission mode. The hardware will try to find the correct FFT-size (if capable) to fill in the missing parameters.</td>
</tr>
<tr>
<td>TRANSMISSION_MODE_1K</td>
<td>Transmission mode 1K</td>
</tr>
<tr>
<td>TRANSMISSION_MODE_2K</td>
<td>Transmission mode 2K</td>
</tr>
<tr>
<td>TRANSMISSION_MODE_8K</td>
<td>Transmission mode 8K</td>
</tr>
<tr>
<td>TRANSMISSION_MODE_4K</td>
<td>Transmission mode 4K</td>
</tr>
<tr>
<td>TRANSMISSION_MODE_16K</td>
<td>Transmission mode 16K</td>
</tr>
<tr>
<td>TRANSMISSION_MODE_32K</td>
<td>Transmission mode 32K</td>
</tr>
<tr>
<td>TRANSMISSION_MODE_C1</td>
<td>Single Carrier (C=1) transmission mode (DTMB)</td>
</tr>
<tr>
<td>TRANSMISSION_MODE_C3780</td>
<td>Multi Carrier (C=3780) transmission mode (DTMB)</td>
</tr>
</tbody>
</table>

Notes:
1) ISDB-T supports three carrier/symbol-size: 8K, 4K, 2K. It is called ‘mode’ in the standard: Mode 1 is 2K, mode 2 is 4K, mode 3 is 8K
2) If DTV_TRANSMISSION_MODE is set the TRANSMISSION_MODE_AUTO the hardware will try to find the correct FFT-size (if capable) and will use TMCC to fill in the missing parameters.
3. DVB-T specifies 2K and 8K as valid sizes.
4. DVB-T2 specifies 1K, 2K, 4K, 8K, 16K and 32K.
5. DTMB specifies C1 and C3780.

DTV_HIERARCHY

Frontend hierarchy

Frontend hierarchy

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HIERARCHY_NONE</td>
<td>No hierarchy</td>
</tr>
<tr>
<td>HIERARCHY_AUTO</td>
<td>Autodetect hierarchy (if supported)</td>
</tr>
<tr>
<td>HIERARCHY_1</td>
<td>Hierarchy 1</td>
</tr>
<tr>
<td>HIERARCHY_2</td>
<td>Hierarchy 2</td>
</tr>
<tr>
<td>HIERARCHY_4</td>
<td>Hierarchy 4</td>
</tr>
</tbody>
</table>
DTV_STREAM_ID

DVB-S2, DVB-T2 and ISDB-S support the transmission of several streams on a single transport stream. This property enables the DVB driver to handle substream filtering, when supported by the hardware. By default, substream filtering is disabled.

For DVB-S2 and DVB-T2, the valid substream id range is from 0 to 255.
For ISDB, the valid substream id range is from 1 to 65535.
To disable it, you should use the special macro NO_STREAM_ID_FILTER.
Note: any value outside the id range also disables filtering.

DTV_DVBT2_PLP_ID_LEGACY

Obsolete, replaced with DTV_STREAM_ID.

DTV_ENUM_DELSYS

A Multi standard frontend needs to advertise the delivery systems provided. Applications need to enumerate the provided delivery systems, before using any other operation with the frontend. Prior to it’s introduction, FE_GET_INFO was used to determine a frontend type. A frontend which provides more than a single delivery system, FE_GET_INFO doesn’t help much. Applications which intends to use a multi-standard frontend must enumerate the delivery systems associated with it, rather than trying to use FE_GET_INFO. In the case of a legacy frontend, the result is just the same as with FE_GET_INFO, but in a more structured format

DTV_INTERLEAVING

Time interleaving to be used. Currently, used only on DTMB.

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTERLEAVING_NONE</td>
<td>No interleaving.</td>
</tr>
<tr>
<td>INTERLEAVING_AUTO</td>
<td>Auto-detect interleaving.</td>
</tr>
<tr>
<td>INTERLEAVING_240</td>
<td>Interleaving of 240 symbols.</td>
</tr>
<tr>
<td>INTERLEAVING_720</td>
<td>Interleaving of 720 symbols.</td>
</tr>
</tbody>
</table>

DTV_LNA

Low-noise amplifier.
Hardware might offer controllable LNA which can be set manually using that parameter. Usually LNA could be found only from terrestrial devices if at all.
Possible values: 0, 1, LNA_AUTO
0, LNA off
1, LNA on
use the special macro LNA_AUTO to set LNA auto
Frontend statistics indicators

The values are returned via `dtv_property.stat`. If the property is supported, `dtv_property.stat.len` is bigger than zero.

For most delivery systems, `dtv_property.stat.len` will be 1 if the stats is supported, and the properties will return a single value for each parameter.

It should be noted, however, that new OFDM delivery systems like ISDB can use different modulation types for each group of carriers. On such standards, up to 3 groups of statistics can be provided, and `dtv_property.stat.len` is updated to reflect the “global” metrics, plus one metric per each carrier group (called “layer” on ISDB).

So, in order to be consistent with other delivery systems, the first value at `dtv_property.stat.dtv_stats` array refers to the global metric. The other elements of the array represent each layer, starting from layer A(index 1), layer B (index 2) and so on.

The number of filled elements are stored at `dtv_property.stat.len`.

Each element of the `dtv_property.stat.dtv_stats` array consists on two elements:

- `svalue` or `uvalue`, where `svalue` is for signed values of the measure (dB measures) and `uvalue` is for unsigned values (counters, relative scale)
- `scale` - Scale for the value. It can be:
  - `FE_SCALE_NOT_AVAILABLE` - The parameter is supported by the frontend, but it was not possible to collect it (could be a transitory or permanent condition)
  - `FE_SCALE_DECIBEL` - parameter is a signed value, measured in 1/1000 dB
  - `FE_SCALE_RELATIVE` - parameter is a unsigned value, where 0 means 0% and 65535 means 100%.
  - `FE_SCALE_COUNTER` - parameter is a unsigned value that counts the occurrence of an event, like bit error, block error, or lapsed time.

DTV_STAT_SIGNAL_STRENGTH

Indicates the signal strength level at the analog part of the tuner or of the demod.

Possible scales for this metric are:

- `FE_SCALE_NOT_AVAILABLE` - it failed to measure it, or the measurement was not complete yet.
- `FE_SCALE_DECIBEL` - signal strength is in 0.001 dBm units, power measured in miliwatts. This value is generally negative.
- `FE_SCALE_RELATIVE` - The frontend provides a 0% to 100% measurement for power (actually, 0 to 65535).

DTV_STAT_CNR

Indicates the Signal to Noise ratio for the main carrier.

Possible scales for this metric are:

- `FE_SCALE_NOT_AVAILABLE` - it failed to measure it, or the measurement was not complete yet.
- `FE_SCALE_DECIBEL` - Signal/Noise ratio is in 0.001 dB units.
- `FE_SCALE_RELATIVE` - The frontend provides a 0% to 100% measurement for Signal/Noise (actually, 0 to 65535).
DTV_STAT_PRE_ERROR_BIT_COUNT

Measures the number of bit errors before the forward error correction (FEC) on the inner coding block (before Viterbi, LDPC or other inner code).

This measure is taken during the same interval as DTV_STAT_PRE_TOTAL_BIT_COUNT.

In order to get the BER (Bit Error Rate) measurement, it should be divided by DTV_STAT_PRE_TOTAL_BIT_COUNT.

This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:

- FE_SCALE_NOT_AVAILABLE - it failed to measure it, or the measurement was not complete yet.
- FE_SCALE_COUNTER - Number of error bits counted before the inner coding.

DTV_STAT_PRE_TOTAL_BIT_COUNT

Measures the amount of bits received before the inner code block, during the same period as DTV_STAT_PRE_ERROR_BIT_COUNT measurement was taken.

It should be noted that this measurement can be smaller than the total amount of bits on the transport stream, as the frontend may need to manually restart the measurement, losing some data between each measurement interval.

This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:

- FE_SCALE_NOT_AVAILABLE - it failed to measure it, or the measurement was not complete yet.
- FE_SCALE_COUNTER - Number of bits counted while measuring DTV_STAT_PRE_ERROR_BIT_COUNT.

DTV_STAT_POST_ERROR_BIT_COUNT

Measures the number of bit errors after the forward error correction (FEC) done by inner code block (after Viterbi, LDPC or other inner code).

This measure is taken during the same interval as DTV_STAT_POST_TOTAL_BIT_COUNT.

In order to get the BER (Bit Error Rate) measurement, it should be divided by DTV_STAT_POST_TOTAL_BIT_COUNT.

This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:

- FE_SCALE_NOT_AVAILABLE - it failed to measure it, or the measurement was not complete yet.
- FE_SCALE_COUNTER - Number of error bits counted after the inner coding.

DTV_STAT_POST_TOTAL_BIT_COUNT

Measures the amount of bits received after the inner coding, during the same period as DTV_STAT_POST_ERROR_BIT_COUNT measurement was taken.

It should be noted that this measurement can be smaller than the total amount of bits on the transport stream, as the frontend may need to manually restart the measurement, losing some data between each measurement interval.
This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:

- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_COUNTER** - Number of bits counted while measuring `DTV_STAT_POST_ERROR_BIT_COUNT`.

**DTV_STAT_ERROR_BLOCK_COUNT**

Measures the number of block errors after the outer forward error correction coding (after Reed-Solomon or other outer code).

This measurement is monotonically increased, as the frontend gets more bit count measurements. The frontend may reset it when a channel/transponder is tuned.

Possible scales for this metric are:

- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_COUNTER** - Number of error blocks counted after the outer coding.

**DTV-STAT_TOTAL_BLOCK_COUNT**

Measures the total number of blocks received during the same period as `DTV_STAT_ERROR_BLOCK_COUNT` measurement was taken.

It can be used to calculate the PER indicator, by dividing `DTV_STAT_ERROR_BLOCK_COUNT` by `DTV-STAT_TOTAL_BLOCK_COUNT`.

Possible scales for this metric are:

- **FE_SCALE_NOT_AVAILABLE** - it failed to measure it, or the measurement was not complete yet.
- **FE_SCALE_COUNTER** - Number of blocks counted while measuring `DTV_STAT_ERROR_BLOCK_COUNT`.

**Properties used on terrestrial delivery systems**

**DVB-T delivery system**

The following parameters are valid for DVB-T:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_MODULATION`
- `DTV_BANDWIDTH_HZ`
- `DTV_INVERSION`
- `DTV_CODE_RATE_HP`
- `DTV_CODE_RATE_LP`
- `DTV_GUARD_INTERVAL`
**DTV_TRANSMISSION_MODE**
**DTV_HIERARCHY**
**DTV_LNA**

In addition, the **DTV QoS statistics** are also valid.

**DVB-T2 delivery system**

DVB-T2 support is currently in the early stages of development, so expect that this section may grow and become more detailed with time.

The following parameters are valid for DVB-T2:

- **DTV_API_VERSION**
- **DTV_DELIVERY_SYSTEM**
- **DTV_TUNE**
- **DTV_CLEAR**
- **DTV_FREQUENCY**
- **DTV_MODULATION**
- **DTV_BANDWIDTH_HZ**
- **DTV_INVERSION**
- **DTV_CODE_RATE_HP**
- **DTV_CODE_RATE_LP**
- **DTV_GUARD_INTERVAL**
- **DTV_TRANSMISSION_MODE**
- **DTV_HIERARCHY**
- **DTV_STREAM_ID**
- **DTV_LNA**

In addition, the **DTV QoS statistics** are also valid.

**ISDB-T delivery system**

This ISDB-T/ISDB-Tsb API extension should reflect all information needed to tune any ISDB-T/ISDB-Tsb hardware. Of course it is possible that some very sophisticated devices won’t need certain parameters to tune.

The information given here should help application writers to know how to handle ISDB-T and ISDB-Tsb hardware using the Linux DVB-API.

The details given here about ISDB-T and ISDB-Tsb are just enough to basically show the dependencies between the needed parameter values, but surely some information is left out. For more detailed information see the following documents:

ARIB STD-B31 - “Transmission System for Digital Terrestrial Television Broadcasting” and
ARIB TR-B14 - “Operational Guidelines for Digital Terrestrial Television Broadcasting”.

In order to understand the ISDB specific parameters, one has to have some knowledge the channel structure in ISDB-T and ISDB-Tsb. I.e. it has to be known to the reader that an ISDB-T channel consists of 13 segments, that it can have up to 3 layer sharing those segments, and things like that.

The following parameters are valid for ISDB-T:
Linux Media Subsystem Documentation, Release 4.7.0+

- DTV_API_VERSION
- DTV_DELIVERY_SYSTEM
- DTV_TUNE
- DTV_CLEAR
- DTV_FREQUENCY
- DTV_BANDWIDTH_HZ
- DTV_INVERSION
- DTV_GUARD_INTERVAL
- DTV_TRANSMISSION_MODE
- DTV_ISDBT_LAYER_ENABLED
- DTV_ISDBT_PARTIAL_RECEPTION
- DTV_ISDBT_SOUND_BROADCASTING
- DTV_ISDBT_SB_SUBCHANNEL_ID
- DTV_ISDBT_SB_SEGMENTIDX
- DTV_ISDBT_SB_SEGMENT_COUNT
- DTV_ISDBT_LAYERA_FEC
- DTV_ISDBT_LAYERA_MODULATION
- DTV_ISDBT_LAYERA_SEGMENT_COUNT
- DTV_ISDBT_LAYERA_TIME_INTERLEAVING
- DTV_ISDBT_LAYERB_FEC
- DTV_ISDBT_LAYERB_MODULATION
- DTV_ISDBT_LAYERB_SEGMENT_COUNT
- DTV_ISDBT_LAYERB_TIME_INTERLEAVING
- DTV_ISDBT_LAYERC_FEC
- DTV_ISDBT_LAYERC_MODULATION
- DTV_ISDBT_LAYERC_SEGMENT_COUNT
- DTV_ISDBT_LAYERC_TIME_INTERLEAVING

In addition, the **DTV QoS statistics** are also valid.

**ATSC delivery system**

The following parameters are valid for ATSC:

- DTV_API_VERSION
- DTV_DELIVERY_SYSTEM
- DTV_TUNE
- DTV_CLEAR
- DTV_FREQUENCY
- DTV_MODULATION
- DTV_BANDWIDTH_HZ

In addition, the **DTV QoS statistics** are also valid.
ATSC-MH delivery system

The following parameters are valid for ATSC-MH:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_BANDWIDTH_HZ`
- `DTV_ATSCMH_FIC_VER`
- `DTV_ATSCMH_PARADE_ID`
- `DTV_ATSCMH_NOG`
- `DTV_ATSCMH_TNOG`
- `DTV_ATSCMH_SGN`
- `DTV_ATSCMH_PRC`
- `DTV_ATSCMH_RS_FRAME_MODE`
- `DTV_ATSCMH_RS_FRAME_ENSEMBLE`
- `DTV_ATSCMH_RS_CODE_MODE_PRI`
- `DTV_ATSCMH_RS_CODE_MODE_SEC`
- `DTV_ATSCMH_SCCC_BLOCK_MODE`
- `DTV_ATSCMH_SCCC_CODE_MODE_A`
- `DTV_ATSCMH_SCCC_CODE_MODE_B`
- `DTV_ATSCMH_SCCC_CODE_MODE_C`
- `DTV_ATSCMH_SCCC_CODE_MODE_D`

In addition, the `DTV QoS statistics` are also valid.

DTMB delivery system

The following parameters are valid for DTMB:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_MODULATION`
- `DTV_BANDWIDTH_HZ`
- `DTV_INVERSION`
- `DTV_INNER_FEC`
- `DTV_GUARD_INTERVAL`
- `DTV_TRANSMISSION_MODE`
• DTV_INTERLEAVING
• DTV_LNA

In addition, the DTV QoS statistics are also valid.

Properties used on cable delivery systems

DVB-C delivery system

The DVB-C Annex-A is the widely used cable standard. Transmission uses QAM modulation.
The DVB-C Annex-C is optimized for 6MHz, and is used in Japan. It supports a subset of the Annex A modulation types, and a roll-off of 0.13, instead of 0.15

The following parameters are valid for DVB-C Annex A/C:
• DTV_API_VERSION
• DTV_DELIVERY_SYSTEM
• DTV_TUNE
• DTV_CLEAR
• DTV_FREQUENCY
• DTV_MODULATION
• DTV_INVERSION
• DTV_SYMBOL_RATE
• DTV_INNER_FEC
• DTV_LNA

In addition, the DTV QoS statistics are also valid.

DVB-C Annex B delivery system

The DVB-C Annex-B is only used on a few Countries like the United States.
The following parameters are valid for DVB-C Annex B:
• DTV_API_VERSION
• DTV_DELIVERY_SYSTEM
• DTV_TUNE
• DTV_CLEAR
• DTV_FREQUENCY
• DTV_MODULATION
• DTV_INVERSION
• DTV_LNA

In addition, the DTV QoS statistics are also valid.
Properties used on satellite delivery systems

DVB-S delivery system

The following parameters are valid for DVB-S:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
- `DTV_INVERSION`
- `DTV_SYMBOL_RATE`
- `DTV_INNER_FEC`
- `DTV_VOLTAGE`
- `DTV_TONE`

In addition, the `DTV QoS statistics` are also valid.

Future implementations might add those two missing parameters:

- `DTV_DISEQC_MASTER`
- `DTV_DISEQC_SLAVE_REPLY`

DVB-S2 delivery system

In addition to all parameters valid for DVB-S, DVB-S2 supports the following parameters:

- `DTV_MODULATION`
- `DTV_PILOT`
- `DTV_ROLLOFF`
- `DTV_STREAM_ID`

In addition, the `DTV QoS statistics` are also valid.

Turbo code delivery system

In addition to all parameters valid for DVB-S, turbo code supports the following parameters:

- `DTV_MODULATION`

ISDB-S delivery system

The following parameters are valid for ISDB-S:

- `DTV_API_VERSION`
- `DTV_DELIVERY_SYSTEM`
- `DTV_TUNE`
- `DTV_CLEAR`
- `DTV_FREQUENCY`
• \texttt{DTV\_INVERSION}
• \texttt{DTV\_SYMBOL\_RATE}
• \texttt{DTV\_INNER\_FEC}
• \texttt{DTV\_VOLTAGE}
• \texttt{DTV\_STREAM\_ID}

**Frontend Function Calls**

**DVB frontend open()**

**Name**

fe-open - Open a frontend device

**Synopsis**

```c
#include <fcntl.h>

int open(const char *device_name, int flags)
```

**Arguments**

- **device\_name** Device to be opened.
- **flags** Open flags. Access can either be \texttt{O\_RDWR} or \texttt{O\_RDONLY}.

  - Multiple opens are allowed with \texttt{O\_RDONLY}. In this mode, only query and read ioctls are allowed.
  - Only one open is allowed in \texttt{O\_RDWR}. In this mode, all ioctls are allowed.
  - When the \texttt{O\_NONBLOCK} flag is given, the system calls may return \texttt{EAGAIN} error code when no data is available or when the device driver is temporarily busy.
  - Other flags have no effect.

**Description**

This system call opens a named frontend device (\texttt{/dev/dvb/adapter?/frontend?}) for subsequent use. Usually the first thing to do after a successful open is to find out the frontend type with \texttt{ioctl FE\_GET\_INFO}.

The device can be opened in read-only mode, which only allows monitoring of device status and statistics, or read/write mode, which allows any kind of use (e.g. performing tuning operations.)

In a system with multiple front-ends, it is usually the case that multiple devices cannot be open in read/write mode simultaneously. As long as a front-end device is opened in read/write mode, other open() calls in read/write mode will either fail or block, depending on whether non-blocking or blocking mode was specified. A front-end device opened in blocking mode can later be put into non-blocking mode (and vice versa) using the \texttt{F\_SETFL} command of the \texttt{fcntl} system call. This is a standard system call, documented in the Linux manual page for \texttt{fcntl}. When an open() call has succeeded, the device will be ready for use in the specified mode. This implies that the corresponding hardware is powered up, and that other front-ends may have been powered down to make that possible.
Return Value

On success \texttt{open()} returns the new file descriptor. On error, -1 is returned, and the \texttt{errno} variable is set appropriately.

Possible error codes are:

\textbf{EACCES}  The caller has no permission to access the device.

\textbf{EBUSY}  The device driver is already in use.

\textbf{ENXIO}  No device corresponding to this device special file exists.

\textbf{ENOMEM}  Not enough kernel memory was available to complete the request.

\textbf{EMFILE}  The process already has the maximum number of files open.

\textbf{ENFILE}  The limit on the total number of files open on the system has been reached.

\textbf{ENODEV}  The device got removed.

\textbf{DVB frontend close()}

Name

\texttt{fe-close} - Close a frontend device

Synopsis

\begin{verbatim}
#include <unistd.h>

int close(int fd)

\end{verbatim}

Arguments

\texttt{fd}  File descriptor returned by \texttt{open()}.

Description

This system call closes a previously opened front-end device. After closing a front-end device, its corresponding hardware might be powered down automatically.

Return Value

The function returns 0 on success, -1 on failure and the \texttt{errno} is set appropriately. Possible error codes:

\textbf{EBADF}  \texttt{fd} is not a valid open file descriptor.

\textbf{ioctl FE_GET_INFO}

Name

\texttt{FE_GET_INFO} - Query DVB frontend capabilities and returns information about the front-end. This call only requires read-only access to the device
Synopsis

```c
int ioctl(int fd, FE_GET_INFO, struct dvb_frontend_info *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp** pointer to struct `dvb_frontend_info`

Description

All DVB frontend devices support the `FE_GET_INFO` ioctl. It is used to identify kernel devices compatible with this specification and to obtain information about driver and hardware capabilities. The ioctl takes a pointer to `dvb_frontend_info` which is filled by the driver. When the driver is not compatible with this specification the ioctl returns an error.

```plaintext
struct dvb_frontend_info
```

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl FE_READ_STATUS

Name

FE_READ_STATUS - Returns status information about the front-end. This call only requires - read-only access to the device

Synopsis

int ioctl(int fd, FE_READ_STATUS, unsigned int *status)
Arguments

**fd** File descriptor returned by `open()`.

**status** pointer to a bitmask integer filled with the values defined by enum `fe_status`.

Description

All DVB frontend devices support the `FE_READ_STATUS` ioctl. It is used to check about the locking status of the frontend after being tuned. The ioctl takes a pointer to an integer where the status will be written.

**Note:**

The size of status is actually `sizeof(enum fe_status)`, with varies according with the architecture. This needs to be fixed in the future.

`int fe_status`

The `fe_status` parameter is used to indicate the current state and/or state changes of the frontend hardware. It is produced using the enum `fe_status` values on a bitmask

<table>

</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**ioctl FE_SET_PROPERTY, FE_GET_PROPERTY**

Name

`FE_SET_PROPERTY` - `FE_GET_PROPERTY` - `FE_SET_PROPERTY` sets one or more frontend properties. -

`FE_GET_PROPERTY` returns one or more frontend properties.
Synopsis

int ioctl(int fd, FE_GETPROPERTY, struct dtv_properties *argp)
int ioctl(int fd, FE_SETPROPERTY, struct dtv_properties *argp)

Arguments

fd File descriptor returned by open().
argp pointer to struct dtv_properties

Description

All DVB frontend devices support the FE_SET_PROPERTY and FE_GET_PROPERTY ioctls. The supported properties and statistics depends on the delivery system and on the device:

- **FE_SET_PROPERTY:**
  - This ioctl is used to set one or more frontend properties.
  - This is the basic command to request the frontend to tune into some frequency and to start decoding the digital TV signal.
  - This call requires read/write access to the device.
  - At return, the values are updated to reflect the actual parameters used.

- **FE_GET_PROPERTY:**
  - This ioctl is used to get properties and statistics from the frontend.
  - No properties are changed, and statistics aren’t reset.
  - This call only requires read-only access to the device.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**ioctl FE_DISEQC_RESET_OVERLOAD**

Name

FE_DISEQC_RESET_OVERLOAD - Restores the power to the antenna subsystem, if it was powered off due to power overload.

Synopsis

int ioctl(int fd, FE_DISEQC_RESET_OVERLOAD, NULL)

Arguments

fd File descriptor returned by open().
Description

If the bus has been automatically powered off due to power overload, this ioctl call restores the power to
the bus. The call requires read/write access to the device. This call has no effect if the device is manually
powered off. Not all DVB adapters support this ioctl.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes
are described at the `Generic Error Codes` chapter.

ioctl FE_DISEQC_SEND_MASTER_CMD

Name

FE_DISEQC_SEND_MASTER_CMD - Sends a DiSEqC command

Synopsis

```c
int ioctl(int fd, FE_DISEQC_SEND_MASTER_CMD, struct dvb_diseqc_master_cmd *argp)
```

Arguments

`fd` File descriptor returned by `open()`.
`argp` pointer to struct `dvb_diseqc_master_cmd`

Description

Sends a DiSEqC command to the antenna subsystem.

struct dvb_diseqc_master_cmd

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

<td>DiSEqC message (framing, address, command, data[3])</td>
</tr>
<tr>
<td><code>uint8_t</code></td>
<td>msg_len</td>
<td>Length of the DiSEqC message. Valid values are 3 to 6</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes
are described at the `Generic Error Codes` chapter.
ioctl FE_DISEQC_RECV_SLAVE_REPLY

Name

FE_DISEQC_RECV_SLAVE_REPLY - Receives reply from a DiSEqC 2.0 command

Synopsis

```c
int ioctl(int fd, FE_DISEQC_RECV_SLAVE_REPLY, struct dvb_diseqc_slave_reply *argp)
```

Arguments

- **fd**: File descriptor returned by `open()`.
- **argp**: Pointer to struct `dvb_diseqc_slave_reply`

Description

Receives reply from a DiSEqC 2.0 command.

```c
table 1.181: struct dvb_diseqc_slave_reply

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>msg_len</td>
<td>Length of the DiSEqC message. Valid values are 0 to 4, where 0 means no msg</td>
</tr>
<tr>
<td>int</td>
<td>timeout</td>
<td>Return from ioctl after timeout ms with errorcode when no message was received</td>
</tr>
</tbody>
</table>
```

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the **Generic Error Codes** chapter.

ioctl FE_DISEQC_SEND_BURST

Name

FE_DISEQC_SEND_BURST - Sends a 22KHz tone burst for 2x1 mini DiSEqC satellite selection.

Synopsis

```c
int ioctl(int fd, FE_DISEQC_SEND_BURST, enum fe_sec_mini_cmd *tone)
```

Arguments

- **fd**: File descriptor returned by `open()`.
- **tone**: Pointer to enum `fe_sec_mini_cmd`
**Description**

This ioctl is used to set the generation of a 22kHz tone burst for mini DiSEqC satellite selection for 2x1 switches. This call requires read/write permissions.

It provides support for what’s specified at Digital Satellite Equipment Control (DiSEqC) - Simple “ToneBurst” Detection Circuit specification.

### enum fe_sec_mini_cmd

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEC_MINI_A</td>
<td>Sends a mini-DiSEqC 22kHz ‘0’ Tone Burst to select satellite-A</td>
</tr>
<tr>
<td>SEC_MINI_B</td>
<td>Sends a mini-DiSEqC 22kHz ‘1’ Data Burst to select satellite-B</td>
</tr>
</tbody>
</table>

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**ioctl FE_SET_TONE**

**Name**

FE_SET_TONE - Sets/resets the generation of the continuous 22kHz tone.

**Synopsis**

```c
int ioctl(int fd, FE_SET_TONE, enum fe_sec_tone_mode *tone)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `tone` pointer to enum `fe_sec_tone_mode`

**Description**

This ioctl is used to set the generation of the continuous 22kHz tone. This call requires read/write permissions.

Usually, satellite antenna subsystems require that the digital TV device to send a 22kHz tone in order to select between high/low band on some dual-band LNBF. It is also used to send signals to DiSEqC equipment, but this is done using the DiSEqC ioctls.
Attention:

If more than one device is connected to the same antenna, setting a tone may interfere on other devices, as they may lose the capability of selecting the band. So, it is recommended that applications would change to SEC_TONE_OFF when the device is not used.

enum fe_sec_tone_mode

Table 1.183: enum fe_sec_tone_mode

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEC_TONE_ON</td>
<td>Sends a 22kHz tone burst to the antenna</td>
</tr>
<tr>
<td>SEC_TONE_OFF</td>
<td>Don’t send a 22kHz tone to the antenna (except if the FE_DISEQC_* ioctls are called)</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl FE_SET_VOLTAGE

Name

FE_SET_VOLTAGE - Allow setting the DC level sent to the antenna subsystem.

Synopsis

int ioctl(int fd, FE_SET_VOLTAGE, enum fe_sec_voltage *voltage)

Arguments

fd File descriptor returned by open() .

voltage pointer to enum fe_sec_voltage

Valid values are described at enum fe_sec_voltage .

Description

This ioctl allows to set the DC voltage level sent through the antenna cable to 13V, 18V or off.

Usually, a satellite antenna subsystems require that the digital TV device to send a DC voltage to feed power to the LNBf. Depending on the LNBf type, the polarization or the intermediate frequency (IF) of the LNBf can controlled by the voltage level. Other devices (for example, the ones that implement DISEqC and multipoint LNBf’s don’t need to control the voltage level, provided that either 13V or 18V is sent to power up the LNBf.
Attention:

if more than one device is connected to the same antenna, setting a voltage level may interfere on other devices, as they may lose the capability of setting polarization or IF. So, on those cases, setting the voltage to SEC_VOLTAGE_OFF while the device is not is used is recommended.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl FE_ENABLE_HIGH_LNB_VOLTAGE

Name

FE_ENABLE_HIGH_LNB_VOLTAGE - Select output DC level between normal LNBf voltages or higher LNBf - voltages.

Synopsis

int ioctl(int fd, FE_ENABLE_HIGH_LNB_VOLTAGE, unsigned int high)

Arguments

fd File descriptor returned by open() .

high Valid flags:
- 0 - normal 13V and 18V.
- >0 - enables slightly higher voltages instead of 13/18V, in order to compensate for long antenna cables.

Description

Select output DC level between normal LNBf voltages or higher LNBf voltages between 0 (normal) or a value greater than 0 for higher voltages.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl FE_SET_FRONTEND_TUNE_MODE

Name

FE_SET_FRONTEND_TUNE_MODE - Allow setting tuner mode flags to the frontend.
Synopsis

```c
int ioctl(int fd, FE_SET_FRONTEND_TUNE_MODE, unsigned int flags)
```

Arguments

`fd` File descriptor returned by `open()`.

`flags` Valid flags:
- 0 - normal tune mode
- FE_TUNE_MODE_ONESHOT - When set, this flag will disable any zigzagging or other “normal” tuning behaviour. Additionally, there will be no automatic monitoring of the lock status, and hence no frontend events will be generated. If a frontend device is closed, this flag will be automatically turned off when the device is reopened read-write.

Description

Allow setting tuner mode flags to the frontend, between 0 (normal) or FE_TUNE_MODE_ONESHOT mode

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

DVB Frontend legacy API (a. k. a. DVBv3)

The usage of this API is deprecated, as it doesn’t support all digital TV standards, doesn’t provide good statistics measurements and provides incomplete information. This is kept only to support legacy applications.

Frontend Legacy Data Types

Frontend type

For historical reasons, frontend types are named by the type of modulation used in transmission. The frontend types are given by `fe_type_t` type, defined as:
### Table 1.184: Frontend types

<table>
<thead>
<tr>
<th>fe_type</th>
<th>Description</th>
<th>DTV_DELIVERY_SYSTEM equivalent type</th>
</tr>
</thead>
<tbody>
<tr>
<td>FE_QPSK</td>
<td>For DVB-S standard</td>
<td>SYS_DVBS</td>
</tr>
<tr>
<td>FE_QAM</td>
<td>For DVB-C annex A standard</td>
<td>SYS_DVBC_ANNEX_A</td>
</tr>
<tr>
<td>FE_OFDM</td>
<td>For DVB-T standard</td>
<td>SYS_DVBT</td>
</tr>
<tr>
<td>FE_ATSC</td>
<td>For ATSC standard (terrestrial) or for DVB-C Annex B (cable) used in US.</td>
<td>SYS_ATSC (terrestrial) or SYS_DVBC_ANNEX_B (cable)</td>
</tr>
</tbody>
</table>

Newer formats like DVB-S2, ISDB-T, ISDB-S and DVB-T2 are not described at the above, as they’re supported via the new `FE_GET_PROPERTY/FE_GET_SET_PROPERTY` ioctl’s, using the `DTV_DELIVERY_SYSTEM` parameter.

In the old days, struct `dvb_frontend_info` used to contain `fe_type_t` field to indicate the delivery systems, filled with either FE_QPSK, FE_QAM, FE_OFDM or FE_ATSC. While this is still filled to keep backward compatibility, the usage of this field is deprecated, as it can report just one delivery system, but some devices support multiple delivery systems. Please use `DTV_ENUM_DELSYS` instead.

On devices that support multiple delivery systems, struct `dvb_frontend_info` :: `fe_type_t` is filled with the currently standard, as selected by the last call to `FE_SET_PROPERTY` using the `DTV_DELIVERY_SYSTEM` property.

### Frontend bandwidth

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANDWIDTH_AUTO</td>
<td>Autodetect bandwidth (if supported)</td>
</tr>
<tr>
<td>BANDWIDTH_1_712_MHZ</td>
<td>1.712 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_5_MHZ</td>
<td>5 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_6_MHZ</td>
<td>6 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_7_MHZ</td>
<td>7 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_8_MHZ</td>
<td>8 MHz</td>
</tr>
<tr>
<td>BANDWIDTH_10_MHZ</td>
<td>10 MHz</td>
</tr>
</tbody>
</table>

### Frontend parameters

The kind of parameters passed to the frontend device for tuning depend on the kind of hardware you are using.

The struct `dvb_frontend_parameters` uses an union with specific per-system parameters. However, as newer delivery systems required more data, the structure size weren’t enough to fit, and just extending its size would break the existing applications. So, those parameters were replaced by the usage of

---

1.3. Part II - Digital TV API

403
**FE_GET_PROPERTY/FE_SET_PROPERTY** ioctl’s. The new API is flexible enough to add new parameters to existing delivery systems, and to add newer delivery systems.

So, newer applications should use **FE_GET_PROPERTY/FE_SET_PROPERTY** instead, in order to be able to support the newer System Delivery like DVB-S2, DVB-T2, DVB-C2, ISDB, etc.

All kinds of parameters are combined as an union in the `FrontendParameters` structure:

```c
struct dvb_frontend_parameters {
    uint32_t frequency; /* (absolute) frequency in Hz for QAM/OFDM */
    fe_spectral_inversion_t inversion; /* intermediate frequency in kHz for QPSK */
    union {
        struct dvb_qpsk_parameters qpsk;
        struct dvb_qam_parameters qam;
        struct dvb_ofdm_parameters ofdm;
        struct dvb_vsb_parameters vsb;
    } u;
};
```

In the case of QPSK frontends the `frequency` field specifies the intermediate frequency, i.e. the offset which is effectively added to the local oscillator frequency (LOF) of the LNB. The intermediate frequency has to be specified in units of kHz. For QAM and OFDM frontends the frequency specifies the absolute frequency and is given in Hz.

### QPSK parameters

For satellite QPSK frontends you have to use the `dvb_qpsk_parameters` structure:

```c
struct dvb_qpsk_parameters {
    uint32_t symbol_rate; /* symbol rate in Symbols per second */
    fe_code_rate_t fec_inner; /* forward error correction (see above) */
};
```

### QAM parameters

For cable QAM frontend you use the `dvb_qam_parameters` structure:

```c
struct dvb_qam_parameters {
    uint32_t symbol_rate; /* symbol rate in Symbols per second */
    fe_code_rate_t fec_inner; /* forward error correction (see above) */
    fe_modulation_t modulation; /* modulation type (see above) */
};
```

### VSB parameters

ATSC frontends are supported by the `dvb_vsb_parameters` structure:

```c
struct dvb_vsb_parameters {
    fe_modulation_t modulation; /* modulation type (see above) */
};
```

### OFDM parameters

DVB-T frontends are supported by the `dvb_ofdm_parameters` structure:
```
struct dvb_ofdm_parameters {
    fe_bandwidth_t bandwidth;
    fe_code_rate_t code_rate_HP; /* high priority stream code rate */
    fe_code_rate_t code_rate_LP; /* low priority stream code rate */
    fe_modulation_t constellation; /* modulation type (see above) */
    fe_transmit_mode_t transmission_mode;
    fe_guard_interval_t guard_interval;
    fe_hierarchy_t hierarchy_information;
};
```

**frontend events**

```
struct dvb_frontend_event {
    fe_status_t status;
    struct dvb_frontend_parameters parameters;
};
```

**Frontend Legacy Function Calls**

Those functions are defined at DVB version 3. The support is kept in the kernel due to compatibility issues only. Their usage is strongly not recommended

**FE_READ_BER**

**Name**

FE_READ_BER

**Attention:**

*This ioctl is deprecated.*

**Synopsis**

```
int ioctl(int fd, FE_READ_BER, uint32_t *ber)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **ber** The bit error rate is stored into *ber.

**Description**

This ioctl call returns the bit error rate for the signal currently received/demodulated by the front-end. For this command, read-only access to the device is sufficient.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**FE_READ_SNR**

Name

FE_READ_SNR

**Attention:**

This ioctl is deprecated.

Synopsis

```c
int ioctl(int fd, FE_READ_SNR, int16_t *snr)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **snr** The signal-to-noise ratio is stored into *snr.

Description

This ioctl call returns the signal-to-noise ratio for the signal currently received by the front-end. For this command, read-only access to the device is sufficient.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**FE_READ_SIGNAL_STRENGTH**

Name

FE_READ_SIGNAL_STRENGTH

**Attention:**

This ioctl is deprecated.
Synopsis

```c
int ioctl(int fd, FE_READ_SIGNAL_STRENGTH, uint16_t *strength)
```

Arguments

*fd* File descriptor returned by `open()`.

*strength* The signal strength value is stored into *strength*.

Description

This ioctl call returns the signal strength value for the signal currently received by the front-end. For this command, read-only access to the device is sufficient.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**FE_READ_UNCORRECTED_BLOCKS**

Name

FE_READ_UNCORRECTED_BLOCKS

**Attention:**

This ioctl is deprecated.

Synopsis

```c
int ioctl(int fd, FE_READ_UNCORRECTED_BLOCKS, uint32_t *ublocks)
```

Arguments

*fd* File descriptor returned by `open()`.

*ublocks* The total number of uncorrected blocks seen by the driver so far.

Description

This ioctl call returns the number of uncorrected blocks detected by the device driver during its lifetime. For meaningful measurements, the increment in block count during a specific time interval should be calculated. For this command, read-only access to the device is sufficient.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

FE_SET_FRONTEND

Attention:
This ioctl is deprecated.

Name

FE_SET_FRONTEND

Synopsis

int ioctl(int fd, FE_SET_FRONTEND, struct dvb_frontend_parameters *p)

Arguments

fd File descriptor returned by open().

p Points to parameters for tuning operation.

Description

This ioctl call starts a tuning operation using specified parameters. The result of this call will be successful if the parameters were valid and the tuning could be initiated. The result of the tuning operation in itself, however, will arrive asynchronously as an event (see documentation for FE_GET_EVENT and FrontendEvent.) If a new FE_SET_FRONTEND operation is initiated before the previous one was completed, the previous operation will be aborted in favor of the new one. This command requires read/write access to the device.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL Maximum supported symbol rate reached.

FE_GET_FRONTEND

Name

FE_GET_FRONTEND

408 Chapter 1. Linux Media Infrastructure userspace API
**Attention:**

This `ioctl` is deprecated.

**Synopsis**

```c
int ioctl(int fd, FE_GET_FRONTEND, struct dvb_frontend_parameters *p)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `p` Points to parameters for tuning operation.

**Description**

This `ioctl` call queries the currently effective frontend parameters. For this command, read-only access to the device is sufficient.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

- `EINVAL` Maximum supported symbol rate reached.

**FE_GET_EVENT**

**Name**

FE_GET_EVENT

**Synopsis**

```c
int ioctl(int fd, FE_GET_EVENT, struct dvb_frontend_event *ev)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `ev` Points to the location where the event, if any, is to be stored.
Description

This ioctl call returns a frontend event if available. If an event is not available, the behavior depends on whether the device is in blocking or non-blocking mode. In the latter case, the call fails immediately with errno set to EWOULDBLOCK. In the former case, the call blocks until an event becomes available.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

<table>
<thead>
<tr>
<th>EWOULDBLOCK</th>
<th>There is no event pending, and the device is in non-blocking mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>EOVERFLOW</td>
<td>Overflow in event queue - one or more events were lost.</td>
</tr>
</tbody>
</table>

FE_DISHNETWORK_SEND_LEGACY_CMD

Name

FE_DISHNETWORK_SEND_LEGACY_CMD

Synopsis

int ioctl(int fd, FE_DISHNETWORK_SEND_LEGACY_CMD, unsigned long cmd)

Arguments

fd File descriptor returned by open().

cmd Sends the specified raw cmd to the dish via DISEqC.

Description

Warning:

This is a very obscure legacy command, used only at stv0299 driver. Should not be used on newer drivers.

It provides a non-standard method for selecting Diseqc voltage on the frontend, for Dish Network legacy switches.

As support for this ioctl were added in 2004, this means that such dishes were already legacy in 2004.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.
1.3.3 DVB Demux Device

The DVB demux device controls the filters of the DVB hardware/software. It can be accessed through /dev/adapter?/demux?. Data types and and ioctl definitions can be accessed by including linux/dvb/dmx.h in your application.

Demux Data Types

Output for the demux

Demux Function Calls

DVB demux open()

Name

DVB demux open()

Synopsis

```
int open(const char *deviceName, int flags)
```

Arguments

name Name of specific DVB demux device.
flags A bit-wise OR of the following flags:

<table>
<thead>
<tr>
<th>flags</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>O_RDONLY</td>
<td>read-only access</td>
</tr>
<tr>
<td>O_RDWR</td>
<td>read/write access</td>
</tr>
<tr>
<td>O_NONBLOCK</td>
<td>open in non-blocking mode (blocking mode is the default)</td>
</tr>
</tbody>
</table>

Description

This system call, used with a device name of /dev/dvb/adapter0/demux0, allocates a new filter and returns a handle which can be used for subsequent control of that filter. This call has to be made for each filter to be used, i.e. every returned file descriptor is a reference to a single filter. /dev/dvb/adapter0/dvr0 is a logical device to be used for retrieving Transport Streams for digital video recording. When reading from this device a transport stream containing the packets from all PES filters set in the corresponding demux device (/dev/dvb/adapter0/demux0) having the output set to DMX_OUT_TS_TAP. A recorded Transport Stream is replayed by writing to this device.

The significance of blocking or non-blocking mode is described in the documentation for functions where there is a difference. It does not affect the semantics of the open() call itself. A device opened in blocking mode can later be put into non-blocking mode (and vice versa) using the F_SETFL command of the fcntl system call.

Return Value

<table>
<thead>
<tr>

DVB demux close()

Name

DVB demux close()

Synopsis

int close(int fd)

Arguments

fd File descriptor returned by a previous call to open().

Description

This system call deactivates and deallocates a filter that was previously allocated via the open() call.

Return Value

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EBADF</td>
<td>fd is not a valid open file descriptor.</td>
</tr>
</tbody>
</table>

DVB demux read()
Synopsis

```
size_t read(int fd, void *buf, size_t count)
```

Arguments

- **fd**
  File descriptor returned by a previous call to `open()`.
- **buf** Buffer to be filled
- **count** Max number of bytes to read

Description

This system call returns filtered data, which might be section or PES data. The filtered data is transferred from the driver’s internal circular buffer to buf. The maximum amount of data to be transferred is implied by count.

Return Value

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EWOULDBLOCK</td>

</tr>
<tr>
<td>EFAULT</td>
<td>The driver failed to write to the callers buffer due to an invalid *buf pointer.</td>
</tr>
</tbody>
</table>

DVB demux write()

Name

DVB demux write()

Synopsis

```
ssize_t write(int fd, const void *buf, size_t count)
```

Arguments

- **fd** File descriptor returned by a previous call to `open()`.
- **buf** Buffer with data to be written
- **count** Number of bytes at the buffer
Description

This system call is only provided by the logical device /dev/dvb/adapter0/dvr0, associated with the physical demux device that provides the actual DVR functionality. It is used for replay of a digitally recorded Transport Stream. Matching filters have to be defined in the corresponding physical demux device, /dev/dvb/adapter0/demux0. The amount of data to be transferred is implied by count.

Return Value

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EWOULDBLOCK</td>
<td>No data was written. This might happen if O_NONBLOCK was specified and there is no more buffer space available (if O_NONBLOCK is not specified the function will block until buffer space is available).</td>
</tr>
<tr>
<td>EBUSY</td>
<td>This error code indicates that there are conflicting requests. The corresponding demux device is setup to receive data from the front-end. Make sure that these filters are stopped and that the filters with input set to DMX_IN_DVR are started.</td>
</tr>
<tr>
<td>EBADF</td>
<td>fd is not a valid open file descriptor.</td>
</tr>
</tbody>
</table>

DMX_START

Name

DMX_START

Synopsis

int ioctl(int fd, DMX_START)

Arguments

fd File descriptor returned by open().

Description

This ioctl call is used to start the actual filtering operation defined via the ioctl calls DMX_SET_FILTER or DMX_SET_PES_FILTER.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EINVAL</td>
<td>Invalid argument, i.e. no filtering parameters provided via the DMX_SET_FILTER or DMX_SET_PES_FILTER functions.</td>
</tr>
<tr>
<td>EBUSY</td>
<td>This error code indicates that there are conflicting requests. There are active filters filtering data from another input source. Make sure that these filters are stopped before starting this filter.</td>
</tr>
</tbody>
</table>
**DMX_STOP**

**Name**

DMX_STOP

**Synopsis**

```
int ioctl(int fd, DMX_STOP)
```

**Arguments**

- **fd** File descriptor returned by `open()`.

**Description**

This ioctl call is used to stop the actual filtering operation defined via the ioctl calls DMX_SET_FILTER or DMX_SET_PES_FILTER and started via the DMX_START command.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

**DMX_SET_FILTER**

**Name**

DMX_SET_FILTER

**Synopsis**

```
int ioctl(int fd, DMX_SET_FILTER, struct dmx_sct_filter_params *params)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **params**
  - Pointer to structure containing filter parameters.

**Description**

This ioctl call sets up a filter according to the filter and mask parameters provided. A timeout may be defined stating number of seconds to wait for a section to be loaded. A value of 0 means that no timeout should be applied. Finally there is a flag field where it is possible to state whether a section should be CRC-checked, whether the filter should be a “one-shot” filter, i.e. if the filtering operation should be stopped after the first section is received, and whether the filtering operation should be started immediately (without waiting for a DMX_START ioctl call). If a filter was previously set-up, this filter will be canceled, and the receive buffer will be flushed.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**DMX_SET_PES_FILTER**

**Name**

DMX_SET_PES_FILTER

**Synopsis**

```c
int ioctl(int fd, DMX_SET_PES_FILTER, struct dmx_pes_filter_params *params)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **params** Pointer to structure containing filter parameters.

**Description**

This ioctl call sets up a PES filter according to the parameters provided. By a PES filter is meant a filter that is based just on the packet identifier (PID), i.e. no PES header or payload filtering capability is supported.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EBUSY</td>
<td>This error code indicates that there are conflicting requests. There are active filters filtering data from another input source. Make sure that these filters are stopped before starting this filter.</td>
</tr>
</tbody>
</table>

**DMX_SET_BUFFER_SIZE**

**Name**

DMX_SET_BUFFER_SIZE

**Synopsis**

```c
int ioctl(int fd, DMX_SET_BUFFER_SIZE, unsigned long size)
```

**Arguments**

- **fd** File descriptor returned by `open()`.
- **size** Unsigned long size
Description

This ioctl call is used to set the size of the circular buffer used for filtered data. The default size is two maximum sized sections, i.e. if this function is not called a buffer size of 2 * 4096 bytes will be used.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

DMX_GET_EVENT

Name

DMX_GET_EVENT

Synopsis

int ioctl(int fd, DMX_GET_EVENT, struct dmx_event *ev)

Arguments

fd File descriptor returned by open().
ev Pointer to the location where the event is to be stored.

Description

This ioctl call returns an event if available. If an event is not available, the behavior depends on whether the device is in blocking or non-blocking mode. In the latter case, the call fails immediately with errno set to EWOULDBLOCK. In the former case, the call blocks until an event becomes available.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EWOULDBLOCK There is no event pending, and the device is in non-blocking mode.

DMX_GET_STC

Name

DMX_GET_STC

Synopsis

int ioctl(int fd, DMX_GET_STC, struct dmx_stc *stc)
Arguments

fd  File descriptor returned by `open()`.
stc  Pointer to the location where the stc is to be stored.

Description

This ioctl call returns the current value of the system time counter (which is driven by a PES filter of type DMX_PES_PCR). Some hardware supports more than one STC, so you must specify which one by setting the num field of stc before the ioctl (range 0...n). The result is returned in form of a ratio with a 64 bit numerator and a 32 bit denominator, so the real 90kHz STC value is stc->stc / stc->base.

ReturnValue

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

`EINVAL`  Invalid stc number.

DMX_GET_PES_PIDS

Name

DMX_GET_PES_PIDS

Synopsis

```c
int ioctl(fd, DMX_GET_PES_PIDS, __u16 pids[5])
```

Arguments

fd  File descriptor returned by `open()`.
pids  Undocumented.

Description

**Note:**

This ioctl is undocumented. Documentation is welcome.

ReturnValue

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.
DMX_GET_CAPS

Name
DMX_GET_CAPS

Synopsis

int ioctl(fd, DMX_GET_CAPS, dmx_caps_t *caps)

Arguments

fd  File descriptor returned by open().
caps  Undocumented.

Description

**Note:**
This ioctl is undocumented. Documentation is welcome.

Return Value
On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

DMX_SET_SOURCE

Name
DMX_SET_SOURCE

Synopsis

int ioctl(fd, DMX_SET_SOURCE, dmx_source_t *src)

Arguments

fd  File descriptor returned by open().
src  Undocumented.
Description

Note:

This ioctl is undocumented. Documentation is welcome.

ReturnValue

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

DMX_ADD_PID

Name

DMX_ADD_PID

Synopsis

int ioctl(fd, DMX_ADD_PID, __u16 *pid)

Arguments

fd File descriptor returned by open().

pid PID number to be filtered.

Description

This ioctl call allows to add multiple PIDs to a transport stream filter previously set up with DMX_SET_PES_FILTER and output equal to DMX_OUT_TSDEMUX_TAP.

ReturnValue

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

DMX_REMOVE_PID

Name

DMX_REMOVE_PID

Synopsis

int ioctl(fd, DMX_REMOVE_PID, __u16 *pid)
Arguments

**fd**  File descriptor returned by `open()`.

**pid**  PID of the PES filter to be removed.

Description

This ioctl call allows to remove a PID when multiple PIDs are set on a transport stream filter, e. g. a filter previously set up with output equal to DMX_OUT_TSDEMUX_TAP, created via either DMX_SET_PES_FILTER or DMX_ADD_PID.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

1.3.4 DVB CA Device

The DVB CA device controls the conditional access hardware. It can be accessed through `/dev/dvb/adapter?/ca?`. Data types and and ioctl definitions can be accessed by including `linux/dvb/ca.h` in your application.

CA Data Types

caslotinfo_t

typedef struct ca_slot_info {
    int num;   /* slot number */
    int type;  /* CA interface this slot supports */
#define CA_CI 1  /* CI high level interface */
#define CA_CI_LINK 2  /* CI link layer level interface */
#define CA_CI_PHYS 4  /* CI physical layer level interface */
#define CA_DESCR 8  /* built-in descrambler */
#define CA_SC 128  /* simple smart card interface */

    unsigned int flags;
#define CA_CI_MODULE_PRESENT 1  /* module (or card) inserted */
#define CA_CI_MODULE_READY 2
} ca_slot_info_t;

cadescrinfo_t

typedef struct ca_descr_info {
    unsigned int num;  /* number of available descramblers (keys) */
    unsigned int type;  /* type of supported scrambling system */
#define CA_ECD 1
#define CA_NDS 2
#define CA_DSS 4
} ca_descr_info_t;

1.3. Part II - Digital TV API
ca_caps_t

typedef struct ca_caps {
   unsigned int slot_num; /* total number of CA card and module slots */
   unsigned int slot_type; /* OR of all supported types */
   unsigned int descr_num; /* total number of descrambler slots (keys) */
   unsigned int descr_type; /* OR of all supported types */
} ca_cap_t;

c_msg_t

 /**< a message to/from a CI-CAM */
 typedef struct ca_msg {
    unsigned int index;
    unsigned int type;
    unsigned int length;
    unsigned char msg[256];
 } ca_msg_t;

c_descr_t

 typedef struct ca_descr {
    unsigned int index;
    unsigned int parity;
    unsigned char cw[8];
 } ca_descr_t;

c-uid

 typedef struct ca_pid {
    unsigned int pid;
    int index; /* -1 == disable*/
 } ca_pid_t;

CA Function Calls
DVB CA open()

Name
DVB CA open()

Synopsis

int open(const char *name, int flags)

Arguments

name Name of specific DVB CA device.
flags A bit-wise OR of the following flags:
### Description

This system call opens a named ca device (e.g. /dev/ost/ca) for subsequent use.

When an open() call has succeeded, the device will be ready for use. The significance of blocking or non-blocking mode is described in the documentation for functions where there is a difference. It does not affect the semantics of the open() call itself. A device opened in blocking mode can later be put into non-blocking mode (and vice versa) using the F_SETFL command of the fcntl system call. This is a standard system call, documented in the Linux manual page for fcntl. Only one user can open the CA Device in O_RDWR mode. All other attempts to open the device in this mode will fail, and an error code will be returned.

### Return Value

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENODEV</td>
<td>Device driver not loaded/available.</td>
</tr>
<tr>
<td>EINTERNAL</td>
<td>Internal error.</td>
</tr>
<tr>
<td>EBUSY</td>
<td>Device or resource busy.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>Invalid argument.</td>
</tr>
</tbody>
</table>

### DVB CA close()

#### Name

DVB CA close()

#### Synopsis

```c
int close(int fd)
```

#### Arguments

- `fd` File descriptor returned by a previous call to `open()`.

#### Description

This system call closes a previously opened CA device.

#### Return Value

- `EBADF` fd is not a valid open file descriptor.

### CA_RESET

#### Name

CA_RESET
Synopsis

int ioctl(fd, CA_RESET)

Arguments

fd File descriptor returned by a previous call to open().

description

Note:

This ioctl is undocumented. Documentation is welcome.

ReturnValue

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

CA_GET_CAP

Name

CA_GET_CAP

Synopsis

int ioctl(fd, CA_GET_CAP, ca_caps_t *caps)

Arguments

fd File descriptor returned by a previous call to open().
caps Undocumented.

description

Note:

This ioctl is undocumented. Documentation is welcome.

ReturnValue

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.
CA_GET_SLOT_INFO

Name

CA_GET_SLOT_INFO

Synopsis

```c
int ioctl(fd, CA_GET_SLOT_INFO, ca_slot_info_t *info)
```

Arguments

- `fd` File descriptor returned by a previous call to `open()`.
- `info` Undocumented.

Description

**Note:**

This ioctl is undocumented. Documentation is welcome.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

CA_GET_DESCR_INFO

Name

CA_GET_DESCR_INFO

Synopsis

```c
int ioctl(fd, CA_GET_DESCR_INFO, ca_descr_info_t *desc)
```

Arguments

- `fd` File descriptor returned by a previous call to `open()`.
- `desc` Undocumented.
Description

**Note:**

This ioctl is undocumented. Documentation is welcome.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

CA_GET_MSG

Name

CA_GET_MSG

Synopsis

```c
int ioctl(fd, CA_GET_MSG, ca_msg_t *msg)
```

Arguments

- `fd` File descriptor returned by a previous call to `open()`.
- `msg` Undocumented.

Description

**Note:**

This ioctl is undocumented. Documentation is welcome.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

CA_SEND_MSG

Name

CA_SEND_MSG
### CA_SEND_MSG

**Synopsis**

```c
int ioctl(fd, CA_SEND_MSG, ca_msg_t *msg)
```

**Arguments**

- **fd** File descriptor returned by a previous call to `open()`.
- **msg** Undocumented.

**Description**

**Note:**

This ioctl is undocumented. Documentation is welcome.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

### CA_SET_DESCR

**Name**

CA_SET_DESCR

**Synopsis**

```c
int ioctl(fd, CA_SET_DESCR, cadescr_t *desc)
```

**Arguments**

- **fd** File descriptor returned by a previous call to `open()`.
- **msg** Undocumented.

**Description**

**Note:**

This ioctl is undocumented. Documentation is welcome.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**CA_SET_PID**

Name

CA_SET_PID

Synopsis

```c
int ioctl(fd, CA_SET_PID, ca_pid_t *pid)
```

Arguments

- `fd` File descriptor returned by a previous call to `open()`.
- `pid` Undocumented.

Description

**Note:**

This ioctl is undocumented. Documentation is welcome.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

1.3.5 DVB Network API

The DVB net device controls the mapping of data packages that are part of a transport stream to be mapped into a virtual network interface, visible through the standard Linux network protocol stack.

Currently, two encapsulations are supported:

- Multi Protocol Encapsulation (MPE)
- Ultra Lightweight Encapsulation (ULE)

In order to create the Linux virtual network interfaces, an application needs to tell to the Kernel what are the PIDs and the encapsulation types that are present on the transport stream. This is done through `/dev/dvb/adapter?/net?` device node. The data will be available via virtual dvb?_? network interfaces, and will be controlled/routed via the standard ip tools (like ip, route, netstat, ifconfig, etc).

Data types and and ioctl definitions are defined via `linux/dvb/net.h` header.
1.3.6 DVB net Function Calls

ioctl NET_ADD_IF

Name

NET_ADD_IF - Creates a new network interface for a given Packet ID.

Synopsis

int ioctl(int fd, NET_ADD_IF, struct dvb_net_if *net_if)

Arguments

fd  File descriptor returned by open().
net_if  pointer to struct dvb_net_if

Description

The NET_ADD_IF ioctl system call selects the Packet ID (PID) that contains a TCP/IP traffic, the type of encapsulation to be used (MPE or ULE) and the interface number for the new interface to be created. When the system call successfully returns, a new virtual network interface is created. The struct dvb_net_if::ifnum field will be filled with the number of the created interface.

struct dvb_net_if description

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pid</td>
<td>Packet ID (PID) of the MPEG-TS that contains data</td>
</tr>
<tr>
<td>ifnum</td>
<td>number of the DVB interface.</td>
</tr>
<tr>
<td>feed-type</td>
<td>Encapsulation type of the feed. It can be: DVB_NET_FEEDTYPE_MPE for MPE encoding or DVB_NET_FEEDTYPE_ULE for ULE encoding.</td>
</tr>
</tbody>
</table>

ReturnValue

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl NET_REMOVE_IF

Name

NET_REMOVE_IF - Removes a network interface.

Synopsis

int ioctl(int fd, NET_REMOVE_IF, int ifnum)
Arguments

**fd** File descriptor returned by `open()`.

**net_if** number of the interface to be removed

Description

The NET_REMOVE_IF ioctl deletes an interface previously created via `NET_ADD_IF`.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**ioctl NET_GET_IF**

Name

NET_GET_IF - Read the configuration data of an interface created via `NET_ADD_IF`.

Synopsis

```c
int ioctl(int fd, NET_GET_IF, struct dvb_net_if *net_if)
```

Arguments

**fd** File descriptor returned by `open()`.

**net_if** pointer to struct `dvb_net_if`

Description

The NET_GET_IF ioctl uses the interface number given by the struct `dvb_net_if` ::ifnum field and fills the content of struct `dvb_net_if` with the packet ID and encapsulation type used on such interface. If the interface was not created yet with `NET_ADD_IF`, it will return -1 and fill the `errno` with EINVAL error code.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

1.3.7 DVB Deprecated APIs

The APIs described here are kept only for historical reasons. There’s just one driver for a very legacy hardware that uses this API. No modern drivers should use it. Instead, audio and video should be using the V4L2 and ALSA APIs, and the pipelines should be set using the Media Controller API.
DVB Video Device

The DVB video device controls the MPEG2 video decoder of the DVB hardware. It can be accessed through `/dev/dvb/adapter0/video0`. Data types and and ioctl definitions can be accessed by including `linux/dvb/video.h` in your application.

Note that the DVB video device only controls decoding of the MPEG video stream, not its presentation on the TV or computer screen. On PCs this is typically handled by an associated video4linux device, e.g. `/dev/video`, which allows scaling and defining output windows.

Some DVB cards don’t have their own MPEG decoder, which results in the omission of the audio and video device as well as the video4linux device.

The ioctls that deal with SPUs (sub picture units) and navigation packets are only supported on some MPEG decoders made for DVD playback.

These ioctls were also used by V4L2 to control MPEG decoders implemented in V4L2. The use of these ioctls for that purpose has been made obsolete and proper V4L2 ioctls or controls have been created to replace that functionality.

Video Data Types

**video_format_t**

The `video_format_t` data type defined by

```c
typedef enum {
    VIDEO_FORMAT_4_3, /* Select 4:3 format */
    VIDEO_FORMAT_16_9, /* Select 16:9 format. */
    VIDEO_FORMAT_221_1 /* 2.21:1 */
} video_format_t;
```

is used in the `VIDEO_SET_FORMAT` function to tell the driver which aspect ratio the output hardware (e.g. TV) has. It is also used in the data structures `video_status` returned by `VIDEO_GET_STATUS` and `video_event` returned by `VIDEO_GET_EVENT` which report about the display format of the current video stream.

**video_displayformat_t**

In case the display format of the video stream and of the display hardware differ the application has to specify how to handle the cropping of the picture. This can be done using the `VIDEO_SET_DISPLAY_FORMAT` call which accepts

```c
typedef enum {
    VIDEO_PAN.Scan, /* use pan and scan format */
    VIDEO_LETTER_BOX, /* use letterbox format */
    VIDEO.CENTER_CUT_OUT /* use center cut out format */
} video_displayformat_t;
```

**video_stream_source_t**

The video stream source is set through the `VIDEO_SELECT_SOURCE` call and can take the following values, depending on whether we are replaying from an internal (demuxer) or external (user write) source.
typedef enum {
    VIDEO_SOURCE_DEMUX, /* Select the demux as the main source */
    VIDEO_SOURCE_MEMORY /* If this source is selected, the stream comes from the user through the write system call */
} video_stream_source_t;

VIDEO_SOURCE_DEMUX selects the demultiplexer (fed either by the frontend or the DVR device) as the source of the video stream. If VIDEO_SOURCE_MEMORY is selected the stream comes from the application through the write() system call.

video_play_state_t

The following values can be returned by the VIDEO_GET_STATUS call representing the state of video playback.

typedef enum {
    VIDEO_STOPPED, /* Video is stopped */
    VIDEO_PLAYING, /* Video is currently playing */
    VIDEO_FREEZED /* Video is freezed */
} video_play_state_t;

struct video_command

The structure must be zeroed before use by the application This ensures it can be extended safely in the future.

struct video_command {
    __u32 cmd;
    __u32 flags;
    union {
        struct {
            __u64 pts;
        } stop;
        struct {
            /* 0 or 1000 specifies normal speed,
             1 specifies forward single stepping,
             -1 specifies backward single stepping,
             >>1: playback at speed/1000 of the normal speed,
             <-1: reverse playback at (-speed/1000) of the normal speed. */
            __s32 speed;
            __u32 format;
        } play;
        struct {
            __u32 data[16];
        } raw;
    }
};

video_size_t

typedef struct {
    int w;
    int h;
}
The following is the structure of a video event as it is returned by the VIDEO_GET_EVENT call.

```
struct video_event {
    s32 type;
    #define VIDEO_EVENT_SIZE_CHANGED 1
    #define VIDEO_EVENT_FRAME_RATE_CHANGED 2
    #define VIDEO_EVENT_DECODER_STOPPED 3
    #define VIDEO_EVENT_VSYNC 4
    __kernel_time_t timestamp;
    union {
        video_size_t size;
        unsigned int frame_rate; /* in frames per 1000sec */
        unsigned char vsync_field; /* unknown/odd/even/progressive */
    } u;
};
```

The VIDEO_GET_STATUS call returns the following structure informing about various states of the playback operation.

```
struct video_status {
    int video_blank; /* blank video on freeze? */
    video_play_state_t play_state; /* current state of playback */
    video_stream_source_t stream_source; /* current source (demux/memory) */
    video_format_t video_format; /* current aspect ratio of stream */
    video_displayformat_t display_format; /* selected cropping mode */
};
```

If video_blank is set video will be blanked out if the channel is changed or if playback is stopped. Otherwise, the last picture will be displayed. play_state indicates if the video is currently frozen, stopped, or being played back. The stream_source corresponds to the selected source for the video stream. It can come either from the demultiplexer or from memory. The video_format indicates the aspect ratio (one of 4:3 or 16:9) of the currently played video stream. Finally, display_format corresponds to the selected cropping mode in case the source video format is not the same as the format of the output device.

**struct video_still_picture**

An I-frame displayed via the VIDEO_STILLPICTURE call is passed on within the following structure.

```
/* pointer to and size of a single iframe in memory */
struct video_still_picture {
    char *iFrame;  /* pointer to a single iframe in memory */
    int32_t size;
};
```

**video capabilities**

A call to VIDEO_GET_CAPABILITIES returns an unsigned integer with the following bits set according to the hardware capabilities.
/* bit definitions for capabilities: */
/* can the hardware decode MPEG1 and/or MPEG2? */
#define VIDEO_CAP_MPEG1 1
#define VIDEO_CAP_MPEG2 2
/* can you send a system and/or program stream to video device? 
(you still have to open the video and the audio device but only 
send the stream to the video device) */
#define VIDEO_CAP_SYS 4
#define VIDEO_CAP_PROG 8
/* can the driver also handle SPU, NAVI and CSS encoded data? 
(CSS API is not present yet) */
#define VIDEO_CAP_SPU 16
#define VIDEO_CAP_NAVI 32
#define VIDEO_CAP_CSS 64

video_system_t

A call to VIDEO_SET_SYSTEM sets the desired video system for TV output. The following system types can be set:

typedef enum {
    VIDEO_SYSTEM_PAL,
    VIDEO_SYSTEM_NTSC,
    VIDEO_SYSTEM_PALN,
    VIDEO_SYSTEM_PALNc,
    VIDEO_SYSTEM_PALM,
    VIDEO_SYSTEM_NTSC60,
    VIDEO_SYSTEM_PAL60,
    VIDEO_SYSTEM_PALM60
} video_system_t;

struct video_highlight

Calling the ioctl VIDEO_SET_HIGHLIGHTS posts the SPU highlight information. The call expects the following format for that information:

typedef struct video_highlight {
    boolean active; /* 1=show highlight, 0=hide highlight */
    uint8_t contrast1; /* 7- 4 Pattern pixel contrast */
    /* 3- 0 Background pixel contrast */
    uint8_t contrast2; /* 7- 4 Emphasis pixel-2 contrast */
    /* 3- 0 Emphasis pixel-1 contrast */
    uint8_t color1; /* 7- 4 Pattern pixel color */
    /* 3- 0 Background pixel color */
    uint8_t color2; /* 7- 4 Emphasis pixel-2 color */
    /* 3- 0 Emphasis pixel-1 color */
    uint32_t ypos; /* 23-22 auto action mode */
    /* 21-12 start y */
    /* 9- 0 end y */
    uint32_t xpos; /* 23-22 button color number */
    /* 21-12 start x */
    /* 9- 0 end x */
} video_highlight_t;
struct video_spu

Calling VIDEO_SET_SPU deactivates or activates SPU decoding, according to the following format:

```c
typedef
struct video_spu {
    boolean active;
    int stream_id;
} video_spu_t;
```

struct video_spu_palette

The following structure is used to set the SPU palette by calling VIDEO_SPU_PALETTE:

```c
typedef
struct video_spu_palette {
    int length;
    uint8_t *palette;
} video_spu_palette_t;
```

struct video_navi_pack

In order to get the navigational data the following structure has to be passed to the ioctl VIDEO_GET_NAVI:

```c
typedef
struct video_navi_pack {
    int length; /* 0 ... 1024 */
    uint8_t data[1024];
} video_navi_pack_t;
```

video_attributes_t

The following attributes can be set by a call to VIDEO_SET_ATTRIBUTES:

```c
typedef uint16_t video_attributes_t;
/* bits: descr. */
/* 15-14 Video compression mode (0=MPEG-1, 1=MPEG-2) */
/* 13-12 TV system (0=525/60, 1=625/50) */
/* 11-10 Aspect ratio (0=4:3, 3=16:9) */
/* 9- 8 permitted display mode on 4:3 monitor (0=both, 1=only pan-sca */
/* 7  line 21-1 data present in GOP (1=yes, 0=no) */
/* 6  line 21-2 data present in GOP (1=yes, 0=no) */
/* 5- 3 source resolution (0=720x480/576, 1=704x480/576, 2=352x480/57 */
/* 2  source letterboxed (1=yes, 0=no) */
/* 0  film/camera mode (0=camera, 1=film (625/50 only)) */
```

Video Function Calls

dvb video open()

Name
dvb video open()
### Attention:

This ioctl is deprecated.

### Synopsis

```c
int open(const char *deviceName, int flags)
```

### Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>const char *deviceName</td>
<td>Name of specific video device.</td>
</tr>
<tr>
<td>int flags</td>
<td>A bit-wise OR of the following flags:</td>
</tr>
<tr>
<td>O_RDONLY</td>
<td>read-only access</td>
</tr>
<tr>
<td>O_RDWR</td>
<td>read/write access</td>
</tr>
<tr>
<td>O_NONBLOCK</td>
<td>open in non-blocking mode (blocking mode is the default)</td>
</tr>
</tbody>
</table>

### Description

This system call opens a named video device (e.g. /dev/dvb/adapter0/video0) for subsequent use. When an open() call has succeeded, the device will be ready for use. The significance of blocking or non-blocking mode is described in the documentation for functions where there is a difference. It does not affect the semantics of the open() call itself. A device opened in blocking mode can later be put into non-blocking mode (and vice versa) using the F_SETFL command of the fcntl system call. This is a standard system call, documented in the Linux manual page for fcntl. Only one user can open the Video Device in O_RDWR mode. All other attempts to open the device in this mode will fail, and an error-code will be returned. If the Video Device is opened in O_RDONLY mode, the only ioctl call that can be used is VIDEO_GET_STATUS. All other call will return an error code.

### Return Value

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENODEV</td>
<td>Device driver not loaded/available.</td>
</tr>
<tr>
<td>EINTERNAL</td>
<td>Internal error.</td>
</tr>
<tr>
<td>EBUSY</td>
<td>Device or resource busy.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>Invalid argument.</td>
</tr>
</tbody>
</table>

### dvb video close()

#### Name

dvb video close()
Synopsis

```c
int close(int fd)
```

Arguments

- `int fd` File descriptor returned by a previous call to open().

Description

This system call closes a previously opened video device.

Return Value

- **EBADF** `fd` is not a valid open file descriptor.

`dvb video write()`

Name

`dvb video write()`

**Attention:**

*This ioctl is deprecated.*

Synopsis

```c
size_t write(int fd, const void *buf, size_t count)
```

Arguments

- `int fd` File descriptor returned by a previous call to open().
- `void *buf` Pointer to the buffer containing the PES data.
- `size_t count` Size of `buf`.

Description

This system call can only be used if `VIDEO_SOURCE_MEMORY` is selected in the ioctl call `VIDEO_SELECT_SOURCE`. The data provided shall be in PES format, unless the capability allows other formats. If `O_NONBLOCK` is not specified the function will block until buffer space is available. The amount of data to be transferred is implied by `count`.

Return Value

- **EPERM** Mode `VIDEO_SOURCE_MEMORY` not selected.
- **ENOMEM** Attempted to write more data than the internal buffer can hold.
- **EBADF** `fd` is not a valid open file descriptor.
**VIDEO_STOP**

**Name**

VIDEO_STOP

**Attention:**

This ioctl is deprecated.

**Synopsis**

```c
int ioctl(fd, VIDEO_STOP, boolean mode)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_STOP for this command.</td>
</tr>
<tr>
<td>Boolean mode</td>
<td>Indicates how the screen shall be handled.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Blank screen when stop.</td>
</tr>
<tr>
<td></td>
<td>FALSE: Show last decoded frame.</td>
</tr>
</tbody>
</table>

**Description**

This ioctl is for DVB devices only. To control a V4L2 decoder use the V4L2 ioctl VIDI OC_DECODER_CMD, VIDI OC_TRY_DECODER_CMD instead.

This ioctl call asks the Video Device to stop playing the current stream. Depending on the input parameter, the screen can be blanked out or displaying the last decoded frame.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**VIDEO_PLAY**

**Name**

VIDEO_PLAY

**Attention:**

This ioctl is deprecated.

**Synopsis**

```c
int ioctl(fd, VIDEO_PLAY)
```
Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_PLAY for this command.</td>
</tr>
</tbody>
</table>

Description

This ioctl is for DVB devices only. To control a V4L2 decoder use the V4L2 `ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD` instead.

This ioctl call asks the Video Device to start playing a video stream from the selected source.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**VIDEO_FREEZE**

Name

VIDEO_FREEZE

**Attention:**

This ioctl is deprecated.

Synopsis

`int ioctl(fd, VIDEO_FREEZE)`

Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_FREEZE for this command.</td>
</tr>
</tbody>
</table>

Description

This ioctl is for DVB devices only. To control a V4L2 decoder use the V4L2 `ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD` instead.

This ioctl call suspends the live video stream being played. Decoding and playing are frozen. It is then possible to restart the decoding and playing process of the video stream using the VIDEO_CONTINUE command. If VIDEO_SOURCE_MEMORY is selected in the ioctl call VIDEO_SELECT_SOURCE, the DVB subsystem will not decode any more data until the ioctl call VIDEO_CONTINUE or VIDEO_PLAY is performed.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.
**VIDEO_CONTINUE**

**Name**

**VIDEO_CONTINUE**

*Attention:* This ioctl is deprecated.

**Synopsis**

```c
int ioctl(fd, VIDEO_CONTINUE)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int <code>fd</code></td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int <code>request</code></td>
<td>Equals VIDEO_CONTINUE for this command.</td>
</tr>
</tbody>
</table>

**Description**

This ioctl is for DVB devices only. To control a V4L2 decoder use the V4L2 `ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD` instead. This ioctl call restarts decoding and playing processes of the video stream which was played before a call to VIDEO_FREEZE was made.

**Return Value**

On success 0 is returned, on error -1 and the *errno* variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**VIDEO_SELECT_SOURCE**

**Name**

**VIDEO_SELECT_SOURCE**

*Attention:* This ioctl is deprecated.

**Synopsis**

```c
int ioctl(fd, VIDEO_SELECT_SOURCE, video_stream_source_t source)
```

**Description**

This ioctl is for DVB devices only. To control a V4L2 decoder use the V4L2 `ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD` instead. This ioctl call selects the source from which the next video stream is played.
Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_SELECT_SOURCE for this command.</td>
</tr>
<tr>
<td>video_stream_source_t source</td>
<td>Indicates which source shall be used for the Video stream.</td>
</tr>
</tbody>
</table>

Description

This ioctl is for DVB devices only. This ioctl was also supported by the V4L2 ivtv driver, but that has been replaced by the ivtv-specific IVTV_IOC_PASSTHROUGH_MODE ioctl.

This ioctl call informs the video device which source shall be used for the input data. The possible sources are demux or memory. If memory is selected, the data is fed to the video device through the write command.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

VIDEO_SET_BLANK

Name

VIDEO_SET_BLANK

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(fd, VIDEO_SET_BLANK, boolean mode)

Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_BLANK for this command.</td>
</tr>
<tr>
<td>boolean mode</td>
<td>TRUE: Blank screen when stop.</td>
</tr>
<tr>
<td></td>
<td>FALSE: Show last decoded frame.</td>
</tr>
</tbody>
</table>

Description

This ioctl call asks the Video Device to blank out the picture.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

1.3. Part II - Digital TV API
**VIDEO_GET_STATUS**

**Name**

VIDEO_GET_STATUS

**Attention:**

This ioctl is deprecated.

**Synopsis**

```c
int ioctl(int fd, VIDEO_GET_STATUS, struct video_status *status)
```

**Arguments**

- `int fd`: File descriptor returned by a previous call to open().
- `int request`: Equals VIDEO_GET_STATUS for this command.
- `struct video_status *status`: Returns the current status of the Video Device.

**Description**

This ioctl call asks the Video Device to return the current status of the device.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

**VIDEO_GET_FRAME_COUNT**

**Name**

VIDEO_GET_FRAME_COUNT

**Attention:**

This ioctl is deprecated.

**Synopsis**

```c
int ioctl(int fd, VIDEO_GET_FRAME_COUNT, __u64 *pts)
```

**Description**

This ioctl call asks the Video Device to return the current status of the device.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_GET_FRAME_COUNT for this command.</td>
</tr>
<tr>
<td>__u64 *pts</td>
<td>Returns the number of frames displayed since the decoder was started.</td>
</tr>
</tbody>
</table>

Description

This ioctl is obsolete. Do not use in new drivers. For V4L2 decoders this ioctl has been replaced by the V4L2_CID_MPEG_VIDEO_DEC_FRAME control.

This ioctl call asks the Video Device to return the number of displayed frames since the decoder was started.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

VIDEO_GET_PTS

Name

VIDEO_GET_PTS

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(int fd, VIDEO_GET_PTS, __u64 *pts)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_GET_PTS for this command.</td>
</tr>
<tr>
<td>__u64 *pts</td>
<td>Returns the 33-bit timestamp as defined in ITU T-REC-H.222.0 / ISO/IEC 13818-1. The PTS should belong to the currently played frame if possible, but may also be a value close to it like the PTS of the last decoded frame or the last PTS extracted by the PES parser.</td>
</tr>
</tbody>
</table>

Description

This ioctl is obsolete. Do not use in new drivers. For V4L2 decoders this ioctl has been replaced by the V4L2_CID_MPEG_VIDEO_DEC_PTS control.

This ioctl call asks the Video Device to return the current PTS timestamp.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

VIDEO_GET_FRAME_RATE

Name

VIDEO_GET_FRAME_RATE

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(int fd, VIDEO_GET_FRAME_RATE, unsigned int *rate)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_GET_FRAME_RATE for this command.</td>
</tr>
<tr>
<td>unsigned int *rate</td>
<td>Returns the framerate in number of frames per 1000 seconds.</td>
</tr>
</tbody>
</table>

Description

This ioctl call asks the Video Device to return the current framerate.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

VIDEO_GET_EVENT

Name

VIDEO_GET_EVENT

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(fd, VIDEO_GET_EVENT, struct video_event *ev)
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| int `fd`  | File descriptor returned by a previous call to `open()`.
| int `request` | Equals `VIDEO_GET_EVENT` for this command. |
| struct `video_event` *`ev` | Points to the location where the event, if any, is to be stored. |

Description

This ioctl is for DVB devices only. To get events from a V4L2 decoder use the V4L2 `ioctl VIDIOC_DQEVENT` ioctl instead.

This ioctl call returns an event of type `video_event` if available. If an event is not available, the behavior depends on whether the device is in blocking or non-blocking mode. In the latter case, the call fails immediately with `errno` set to `EWOULDBLOCK`. In the former case, the call blocks until an event becomes available. The standard Linux `poll()` and/or `select()` system calls can be used with the device file descriptor to watch for new events. For `select()`, the file descriptor should be included in the `exceptfds` argument, and for `poll()`, `POLLPRI` should be specified as the wake-up condition. Read-only permissions are sufficient for this ioctl call.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>EWOULDBLOCK</code></td>
<td>There is no event pending, and the device is in non-blocking mode.</td>
</tr>
<tr>
<td><code>EOVERFLOW</code></td>
<td>Overflow in event queue - one or more events were lost.</td>
</tr>
</tbody>
</table>

VIDEO_COMMAND

Name

`VIDEO_COMMAND`

Attention:

This ioctl is deprecated.

Synopsis

```c
int ioctl(int `fd`, `VIDEO_COMMAND`, struct `video_command` *`cmd`)```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int <code>fd</code></td>
<td>File descriptor returned by a previous call to <code>open()</code></td>
</tr>
<tr>
<td>int <code>request</code></td>
<td>Equals <code>VIDEO_COMMAND</code> for this command.</td>
</tr>
<tr>
<td>struct <code>video_command</code> *<code>cmd</code></td>
<td>Commands the decoder.</td>
</tr>
</tbody>
</table>
Description

This ioctl is obsolete. Do not use in new drivers. For V4L2 decoders this ioctl has been replaced by the `ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD` ioctl.

This ioctl commands the decoder. The `video_command` struct is a subset of the `v4l2_decoder_cmd` struct, so refer to the `ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD` documentation for more information.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

VIDEO_TRY_COMMAND

Name

VIDEO_TRY_COMMAND

**Attention:**

This ioctl is deprecated.

Synopsis

```c
int ioctl(int fd, VIDEO_TRY_COMMAND, struct video_command *cmd)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_TRY_COMMAND for this command.</td>
</tr>
<tr>
<td>struct video_command *cmd</td>
<td>Try a decoder command.</td>
</tr>
</tbody>
</table>

Description

This ioctl is obsolete. Do not use in new drivers. For V4L2 decoders this ioctl has been replaced by the `VIDIOC_TRY_DECODER_CMD` ioctl.

This ioctl tries a decoder command. The `video_command` struct is a subset of the `v4l2_decoder_cmd` struct, so refer to the `VIDIOC_TRY_DECODER_CMD` documentation for more information.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.
VIDEO_GET_SIZE

Name

VIDEO_GET_SIZE

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(int fd, VIDEO_GET_SIZE, video_size_t *size)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_GET_SIZE for this command.</td>
</tr>
<tr>
<td>video_size_t *size</td>
<td>Returns the size and aspect ratio.</td>
</tr>
</tbody>
</table>

Description

This ioctl returns the size and aspect ratio.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

VIDEO_SET_DISPLAY_FORMAT

Name

VIDEO_SET_DISPLAY_FORMAT

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(fd, VIDEO_SET_DISPLAY_FORMAT, video_display_format_t format)
Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_DISPLAY_FORMAT for this command.</td>
</tr>
<tr>
<td>video_display_format_t format</td>
<td>Selects the video format to be used.</td>
</tr>
</tbody>
</table>

Description

This ioctl call asks the Video Device to select the video format to be applied by the MPEG chip on the video.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**VIDEO_STILLPICTURE**

Name

VIDEO_STILLPICTURE

**Attention:**

This ioctl is deprecated.

Synopsis

```c
int ioctl(fd, VIDEO_STILLPICTURE, struct video_still_picture *sp)
```

Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_STILLPICTURE for this command.</td>
</tr>
<tr>
<td>struct video_still_picture *sp</td>
<td>Pointer to a location where an I-frame and size is stored.</td>
</tr>
</tbody>
</table>

Description

This ioctl call asks the Video Device to display a still picture (I-frame). The input data shall contain an I-frame. If the pointer is NULL, then the current displayed still picture is blanked.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.
**VIDEO_FAST_FORWARD**

**Name**

**VIDEO_FAST_FORWARD**

**Attention:**

This ioctl is deprecated.

**Synopsis**

int ioctl(fd, VIDEO_FAST_FORWARD, int nFrames)

**Arguments**

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equal to VIDEO_FAST_FORWARD for this command.</td>
</tr>
<tr>
<td>int nFrames</td>
<td>The number of frames to skip.</td>
</tr>
</tbody>
</table>

**Description**

This ioctl call asks the Video Device to skip decoding of N number of I-frames. This call can only be used if VIDEO_SOURCE_MEMORY is selected.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the [Generic Error Codes] chapter.

- EPERM: Mode VIDEO_SOURCE_MEMORY not selected.

**VIDEO_SLOWMOTION**

**Name**

**VIDEO_SLOWMOTION**

**Attention:**

This ioctl is deprecated.

**Synopsis**

int ioctl(fd, VIDEO_SLOWMOTION, int nFrames)
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_SLOWMOTION for this command.</td>
</tr>
<tr>
<td>int nFrames</td>
<td>The number of times to repeat each frame.</td>
</tr>
</tbody>
</table>

Description

This ioctl call asks the video device to repeat decoding frames N number of times. This call can only be used if VIDEO_SOURCE_MEMORY is selected.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

Attention:

This ioctl is deprecated.

VIDEO_GET_CAPABILITIES

Name

VIDEO_GET_CAPABILITIES

Synopsis

int ioctl(fd, VIDEO_GET_CAPABILITIES, unsigned int *cap)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_GET_CAPABILITIES for this command.</td>
</tr>
<tr>
<td>unsigned int *cap</td>
<td>Pointer to a location where to store the capability information.</td>
</tr>
</tbody>
</table>

Description

This ioctl call asks the video device about its decoding capabilities. On success it returns an integer which has bits set according to the defines in section ??.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.
VIDEO_SET_ID

Name

VIDEO_SET_ID

Attention:

*This ioctl is deprecated.*

Synopsis

```c
int ioctl(int fd, VIDEO_SET_ID, int id)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_ID for this command.</td>
</tr>
<tr>
<td>int id</td>
<td>video sub-stream id</td>
</tr>
</tbody>
</table>

Description

This ioctl selects which sub-stream is to be decoded if a program or system stream is sent to the video device.

Return Value

On success 0 is returned, on error -1 and the *errno* variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EINVAL</td>
<td>Invalid sub-stream id.</td>
</tr>
</tbody>
</table>

VIDEO_CLEAR_BUFFER

Name

VIDEO_CLEAR_BUFFER

Attention:

*This ioctl is deprecated.*

Synopsis

```c
int ioctl(fd, VIDEO_CLEAR_BUFFER)
```
Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_CLEAR_BUFFER for this command.</td>
</tr>
</tbody>
</table>

Description

This ioctl call clears all video buffers in the driver and in the decoder hardware.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**VIDEO_SET_STREAMTYPE**

Name

VIDEO_SET_STREAMTYPE

**Attention:**

This ioctl is deprecated.

Synopsis

```c
int ioctl(fd, VIDEO_SET_STREAMTYPE, int type)
```

Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_STREAMTYPE for this command.</td>
</tr>
<tr>
<td>int type</td>
<td>stream type</td>
</tr>
</tbody>
</table>

Description

This ioctl tells the driver which kind of stream to expect being written to it. If this call is not used the default of video PES is used. Some drivers might not support this call and always expect PES.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.
VIDEO_SET_FORMAT

Name

VIDEO_SET_FORMAT

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(fd, VIDEO_SET_FORMAT, video_format_t format)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_FORMAT for this command.</td>
</tr>
<tr>
<td>video_format_t</td>
<td>video format of TV as defined in section ??..</td>
</tr>
</tbody>
</table>

Description

This ioctl sets the screen format (aspect ratio) of the connected output device (TV) so that the output of the decoder can be adjusted accordingly.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL format is not a valid video format.

VIDEO_SET_SYSTEM

Name

VIDEO_SET_SYSTEM

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(fd, VIDEO_SET_SYSTEM, video_system_t system)
Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_FORMAT for this command.</td>
</tr>
<tr>
<td>video_system_t system</td>
<td>video system of TV output.</td>
</tr>
</tbody>
</table>

Description

This ioctl sets the television output format. The format (see section ??) may vary from the color format of the displayed MPEG stream. If the hardware is not able to display the requested format the call will return an error.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL system is not a valid or supported video system.

VIDEO_SET_HIGHLIGHT

Name

VIDEO_SET_HIGHLIGHT

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(fd, VIDEO_SET_HIGHLIGHT, video_highlight_t *vhilite)

Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_HIGHLIGHT for this command.</td>
</tr>
<tr>
<td>video_highlight_t *vhilite</td>
<td>SPU Highlight information according to section ??</td>
</tr>
</tbody>
</table>

Description

This ioctl sets the SPU highlight information for the menu access of a DVD.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.
VIDEO_SET_SPU

Name

VIDEO_SET_SPU

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(fd, VIDEO_SET_SPU, video_spu_t *spu)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_SPU for this command.</td>
</tr>
<tr>
<td>video_spu_t *spu</td>
<td>SPU decoding (de)activation and subid setting according to section ??</td>
</tr>
</tbody>
</table>

Description

This ioctl activates or deactivates SPU decoding in a DVD input stream. It can only be used, if the driver is able to handle a DVD stream.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL | input is not a valid spu setting or driver cannot handle SPU.

VIDEO_SET_SPU_PALETTE

Name

VIDEO_SET_SPU_PALETTE

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(fd, VIDEO_SET_SPU_PALETTE, video_spu_palette_t *palette)
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_SPU_PALETTE for this command.</td>
</tr>
<tr>
<td>video_spu_palette_t *palette</td>
<td>SPU palette according to section ?? .</td>
</tr>
</tbody>
</table>

Description

This ioctl sets the SPU color palette.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

- **EINVAL** input is not a valid palette or driver doesn’t handle SPU.

**VIDEO_GET_NAVI**

Name

VIDEO_GET_NAVI

*Attention:*

This ioctl is deprecated.

Synopsis

```c
int ioctl(fd, VIDEO_GET_NAVI, video_navi_pack_t *navipack)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_GET_NAVI for this command.</td>
</tr>
<tr>
<td>video_navi_pack_t *navipack</td>
<td>PCI or DSI pack (private stream 2) according to section ?? .</td>
</tr>
</tbody>
</table>

Description

This ioctl returns navigational information from the DVD stream. This is especially needed if an encoded stream has to be decoded by the hardware.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

- **EFAULT** driver is not able to return navigational information.
VIDEO_SET_ATTRIBUTES

Name

VIDEO_SET_ATTRIBUTES

Attention:

This ioctl is deprecated.

Synopsis

int ioctl(fd, VIDEO_SET_ATTRIBUTE, video_attributes_t vattr)

Arguments

+-------------------+--------------------------------------------------+
<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>int request</td>
<td>Equals VIDEO_SET_ATTRIBUTE for this command.</td>
</tr>
<tr>
<td>video_attributes_t vattr</td>
<td>video attributes according to section ??</td>
</tr>
</tbody>
</table>

Description

This ioctl is intended for DVD playback and allows you to set certain information about the stream. Some hardware may not need this information, but the call also tells the hardware to prepare for DVD playback.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL input is not a valid attribute setting.

DVB Audio Device

The DVB audio device controls the MPEG2 audio decoder of the DVB hardware. It can be accessed through /dev/dvb/adapter?/audio?. Data types and and ioctl definitions can be accessed by including linux/dvb/audio.h in your application.

Please note that some DVB cards don't have their own MPEG decoder, which results in the omission of the audio and video device.

These ioctls were also used by V4L2 to control MPEG decoders implemented in V4L2. The use of these ioctls for that purpose has been made obsolete and proper V4L2 ioctls or controls have been created to replace that functionality.

Audio Data Types

This section describes the structures, data types and defines used when talking to the audio device.
audio_stream_source_t

The audio stream source is set through the AUDIO_SELECT_SOURCE call and can take the following values, depending on whether we are replaying from an internal (demux) or external (user write) source.

```c
typedef enum {
    AUDIO_SOURCE_DEMUX,
    AUDIO_SOURCE_MEMORY
} audio_stream_source_t;
```

AUDIO_SOURCE_DEMUX selects the demultiplexer (fed either by the frontend or the DVR device) as the source of the video stream. If AUDIO_SOURCE_MEMORY is selected the stream comes from the application through the write() system call.

audio_play_state_t

The following values can be returned by the AUDIO_GET_STATUS call representing the state of audio playback.

```c
typedef enum {
    AUDIO_STOPPED,
    AUDIO_PLAYING,
    AUDIO_PAUSED
} audio_play_state_t;
```

audio_channel_select_t

The audio channel selected via AUDIO_CHANNEL_SELECT is determined by the following values.

```c
typedef enum {
    AUDIO_STEREO,
    AUDIO_MONO_LEFT,
    AUDIO_MONO_RIGHT,
    AUDIO_MONO,
    AUDIO_STEREO_SWAPPED
} audio_channel_select_t;
```

struct audio_status

The AUDIO_GET_STATUS call returns the following structure informing about various states of the playback operation.

```c
typedef struct audio_status {
    boolean AV_sync_state;
    boolean mute_state;
    audio_play_state_t play_state;
    audio_stream_source_t stream_source;
    audio_channel_select_t channel_select;
    boolean bypass_mode;
    audio_mixer_t mixer_state;
} audio_status_t;
```

struct audio_mixer

The following structure is used by the AUDIO_SET_MIXER call to set the audio volume.
typedef struct audio_mixer {
    unsigned int volume_left;
    unsigned int volume_right;
} audio_mixer_t;

audio encodings

A call to AUDIO_GET_CAPABILITIES returns an unsigned integer with the following bits set according to the hardwares capabilities.

```
#define AUDIO_CAP_DTS 1
#define AUDIO_CAP_LPCM 2
#define AUDIO_CAP_MP1 4
#define AUDIO_CAP_MP2 8
#define AUDIO_CAP_MP3 16
#define AUDIO_CAP_AAC 32
#define AUDIO_CAP_OGG 64
#define AUDIO_CAP_SDDS 128
#define AUDIO_CAP_AC3 256
```

struct audio_karaoke

The ioctl AUDIO_SET_KARAOKE uses the following format:

```
typedef struct audio_karaoke {
    int vocal1;
    int vocal2;
    int melody;
} audio_karaoke_t;
```

If Vocal1 or Vocal2 are non-zero, they get mixed into left and right t at 70% each. If both, Vocal1 and Vocal2 are non-zero, Vocal1 gets mixed into the left channel and Vocal2 into the right channel at 100% each. If Melody is non-zero, the melody channel gets mixed into left and right.

audio attributes

The following attributes can be set by a call to AUDIO_SET_ATTRIBUTES:

```
typedef uint16_t audio_attributes_t;
/* bits: descr. */
/* 15-13 audio coding mode (0=ac3, 2=mpeg1, 3=mpeg2ext, 4=LPCM, 6=DTS, */
/* 12 multichannel extension */
/* 11-10 audio type (0=not spec, 1=language included) */
/* 9- 8 audio application mode (0=not spec, 1=karaoke, 2=surround) */
/* 7- 6 Quantization / DRC (mpeg audio: 1=DRC exists)(lpcm: 0=16bit, */
/* 5- 4 Sample frequency fs (0=48kHz, 1=96kHz) */
/* 2- 0 number of audio channels (n+1 channels) */
```
Audio Function Calls

DVB audio open()

Name

DVB audio open()

**Attention:**

This ioctl is deprecated

Synopsis

```c
int open(const char *deviceName, int flags)
```

Arguments

<table>
<thead>
<tr>
<th>const char *deviceName</th>
<th>Name of specific audio device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>int flags</td>
<td>A bit-wise OR of the following flags:</td>
</tr>
<tr>
<td></td>
<td>O_RDONLY read-only access</td>
</tr>
<tr>
<td></td>
<td>O_RDWR read/write access</td>
</tr>
<tr>
<td></td>
<td>O_NONBLOCK open in non-blocking mode</td>
</tr>
<tr>
<td></td>
<td>(blocking mode is the default)</td>
</tr>
</tbody>
</table>

Description

This system call opens a named audio device (e.g. /dev/dvb/adapter0/audio0) for subsequent use. When an open() call has succeeded, the device will be ready for use. The significance of blocking or non-blocking mode is described in the documentation for functions where there is a difference. It does not affect the semantics of the open() call itself. A device opened in blocking mode can later be put into non-blocking mode (and vice versa) using the F_SETFL command of the fcntl system call. This is a standard system call, documented in the Linux manual page for fcntl. Only one user can open the Audio Device in O_RDWR mode. All other attempts to open the device in this mode will fail, and an error code will be returned. If the Audio Device is opened in O_RDONLY mode, the only ioctl call that can be used is AUDIO_GET_STATUS. All other call will return with an error code.

ReturnValue

<table>
<thead>
<tr>
<th>ENODEV</th>
<th>Device driver not loaded/available.</th>
</tr>
</thead>
<tbody>
<tr>
<td>EBUSY</td>
<td>Device or resource busy.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>Invalid argument.</td>
</tr>
</tbody>
</table>

DVB audio close()

Name

DVB audio close()
**Attention:**

This ioctl is deprecated

### Synopsis

```c
int close(int fd)
```

### Arguments

- **int fd**  
  File descriptor returned by a previous call to open().

### Description

This system call closes a previously opened audio device.

### Return Value

- **EBADF**  
  fd is not a valid open file descriptor.

### DVB audio write()

#### Name

DVB audio write()

**Attention:**

This ioctl is deprecated

### Synopsis

```c
size_t write(int fd, const void *buf, size_t count)
```

### Arguments

- **int fd**  
  File descriptor returned by a previous call to open().

- **void *buf**  
  Pointer to the buffer containing the PES data.

- **size_t count**  
  Size of buf.

### Description

This system call can only be used if AUDIO_SOURCE_MEMORY is selected in the ioctl call AU-
DIO_SELECT_SOURCE. The data provided shall be in PES format. If O_NONBLOCK is not specified the
function will block until buffer space is available. The amount of data to be transferred is implied by
count.
Return Value

<table>
<thead>
<tr>
<th>EPERM</th>
<th>Mode AUDIO_SOURCE_MEMORY not selected.</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENOMEM</td>
<td>Attempted to write more data than the internal buffer can hold.</td>
</tr>
<tr>
<td>EBADF</td>
<td>fd is not a valid open file descriptor.</td>
</tr>
</tbody>
</table>

**AUDIO_STOP**

**Name**

AUDIO_STOP

**Attention:**

*This ioctl is deprecated*

**Synopsis**

```c
int ioctl(int fd, AUDIO_STOP)
```

**Arguments**

| int fd | File descriptor returned by a previous call to open(). |

**Description**

This ioctl call asks the Audio Device to stop playing the current stream.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**AUDIO_PLAY**

**Name**

AUDIO_PLAY

**Attention:**

*This ioctl is deprecated*

**Synopsis**

```c
int ioctl(int fd, AUDIO_PLAY)
```
Arguments

| int fd | File descriptor returned by a previous call to open(). |

Description

This ioctl call asks the Audio Device to start playing an audio stream from the selected source.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

AUDIO_PAUSE

Name

AUDIO_PAUSE

Attention:

This ioctl is deprecated

Synopsis

int ioctl(int fd, AUDIO_PAUSE)

Arguments

| int fd | File descriptor returned by a previous call to open(). |

Description

This ioctl call suspends the audio stream being played. Decoding and playing are paused. It is then possible to restart again decoding and playing process of the audio stream using AUDIO_CONTINUE command.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

AUDIO_CONTINUE

Name

AUDIO_CONTINUE
**Synopsis**

int ioctl(int *fd, AUDIO_CONTINUE)

**Arguments**

| int fd | File descriptor returned by a previous call to open(). |

**Description**

This ioctl restarts the decoding and playing process previously paused with AUDIO_PAUSE command.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

**AUDIO_SELECT_SOURCE**

**Name**

AUDIO_SELECT_SOURCE

**Synopsis**

int ioctl(int *fd, AUDIO_SELECT_SOURCE, audio_stream_source_t source)

**Arguments**

| int fd | File descriptor returned by a previous call to open(). |
| audio_stream_source_t source | Indicates the source that shall be used for the Audio stream. |

**Description**

This ioctl call informs the audio device which source shall be used for the input data. The possible sources are demux or memory. If AUDIO_SOURCE_MEMORY is selected, the data is fed to the Audio Device through the write command.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**AUDIO_SET_MUTE**

Name

AUDIO_SET_MUTE

**Attention:**

This ioctl is deprecated

**Synopsis**

```c
int ioctl(int fd, AUDIO_SET_MUTE, boolean state)
```

**Arguments**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>boolean state</td>
<td>Indicates if audio device shall mute or not. TRUE: Audio Mute FALSE: Audio Un-mute</td>
</tr>
</tbody>
</table>

**Description**

This ioctl is for DVB devices only. To control a V4L2 decoder use the V4L2 ioctl VIDIOC_DECODER_CMD, VIDIOC_TRY_DECODER_CMD with the V4L2_DEC_CMD_START_MUTE_AUDIO flag instead.

This ioctl call asks the audio device to mute the stream that is currently being played.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**AUDIO_SET_AV_SYNC**

Name

AUDIO_SET_AV_SYNC

**Attention:**

This ioctl is deprecated
Synopsis

int ioctl(int fd, AUDIO_SET_AV_SYNC, boolean state)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>boolean state</td>
<td>Tells the DVB subsystem if A/V synchronization shall be ON or OFF.</td>
</tr>
<tr>
<td></td>
<td>TRUE: AV-sync ON</td>
</tr>
<tr>
<td></td>
<td>FALSE: AV-sync OFF</td>
</tr>
</tbody>
</table>

Description

This ioctl call asks the Audio Device to turn ON or OFF A/V synchronization.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

AUDIO_SET_BYPASS_MODE

Name

AUDIO_SET_BYPASS_MODE

Attention:

This ioctl is deprecated

Synopsis

int ioctl(int fd, AUDIO_SET_BYPASS_MODE, boolean mode)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>boolean mode</td>
<td>Enables or disables the decoding of the current Audio stream in the DVB subsystem.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Bypass is disabled</td>
</tr>
<tr>
<td></td>
<td>FALSE: Bypass is enabled</td>
</tr>
</tbody>
</table>
Description

This ioctl call asks the Audio Device to bypass the Audio decoder and forward the stream without decoding. This mode shall be used if streams that can’t be handled by the DVB system shall be decoded. Dolby DigitalTM streams are automatically forwarded by the DVB subsystem if the hardware can handle it.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

AUDIO_CHANNEL_SELECT

Name

AUDIO_CHANNEL_SELECT

Attention:

This ioctl is deprecated

Synopsis

int ioctl(int fd, AUDIO_CHANNEL_SELECT, audio_channel_select_t)

Arguments

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>audio_channel_select_t ch</td>
<td>Select the output format of the audio (mono left/right, stereo).</td>
</tr>
</tbody>
</table>

Description

This ioctl is for DVB devices only. To control a V4L2 decoder use the V4L2 V4L2_CID_MPEG_AUDIO_DEC_PLAYBACK control instead. This ioctl call asks the Audio Device to select the requested channel if possible.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

AUDIO_BILINGUAL_CHANNEL_SELECT

Name

AUDIO_BILINGUAL_CHANNEL_SELECT
**Attention:**

This ioctl is deprecated

## Synopsis

```
int ioctl(int fd, AUDIO_BILINGUAL_CHANNEL_SELECT, audio_channel_select_t)
```

## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>audio_channel_select_t ch</td>
<td>Select the output format of the audio (mono left/right, stereo).</td>
</tr>
</tbody>
</table>

## Description

This ioctl is obsolete. Do not use in new drivers. It has been replaced by the V4L2 V4L2_CID_MPEG_AUDIO_DEC_MULTILINGUAL_PLAYBACK control for MPEG decoders controlled through V4L2.

This ioctl call asks the Audio Device to select the requested channel for bilingual streams if possible.

## Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

## AUDIO_GET_PTS

### Name

`AUDIO_GET_PTS`

### Synopsis

```
int ioctl(int fd, AUDIO_GET_PTS, __u64 *pts)
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>__u64 *pts</td>
<td>Returns the 33-bit timestamp as defined in ITU-T-REC-H.222.0 / ISO/IEC 13818-1. The PTS should belong to the currently played frame if possible, but may also be a value close to it like the PTS of the last decoded frame or the last PTS extracted by the PES parser.</td>
</tr>
</tbody>
</table>

Description

This ioctl is obsolete. Do not use in new drivers. If you need this functionality, then please contact the linux-media mailing list (https://linuxtv.org/lists.php).

This ioctl call asks the Audio Device to return the current PTS timestamp.

ReturnValue

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

AUDIO_GET_STATUS

Name

AUDIO_GET_STATUS

Attention:

This ioctl is deprecated

Synopsis

int ioctl(int fd, AUDIO_GET_STATUS, struct audio_status *status)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int fd</td>
<td>File descriptor returned by a previous call to open().</td>
</tr>
<tr>
<td>struct audio_status *status</td>
<td>Returns the current state of Audio Device.</td>
</tr>
</tbody>
</table>

Description

This ioctl call asks the Audio Device to return the current state of the Audio Device.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**AUDIO_GET_CAPABILITIES**

**Name**

AUDIO_GET_CAPABILITIES

**Attention:**

This ioctl is deprecated

**Synopsis**

```
int ioctl(int fd, AUDIO_GET_CAPABILITIES, unsigned int *cap)
```

**Arguments**

<table>
<thead>
<tr>
<th>Int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsigned int *cap</td>
<td>Returns a bit array of supported sound formats.</td>
</tr>
</tbody>
</table>

**Description**

This ioctl call asks the Audio Device to tell us about the decoding capabilities of the audio hardware.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

**AUDIO_CLEAR_BUFFER**

**Name**

AUDIO_CLEAR_BUFFER

**Attention:**

This ioctl is deprecated

**Synopsis**

```
int ioctl(int fd, AUDIO_CLEAR_BUFFER)
```
Arguments

\begin{verbatim}
int fd  | File descriptor returned by a previous call to open().
\end{verbatim}

Description

This ioctl call asks the Audio Device to clear all software and hardware buffers of the audio decoder device.

Return Value

On success 0 is returned, on error -1 and the \texttt{errno} variable is set appropriately. The generic error codes are described at the \textit{Generic Error Codes} chapter.

\textbf{AUDIO_SET_ID}

Name

\texttt{AUDIO_SET_ID}

Attention:

\begin{quote}
This ioctl is deprecated
\end{quote}

Synopsis

\begin{verbatim}
int ioctl(int fd, AUDIO_SET_ID, int id)
\end{verbatim}

Arguments

\begin{verbatim}
int fd  | File descriptor returned by a previous call to open().
int id  | audio sub-stream id
\end{verbatim}

Description

This ioctl selects which sub-stream is to be decoded if a program or system stream is sent to the video device. If no audio stream type is set the id has to be in [0xC0,0xDF] for MPEG sound, in [0x80,0x87] for AC3 and in [0xA0,0xA7] for LPCM. More specifications may follow for other stream types. If the stream type is set the id just specifies the substream id of the audio stream and only the first 5 bits are recognized.

Return Value

On success 0 is returned, on error -1 and the \texttt{errno} variable is set appropriately. The generic error codes are described at the \textit{Generic Error Codes} chapter.
**AUDIO_SET_MIXER**

**Name**

**AUDIO_SET_MIXER**

**Attention:**

This ioctl is deprecated

**Synopsis**

```c
int ioctl(int fd, AUDIO_SET_MIXER, audio_mixer_t *mix)
```

**Arguments**

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>audio_mixer_t *mix</td>
<td>mixer settings.</td>
</tr>
</tbody>
</table>

**Description**

This ioctl lets you adjust the mixer settings of the audio decoder.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**AUDIO_SET_STREAMTYPE**

**Name**

**AUDIO_SET_STREAMTYPE**

**Attention:**

This ioctl is deprecated

**Synopsis**

```c
int ioctl(fd, AUDIO_SET_STREAMTYPE, int type)
```

**Arguments**

<table>
<thead>
<tr>
<th>int fd</th>
<th>File descriptor returned by a previous call to open().</th>
</tr>
</thead>
<tbody>
<tr>
<td>int type</td>
<td>stream type</td>
</tr>
</tbody>
</table>
Description

This ioctl tells the driver which kind of audio stream to expect. This is useful if the stream offers several audio sub-streams like LPCM and AC3.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL  type is not a valid or supported stream type.

AUDIO_SET_EXT_ID

Name

AUDIO_SET_EXT_ID

Attention:

This ioctl is deprecated

Synopsis

int ioctl(fd, AUDIO_SET_EXT_ID, int id)

Arguments

| int fd | File descriptor returned by a previous call to open(). |
| int id | audio sub_stream_id |

Description

This ioctl can be used to set the extension id for MPEG streams in DVD playback. Only the first 3 bits are recognized.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL  id is not a valid id.

AUDIO_SET_ATTRIBUTES

Name

AUDIO_SET_ATTRIBUTES
**Attention:**

This ioctl is deprecated

---

**Synopsis**

```c
int ioctl(fd, AUDIO_SET_ATTRIBUTES, audio_attributes_t attr)
```

**Arguments**

- `int fd` 
  File descriptor returned by a previous call to open().
- `audio_attributes_t attr` 
  Audio attributes according to section ??.

**Description**

This ioctl is intended for DVD playback and allows you to set certain information about the audio stream.

**Return Value**

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

- `EINVAL` 
  attr is not a valid or supported attribute setting.

---

**AUDIO_SET_KARAOKE**

**Name**

`AUDIO_SET_KARAOKE`

**Attention:**

This ioctl is deprecated

---

**Synopsis**

```c
int ioctl(fd, AUDIO_SET_KARAOKE, audio_karaoke_t *karaoke)
```

**Arguments**

- `int fd` 
  File descriptor returned by a previous call to open().
- `audio_karaoke_t *karaoke` 
  Karaoke settings according to section ??.

**Description**

This ioctl allows one to set the mixer settings for a karaoke DVD.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL karaoke is not a valid or supported karaoke setting.

1.3.8 Examples

In this section we would like to present some examples for using the DVB API.

..note:
This section is out of date, and the code below won't even compile. Please refer to the `libdvbv5 <https://linuxtv.org/docs/libdvbv5/index.html>`__ for updated/recommended examples.

Example: Tuning

We will start with a generic tuning subroutine that uses the frontend and SEC, as well as the demux devices. The example is given for QPSK tuners, but can easily be adjusted for QAM.

```c
#include <sys/ioctl.h>
#include <stdio.h>
#include <stdint.h>
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
#include <time.h>
#include <unistd.h>
#include <linux/dvb/dmx.h>
#include <linux/dvb/frontend.h>
#include <linux/dvb/sec.h>
#include <sys/poll.h>

#define DMX "/dev/dvb/adapter0/demux1"
#define FRONT "/dev/dvb/adapter0/frontend1"
#define SEC "/dev/dvb/adapter0/sec1"

/* routine for checking if we have a signal and other status information*/
int FEReadStatus(int fd, fe_status_t *stat)
{
    int ans;

    if ( (ans = ioctl(fd,FE_READ_STATUS,stat) < 0))
        perror("FE_READ_STATUS: ");
    return -1;

    if (*stat & FE_HAS_POWER)
        printf("FE_HAS_POWER\n");

    if (*stat & FE_HAS_SIGNAL)

The program assumes that you are using a universal LNB and a standard DiSEqC switch with up to 4 addresses. Of course, you could build in some more checking if tuning was successful and maybe try to repeat the tuning process. Depending on the external hardware, i.e. LNB and DiSEqC switch, and weather conditions this may be necessary.

Example: The DVR device

The following program code shows how to use the DVR device for recording.

```c
#include <sys/ioctl.h>
#include <stdio.h>
#include <stdint.h>
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
#include <time.h>
#include <unistd.h>
#include <linux/dvb/dmx.h>
#include <linux/dvb/video.h>
#include <sys/poll.h>
#define DVR "/dev/dvb/adapter0/dvr1"
```

```c
printf("completion event\n");
}
}

pesFilterParams.pid = vpid;
pesFilterParams.input = DMX_IN_FRONTEND;
pesFilterParams.output = DMX_OUT_DECODER;
pesFilterParams.pes_type = DMX_PES_VIDEO;
pesFilterParams.flags = DMX_IMMEDIATE_START;
if (ioctl(demux1, DMX_SET_PES_FILTER, &pesFilterParams) < 0){
    perror("set_vpid");
    return -1;
}

pesFilterParams.pid = apid;
pesFilterParams.input = DMX_IN_FRONTEND;
pesFilterParams.output = DMX_OUT_DECODER;
pesFilterParams.pes_type = DMX_PES_AUDIO;
pesFilterParams.flags = DMX_IMMEDIATE_START;
if (ioctl(demux2, DMX_SET_PES_FILTER, &pesFilterParams) < 0){
    perror("set_apid");
    return -1;
}

 * Scale types for the quality parameters.
 * @ FE_SCALE_NOT_AVAILABLE : That QoS measure is not available. That
 * could indicate a temporary or a permanent
 * condition.
 * @ FE_SCALE_DECIBEL : The scale is measured in 0.001 dB steps, typically
 * used on signal measures.
 * @ FE_SCALE_RELATIVE : The scale is a relative percentual measure,
 * ranging from 0 (0%) to 0xffff (100%).
 * @ FE_SCALE_COUNTER : The scale counts the occurrence of an event, like
 * bit error, block error, lapsed time.
 */
enum fecap_scale_params {
    FE_SCALE_NOT_AVAILABLE = 0,
    FE_SCALE_DECIBEL,
    FE_SCALE_RELATIVE,
    FE_SCALE_COUNTER
};

/**
 * struct dtv_stats - Used for reading a DTV status property
 */
* @value: value of the measure. Should range from 0 to 0xffff;
* @scale: Filled with enum fecap_scale_params - the scale
* in usage for that parameter
For most delivery systems, this will return a single value for each parameter. It should be noticed, however, that new OFDM delivery systems like ISDB can use different modulation types for each group of carriers. On such standards, up to 8 groups of statistics can be provided, one for each carrier group (called "layer" on ISDB). In order to be consistent with other delivery systems, the first value refers to the entire set of carriers ("global"). dtv_status:scale should use the value \texttt{FE\_SCALE\_NOT\_AVAILABLE} when the value for the entire group of carriers or from one specific layer is not provided by the hardware. st.len should be filled with the latest filled status + 1.

In other words, for ISDB, those values should be filled like:

- \texttt{u.st.stat.svalue[0]} = global statistics;
- \texttt{u.st.stat.scale[0]} = \texttt{FE\_SCALE\_DECIBEL};
- \texttt{u.st.stat.value[1]} = layer A statistics;
- \texttt{u.st.stat.scale[1]} = \texttt{FE\_SCALE\_NOT\_AVAILABLE} (if not available);
- \texttt{u.st.stat.svalue[2]} = layer B statistics;
- \texttt{u.st.stat.scale[2]} = \texttt{FE\_SCALE\_DECIBEL};
- \texttt{u.st.stat.svalue[3]} = layer C statistics;
- \texttt{u.st.stat.scale[3]} = \texttt{FE\_SCALE\_DECIBEL};
- \texttt{u.st.len} = 4;

```c

### 1.3.16 Revision History

**revision** 2.1.0 / 2015-05-29 (mcc)
DocBook improvements and cleanups, in order to document the system calls on a more standard way and provide more description about the current DVB API.

**revision** 2.0.4 / 2011-05-06 (mcc)
Add more information about DVB APIv5, better describing the frontend GET/SET props ioctl’s.

**revision** 2.0.3 / 2010-07-03 (mcc)
Add some frontend capabilities flags, present on kernel, but missing at the specs.

**revision** 2.0.2 / 2009-10-25 (mcc)
documents FE_SET_FRONTEND_TUNE_MODE and FE_DISHETWORK_SEND_LEGACY_CMD ioctls.

**revision** 2.0.1 / 2009-09-16 (mcc)
Added ISDB-T test originally written by Patrick Boettcher

**revision** 2.0.0 / 2009-09-06 (mcc)
Conversion from LaTex to DocBook XML. The contents is the same as the original LaTex version. Initial revision on LaTeX.

### 1.4 Part III - Remote Controller API

Table of Contents

#### 1.4.1 Introduction

Currently, most analog and digital devices have an Infrared input for remote controllers. Each manufacturer has their own type of control. It is not rare for the same manufacturer to ship different types of controls, depending on the device.

A Remote Controller interface is mapped as a normal evdev/input interface, just like a keyboard or a mouse. So, it uses all ioctls already defined for any other input devices.

However, remote controllers are more flexible than a normal input device, as the IR receiver (and/or transmitter) can be used in conjunction with a wide variety of different IR remotes.

In order to allow flexibility, the Remote Controller subsystem allows controlling the RC-specific attributes via the sysfs class nodes.

#### 1.4.2 Remote Controller’s sysfs nodes

As defined at Documentation/ABI/testing/sysfs-class-rc, those are the sysfs nodes that control the Remote Controllers:

```
/sys/class/rc/
```

The /sys/class/rc/ class sub-directory belongs to the Remote Controller core and provides a sysfs interface for configuring infrared remote controller receivers.
A /sys/class/rc/rcN directory is created for each remote control receiver device where N is the number of the receiver.

/sys/class/rc/rcN/protocols

Reading this file returns a list of available protocols, something like:

rc5 [rc6] nec jvc [sony]

Enabled protocols are shown in [] brackets.

Writing “+proto” will add a protocol to the list of enabled protocols.

Writing “-proto” will remove a protocol from the list of enabled protocols.

Writing “proto” will enable only “proto”.

Writing “none” will disable all protocols.

Write fails with EINVAL if an invalid protocol combination or unknown protocol name is used.

/sys/class/rc/rcN/filter

Sets the scancode filter expected value.

Use in combination with /sys/class/rc/rcN/filter_mask to set the expected value of the bits set in the filter mask. If the hardware supports it then scancodes which do not match the filter will be ignored. Otherwise the write will fail with an error.

This value may be reset to 0 if the current protocol is altered.

/sys/class/rc/rcN/filter_mask

Sets the scancode filter mask of bits to compare. Use in combination with /sys/class/rc/rcN/filter to set the bits of the scancode which should be compared against the expected value. A value of 0 disables the filter to allow all valid scancodes to be processed.

If the hardware supports it then scancodes which do not match the filter will be ignored. Otherwise the write will fail with an error.

This value may be reset to 0 if the current protocol is altered.

/sys/class/rc/rcN/wakeup_protocols

Reading this file returns a list of available protocols to use for the wakeup filter, something like:

rc5 rc6 nec jvc [sony]

The enabled wakeup protocol is shown in [] brackets.

Writing “+proto” will add a protocol to the list of enabled wakeup protocols.

Writing “-proto” will remove a protocol from the list of enabled wakeup protocols.

Writing “proto” will use “proto” for wakeup events.

Writing “none” will disable wakeup.

Write fails with EINVAL if an invalid protocol combination or unknown protocol name is used, or if wakeup is not supported by the hardware.
/sys/class/rc/rcN/wakeup_filter

Sets the scancode wakeup filter expected value. Use in combination with /sys/class/rc/rcN/wakeup_filter_mask to set the expected value of the bits set in the wakeup filter mask to trigger a system wake event.

If the hardware supports it and wakeup_filter_mask is not 0 then scancodes which match the filter will wake the system from e.g. suspend to RAM or power off. Otherwise the write will fail with an error.

This value may be reset to 0 if the wakeup protocol is altered.

/sys/class/rc/rcN/wakeup_filter_mask

Sets the scancode wakeup filter mask of bits to compare. Use in combination with /sys/class/rc/rcN/wakeup_filter to set the bits of the scancode which should be compared against the expected value to trigger a system wake event.

If the hardware supports it and wakeup_filter_mask is not 0 then scancodes which match the filter will wake the system from e.g. suspend to RAM or power off. Otherwise the write will fail with an error.

This value may be reset to 0 if the wakeup protocol is altered.

1.4.3 Remote controller tables

Unfortunately, for several years, there was no effort to create uniform IR keycodes for different devices. This caused the same IR keyname to be mapped completely differently on different IR devices. This resulted that the same IR keyname to be mapped completely different on different IR’s. Due to that, V4L2 API now specifies a standard for mapping Media keys on IR.

This standard should be used by both V4L/DVB drivers and userspace applications.

The modules register the remote as keyboard within the linux input layer. This means that the IR key strokes will look like normal keyboard key strokes (if CONFIG_INPUT_KEYBOARD is enabled). Using the event devices (CONFIG_INPUT_EVDEV) it is possible for applications to access the remote via /dev/input/event devices.

</tr>
</tbody>
</table>

### Miscellaneous keys

<table>
<thead>
<tr>
<th>KEY</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY_DOT</td>
<td>Return a dot</td>
<td>.</td>
</tr>
<tr>
<td>KEY_FN</td>
<td>Select a function</td>
<td>FUNCTION</td>
</tr>
</tbody>
</table>

It should be noted that, sometimes, there some fundamental missing keys at some cheaper IR’s. Due to
that, it is recommended to:

Table 1.189: Notes

| On simpler IR’s, without separate channel keys, you need to map UP as KEY_CHANNELUP |
| On simpler IR’s, without separate channel keys, you need to map DOWN as KEY_CHANNELDOWN |
| On simpler IR’s, without separate volume keys, you need to map LEFT as KEY_VOLUMEDOWN |
| On simpler IR’s, without separate volume keys, you need to map RIGHT as KEY_VOLUMEDOWN |

1.4.4 Changing default Remote Controller mappings

The event interface provides two ioctls to be used against the /dev/input/event device, to allow changing the default keymapping.

This program demonstrates how to replace the keymap tables.

file: uapi/v4l/keytable.c

```c
/* keytable.c - This program allows checking/replacing keys at IR */

#include <ctype.h>
#include <errno.h>
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <linux/input.h>
#include <sys/ioctl.h>
#include "parse.h"

void prtcode (int *codes)
{
    struct parse_key *p;

    for (p=keynames;p->name!=NULL;p++) {
        if (p->value == (unsigned)codes[1]) {
            printf("scancode 0x%04x = %s (0x%02x)\n", codes[0], p->name, codes[1]);
            return;
        }
    }

    if (isprint (codes[1]))
        printf("scancode %d = 'c' (0x%02x)\n", codes[0], codes[1], codes[1]);
    else
        printf("scancode %d = 0x%02x\n", codes[0], codes[1]);
}
```
int parse_code(char *string)
{
    struct parse_key *p;

    for (p=keynames;p->name!=NULL;p++) {
        if (!strcasecmp(p->name, string)) {

    }
}
1.4.5 LIRC Device Interface

Introduction

The LIRC device interface is a bi-directional interface for transporting raw IR data between userspace and kernelspace. Fundamentally, it is just a chardev (/dev/lircX, for X = 0, 1, 2, ...), with a number of standard struct file_operations defined on it. With respect to transporting raw IR data to and fro, the essential fops are read, write and ioctl.

Example dmesg output upon a driver registering w/LIRC:

```bash
$ dmesg |grep lirc_dev
lirc_dev: IR Remote Control driver registered, major 248
rc rc0: lirc_dev: driver ir-lirc-codec (mceusb) registered at minor = 0
```

What you should see for a chardev:

```bash
$ ls -l /dev/lirc*
crw-rw---- 1 root root 248, 0 Jul 2 22:20 /dev/lirc0
```

LIRC modes

LIRC supports some modes of receiving and sending IR codes, as shown on the following table.

- **LIRC_MODE_MODE2**
  - The driver returns a sequence of pulse and space codes to userspace.
  - This mode is used only for IR receive.

- **LIRC_MODE_LIRCCODE**
  - The IR signal is decoded internally by the receiver. The LIRC interface returns the scancode as an integer value. This is the usual mode used by several TV media cards.
  - This mode is used only for IR receive.

- **LIRC_MODE_PULSE**
  - On puse mode, a sequence of pulse/space integer values are written to the lirc device using `LIRC_write()`.
  - This mode is used only for IR send.

LIRC Function Reference

**LIRC read()**

Name

lirc-read - Read from a LIRC device
Synopsis

```
#include <unistd.h>

ssize_t read(int fd, void *buf, size_t count)
:name lirc-read()
```

Arguments

- **fd** File descriptor returned by `open()`.
- **buf** Buffer to be filled
- **count** Max number of bytes to read

Description

`read()` attempts to read up to `count` bytes from file descriptor `fd` into the buffer starting at `buf`. If `count` is zero, `read()` returns zero and has no other results. If `count` is greater than `SSIZE_MAX`, the result is unspecified.

The `lircd` userspace daemon reads raw IR data from the LIRC chardev. The exact format of the data depends on what modes a driver supports, and what mode has been selected. `lircd` obtains supported modes and sets the active mode via the ioctl interface, detailed at [LIRC Function Reference](http://www.lirc.org/html/technical.html). The generally preferred mode for receive is `LIRC_MODE_MODE2`, in which packets containing an int value describing an IR signal are read from the chardev.

Return Value

On success, the number of bytes read is returned. It is not an error if this number is smaller than the number of bytes requested, or the amount of data required for one frame. On error, -1 is returned, and the `errno` variable is set appropriately.

**LIRC write()**

Name

lirc-write - Write to a LIRC device

Synopsis

```
#include <unistd.h>

ssize_t write(int fd, void *buf, size_t count)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **buf** Buffer with data to be written
- **count** Number of bytes at the buffer
Description

`write()` writes up to `count` bytes to the device referenced by the file descriptor `fd` from the buffer starting at `buf`.

The data written to the chardev is a pulse/space sequence of integer values. Pulses and spaces are only marked implicitly by their position. The data must start and end with a pulse, therefore, the data must always include an uneven number of samples. The write function must block until the data has been transmitted by the hardware. If more data is provided than the hardware can send, the driver returns `EINVAL`.

Return Value

On success, the number of bytes read is returned. It is not an error if this number is smaller than the number of bytes requested, or the amount of data required for one frame. On error, -1 is returned, and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

ioctl LIRC_GET_FEATURES

Name

LIRC_GET_FEATURES - Get the underlying hardware device's features

Synopsis

```c
int ioctl(int fd, LIRC_GET_FEATURES, __u32 *features)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `features` Bitmask with the LIRC features.

Description

Get the underlying hardware device’s features. If a driver does not announce support of certain features, calling of the corresponding ioctls is undefined.

LIRC features

- `LIRC_CAN_REC_RAW` Unused. Kept just to avoid breaking uAPI.
- `LIRC_CAN_REC_PULSE` The driver is capable of receiving using `LIRC_MODE_PULSE`.
- `LIRC_CAN_REC_MODE2` The driver is capable of receiving using `LIRC_MODE_MODE2`.
- `LIRC_CAN_REC_LIRCCODE` The driver is capable of receiving using `LIRC_MODE_LIRCCODE`. 

516 Chapter 1. Linux Media Infrastructure userspace API
LIRC_CAN_SET_SEND_CARRIER
The driver supports changing the modulation frequency via `ioctl LIRC_SET_SEND_CARRIER`.

LIRC_CAN_SET_SEND_DUTY_CYCLE
The driver supports changing the duty cycle using `ioctl LIRC_SET_SEND_DUTY_CYCLE`.

LIRC_CAN_SET_TRANSMITTER_MASK
The driver supports changing the active transmitter(s) using `ioctl LIRC_SET_TRANSMITTER_MASK`.

LIRC_CAN_SET_REC_CARRIER
The driver supports setting the receive carrier frequency using `ioctl LIRC_SET_REC_CARRIER`.

LIRC_CAN_SET_REC_DUTY_CYCLE_RANGE
Unused. Kept just to avoid breaking uAPI.

LIRC_CAN_SET_REC_CARRIER_RANGE
The driver supports `ioctl LIRC_SET_REC_CARRIER_RANGE`.

LIRC_CAN_SET_REC_RESOLUTION
The driver supports `ioctl LIRC_GET_REC_RESOLUTION`.

LIRC_CAN_SET_REC_TIMEOUT
The driver supports `ioctl LIRC_SET_REC_TIMEOUT`.

LIRC_CAN_SET_REC_FILTER
Unused. Kept just to avoid breaking uAPI.

LIRC_CAN_MEASURE_CARRIER
The driver supports measuring of the modulation frequency using `ioctl LIRC_SET_MEASURE_CARRIER_MODE`.

LIRC_CAN_USE_WIDEBAND_RECEIVER
The driver supports learning mode using `ioctl LIRC_SET_WIDEBAND RECEIVER`.

LIRC_CAN_NOTIFY_DECODE
Unused. Kept just to avoid breaking uAPI.

LIRC_CAN_SEND_RAW
Unused. Kept just to avoid breaking uAPI.

LIRC_CAN_SEND_PULSE
The driver supports sending using `LIRC_MODE_PULSE`.

LIRC_CAN_SEND_MODE2
The driver supports sending using `LIRC_MODE_MODE2`.

LIRC_CAN_SEND_LIRCCODE
The driver supports sending codes (also called as IR blasting or IR TX).

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.
ioctl\s LIRC\_GET\_SEND\_MODE and LIRC\_SET\_SEND\_MODE

Name

LIRC\_GET\_SEND\_MODE/LIRC\_SET\_SEND\_MODE - Get/set supported transmit mode.

Synopsis

\texttt{int ioctl}\ (\texttt{int fd, LIRC\_GET\_SEND\_MODE, __u32 *tx\_modes})
\texttt{int ioctl}\ (\texttt{int fd, LIRC\_SET\_SEND\_MODE, __u32 *tx\_modes})

Arguments

\texttt{fd} File descriptor returned by open().
\texttt{tx\_modes} Bitmask with the supported transmit modes.

Description

Get/set supported transmit mode.

Only \texttt{LIRC\_MODE\_PULSE} is supported by for IR send.

Return Value

On success 0 is returned, on error -1 and the \texttt{errno} variable is set appropriately. The generic error codes are described at the \textit{Generic Error Codes} chapter.

ioctl\s LIRC\_GET\_REC\_MODE and LIRC\_SET\_REC\_MODE

Name

LIRC\_GET\_REC\_MODE/LIRC\_SET\_REC\_MODE - Get/set supported receive modes.

Synopsis

\texttt{int ioctl}\ (\texttt{int fd, LIRC\_GET\_REC\_MODE, __u32 rx\_modes})
\texttt{int ioctl}\ (\texttt{int fd, LIRC\_SET\_REC\_MODE, __u32 rx\_modes})

Arguments

\texttt{fd} File descriptor returned by open().
\texttt{rx\_modes} Bitmask with the supported transmit modes.

Description

Get/set supported receive modes. Only \texttt{LIRC\_MODE\_MODE2} and \texttt{LIRC\_MODE\_LIRCCODE} are supported for IR receive.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_GET_REC_RESOLUTION

Name

LIRC_GET_REC_RESOLUTION - Obtain the value of receive resolution, in microseconds.

Synopsis

int ioctl(int fd, LIRC_GET_REC_RESOLUTION, __u32 *microseconds)

Arguments

fd  File descriptor returned by open().
microseconds  Resolution, in microseconds.

Description

Some receivers have maximum resolution which is defined by internal sample rate or data format limitations. E.g. it’s common that signals can only be reported in 50 microsecond steps.

This ioctl returns the integer value with such resolution, with can be used by userspace applications like lircd to automatically adjust the tolerance value.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_SET_SEND_DUTY_CYCLE

Name

LIRC_SET_SEND_DUTY_CYCLE - Set the duty cycle of the carrier signal for IR transmit.

Synopsis

int ioctl(int fd, LIRC_SET_SEND_DUTY_CYCLE, __u32 *duty_cycle)

Arguments

fd  File descriptor returned by open().
duty_cycle  Duty cycle, describing the pulse width in percent (from 1 to 99) of the total cycle. Values 0 and 100 are reserved.
Description

Get/set the duty cycle of the carrier signal for IR transmit.
Currently, no special meaning is defined for 0 or 100, but this could be used to switch off carrier generation in the future, so these values should be reserved.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctls LIRC_GET_MIN_TIMEOUT and LIRC_GET_MAX_TIMEOUT

Name

LIRC_GET_MIN_TIMEOUT / LIRC_GET_MAX_TIMEOUT - Obtain the possible timeout range for IR receive.

Synopsis

```c
int ioctl(int fd, LIRC_GET_MIN_TIMEOUT, __u32 *timeout)
int ioctl(int fd, LIRC_GET_MAX_TIMEOUT, __u32 *timeout)
```

Arguments

- `fd` File descriptor returned by open().
- `timeout` Timeout, in microseconds.

Description

Some devices have internal timers that can be used to detect when there's no IR activity for a long time. This can help lircd in detecting that an IR signal is finished and can speed up the decoding process. Returns an integer value with the minimum/maximum timeout that can be set.

**Note:**

Some devices have a fixed timeout, in that case both ioctls will return the same value even though the timeout cannot be changed via ioctl LIRC_SET_REC_TIMEOUT.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.
ioctl LIRC_SET_REC_TIMEOUT

Name

LIRC_SET_REC_TIMEOUT - sets the integer value for IR inactivity timeout.

Synopsis

```c
int ioctl(int fd, LIRC_SET_REC_TIMEOUT, __u32 *timeout)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `timeout` Timeout, in microseconds.

Description

Sets the integer value for IR inactivity timeout.

If supported by the hardware, setting it to 0 disables all hardware timeouts and data should be reported as soon as possible. If the exact value cannot be set, then the next possible value _greater_ than the given value should be set.

**Note:**

The range of supported timeout is given by `ioctl LIRC_GET_MIN_TIMEOUT` and `LIRC_GET_MAX_TIMEOUT`.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

ioctl LIRC_GET_LENGTH

Name

LIRC_GET_LENGTH - Retrieves the code length in bits.

Synopsis

```c
int ioctl(int fd, LIRC_GET_LENGTH, __u32 *length)
```

Arguments

- `fd` File descriptor returned by `open()`.
- `length` length, in bits
Description

Retrieves the code length in bits (only for LIRC-MODE-LIRCCODE). Reads on the device must be done in blocks matching the bit count. The bit count should be rounded up so that it matches full bytes.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_SET_REC_CARRIER

Name

LIRC_SET_REC_CARRIER - Set carrier used to modulate IR receive.

Synopsis

```c
int ioctl(int fd, LIRC_SET_REC_CARRIER, __u32 *frequency)
```

Arguments

- **fd** File descriptor returned by open().
- **frequency** Frequency of the carrier that modulates PWM data, in Hz.

Description

Set receive carrier used to modulate IR PWM pulses and spaces.

**Note:**

If called together with ioctl LIRC_SET_REC_CARRIER_RANGE, this ioctl sets the upper bound frequency that will be recognized by the device.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_SET_REC_CARRIER_RANGE

Name

LIRC_SET_REC_CARRIER_RANGE - Set lower bond of the carrier used to modulate IR receive.
Synopsis

```c
int ioctl(int fd, LIRC_SET_REC_CARRIER_RANGE, __u32 *frequency)
```

Arguments

- `fd` File descriptor returned by open().
- `frequency` Frequency of the carrier that modulates PWM data, in Hz.

Description

This ioctl sets the upper range of carrier frequency that will be recognized by the IR receiver.

```
Note:
To set a range use LIRC_SET_REC_CARRIER_RANGE with the lower bound first and later call LIRC_SET_REC_CARRIER with the upper bound.
```

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

**ioctl LIRC_SET_SEND_CARRIER**

Name

LIRC_SET_SEND_CARRIER - Set send carrier used to modulate IR TX.

Synopsis

```c
int ioctl(int fd, LIRC_SET_SEND_CARRIER, __u32 *frequency)
```

Arguments

- `fd` File descriptor returned by open().
- `frequency` Frequency of the carrier to be modulated, in Hz.

Description

Set send carrier used to modulate IR PWM pulses and spaces.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.
ioctl LIRC_SET_TRANSMITTER_MASK

Name

LIRC_SET_TRANSMITTER_MASK - Enables send codes on a given set of transmitters

Synopsis

int ioctl(int fd, LIRC_SET_TRANSMITTER_MASK, __u32 *mask)

Arguments

fd  File descriptor returned by open().
mask  Mask with channels to enable tx. Channel 0 is the least significant bit.

Description

Some IR TX devices have multiple output channels, in such case, LIRC_CAN_SET_TRANSMITTER_MASK is returned via ioctl LIRC_GET_FEATURES and this ioctl sets what channels will send IR codes.

This ioctl enables the given set of transmitters. The first transmitter is encoded by the least significant bit and so on.

When an invalid bit mask is given, i.e. a bit is set, even though the device does not have so many transitters, then this ioctl returns the number of available transitters and does nothing otherwise.

ReturnValue

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl LIRC_SET_REC_TIMEOUT_REPORTS

Name

LIRC_SET_REC_TIMEOUT_REPORTS - enable or disable timeout reports for IR receive

Synopsis

int ioctl(int fd, LIRC_SET_REC_TIMEOUT_REPORTS, __u32 *enable)

Arguments

fd  File descriptor returned by open().
enable  enable = 1 means enable timeout report, enable = 0 means disable timeout reports.
Enable or disable timeout reports for IR receive. By default, timeout reports should be turned off.

**Note:**

*This ioctl is only valid for LIRC_MODE_MODE2.*

---

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

```c
int ioctl(int fd, LIRC_SET_MEASURE_CARRIER_MODE, __u32 *enable)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `enable` `enable = 1` means enable measure mode, `enable = 0` means disable measure mode.

**Description**

Enable or disable measure mode. If enabled, from the next key press on, the driver will send `LIRC_MODE2_FREQUENCY` packets. By default this should be turned off.

**Return Value**

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

```c
int ioctl(int fd, LIRC_SET_WIDEBAND_RECEIVER, __u32 *enable)
```

**Arguments**

- `fd` File descriptor returned by `open()`.
- `enable` `enable = 1` means enable wide band receiver.

**Description**

LIRC_SET_WIDEBAND_RECEIVER - enable wide band receiver.
Arguments

**fd** File descriptor returned by open().

**enable** enable = 1 means enable wideband receiver, enable = 0 means disable wideband receiver.

Description

Some receivers are equipped with special wide band receiver which is intended to be used to learn output of existing remote. This ioctl allows enabling or disabling it.

This might be useful of receivers that have otherwise narrow band receiver that prevents them to be used with some remotes. Wide band receiver might also be more precise. On the other hand its disadvantage it usually reduced range of reception.

**Note:**

Wide band receiver might be implicitly enabled if you enable carrier reports. In that case it will be disabled as soon as you disable carrier reports. Trying to disable wide band receiver while carrier reports are active will do nothing.

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

1.4.7 Revision History

**revision** 3.15 / 2014-02-06 (mcc)
Added the interface description and the RC sysfs class description.

**revision** 1.0 / 2009-09-06 (mcc)
Initial revision

1.5 Part IV - Media Controller API

Table of Contents

1.5.1 Introduction

Media devices increasingly handle multiple related functions. Many USB cameras include microphones, video capture hardware can also output video, or SoC camera interfaces also perform memory-to-memory operations similar to video codecs.

Independent functions, even when implemented in the same hardware, can be modelled as separate devices. A USB camera with a microphone will be presented to userspace applications as V4L2 and ALSA capture devices. The devices' relationships (when using a webcam, end-users shouldn't have to manually select the associated USB microphone), while not made available directly to applications by the drivers, can usually be retrieved from sysfs.

With more and more advanced SoC devices being introduced, the current approach will not scale. Device topologies are getting increasingly complex and can't always be represented by a tree structure. Hardware blocks are shared between different functions, creating dependencies between seemingly unrelated devices.

Kernel abstraction APIs such as V4L2 and ALSA provide means for applications to access hardware parameters. As newer hardware expose an increasingly high number of those parameters, drivers need to guess what applications really require based on limited information, thereby implementing policies that belong to userspace.

The media controller API aims at solving those problems.

1.5.2 Media device model

Discovering a device internal topology, and configuring it at runtime, is one of the goals of the media controller API. To achieve this, hardware devices and Linux Kernel interfaces are modelled as graph objects on an oriented graph. The object types that constitute the graph are:

- **An entity** is a basic media hardware or software building block. It can correspond to a large variety of logical blocks such as physical hardware devices (CMOS sensor for instance), logical hardware devices (a building block in a System-on-Chip image processing pipeline), DMA channels or physical connectors.

- **An interface** is a graph representation of a Linux Kernel userspace API interface, like a device node or a sysfs file that controls one or more entities in the graph.

- **A pad** is a data connection endpoint through which an entity can interact with other entities. Data (not restricted to video) produced by an entity flows from the entity’s output to one or more entity inputs. Pads should not be confused with physical pins at chip boundaries.
• A **data link** is a point-to-point oriented connection between two pads, either on the same entity or on different entities. Data flows from a source pad to a sink pad.

• An **interface link** is a point-to-point bidirectional control connection between a Linux Kernel interface and an entity.

### 1.5.3 Types and flags used to represent the media graph elements

Table 1.190: Media entity types

<table>
<thead>
<tr>
<th>Media Entity Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>MEDIA_ENT_F_UNKNOWN</code> and <code>MEDIA_ENT_F_V4L2_SUBDEV_UNKNOWN</code></td>
<td>Unknown entity. That generally indicates that a driver didn’t initialize properly the entity, with is a Kernel bug</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_IO_V4L</code></td>
<td>Data streaming input and/or output entity.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_IO_VBI</code></td>
<td>V4L VBI streaming input or output entity.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_IO_SWRADIO</code></td>
<td>V4L Software Digital Radio (SDR) streaming input or output entity.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_IO_DTV</code></td>
<td>DVB Digital TV streaming input or output entity.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_DTV_DEMOD</code></td>
<td>Digital TV demodulator entity.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_TS_DEMUX</code></td>
<td>MPEG Transport stream demux entity. Could be implemented on hardware or in Kernelspace by the Linux DVB subsystem.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_DTV_CA</code></td>
<td>Digital TV Conditional Access module (CAM) entity</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_DTV_NET_DECAP</code></td>
<td>Digital TV network ULE/MLE desencapsulation entity. Could be implemented on hardware or in Kernelspace</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_CONN_RF</code></td>
<td>Connector for a Radio Frequency (RF) signal.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_CONN_SVIDEO</code></td>
<td>Connector for a S-Video signal.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_CONN_COMPOSITE</code></td>
<td>Connector for a RGB composite signal.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_CAM_SENSOR</code></td>
<td>Camera video sensor entity.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_FLASH</code></td>
<td>Flash controller entity.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_LENS</code></td>
<td>Lens controller entity.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_ATV_DECODER</code></td>
<td>Analog video decoder, the basic function of the video decoder is to accept analogue video from a wide variety of sources such as broadcast, DVD players, cameras and video cassette recorders, in either NTSC, PAL, SECAM or HD format, separating the stream into its component parts, luminance and chrominance, and output it in some digital video standard, with appropriate timing signals.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_TUNER</code></td>
<td>Digital TV, analog TV, radio and/or software radio tuner, with consists on a PLL tuning stage that converts radio frequency (RF) signal into an Intermediate Frequency (IF). Modern tuners have internally IF-PLL decoders for audio and video, but older models have those stages implemented on separate entities.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_IF_VID_DECODER</code></td>
<td>IF-PLL video decoder. It receives the IF from a PLL and decodes the analog TV video signal. This is commonly found on some very old analog tuners, like Philips MK3 designs. They all contain a tda9887 (or some software compatible similar chip, like tda9885). Those devices use a different I2C address than the tuner PLL.</td>
</tr>
<tr>
<td><code>MEDIA_ENT_F_IF_AUD_DECODER</code></td>
<td>IF-PLL sound decoder. It receives the IF from a PLL and decodes the analog TV audio signal. This is commonly found on some very old analog hardware, like Micronas msp3400, Philips tda9840, tda985x, etc. Those devices use a different I2C address than the tuner PLL and should be controlled together with the IF-PLL video decoder.</td>
</tr>
</tbody>
</table>

Table 1.190 – continued from previous page

<table>
<thead>
<tr>
<th>Function Entity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEDIA_ENT_F_AUDIO_CAPTURE</td>
<td>Audio Capture Function Entity.</td>
</tr>
<tr>
<td>MEDIA_ENT_F_AUDIO_PLAYBACK</td>
<td>Audio Playback Function Entity.</td>
</tr>
<tr>
<td>MEDIA_ENT_F_AUDIO_MIXER</td>
<td>Audio Mixer Function Entity.</td>
</tr>
<tr>
<td>MEDIA_ENT_F_PROC_VIDEO_COMPOSER</td>
<td>Video composer (blender). An entity capable of video composing must have at least two sink pads and one source pad, and composes input video frames onto output video frames. Composition can be performed using alpha blending, color keying, raster operations (ROP), stitching or any other means.</td>
</tr>
<tr>
<td>MEDIA_ENT_F_PROC_VIDEO_PIXEL_FORMATTER</td>
<td>Video pixel formatter. An entity capable of pixel formatting must have at least one sink pad and one source pad. Read pixel formatters read pixels from memory and perform a subset of unpacking, cropping, color keying, alpha multiplication and pixel encoding conversion. Write pixel formatters perform a subset of dithering, pixel encoding conversion and packing and write pixels to memory.</td>
</tr>
<tr>
<td>MEDIA_ENT_F_PROC_VIDEO_PIXEL_ENC_CONV</td>
<td>Video pixel encoding converter. An entity capable of pixel encoding conversion must have at least one sink pad and one source pad, and convert the encoding of pixels received on its sink pad(s) to a different encoding output on its source pad(s). Pixel encoding conversion includes but isn’t limited to RGB to/from HSV, RGB to/from YUV and CFA (Bayer) to RGB conversions.</td>
</tr>
<tr>
<td>MEDIA_ENT_F_PROC_VIDEO_LUT</td>
<td>Video look-up table. An entity capable of video lookup table processing must have one sink pad and one source pad. It uses the values of the pixels received on its sink pad to look up entries in internal tables and output them on its source pad. The lookup processing can be performed on all components separately or combine them for multi-dimensional table lookups.</td>
</tr>
<tr>
<td>MEDIA_ENT_F_PROC_VIDEO_SCALER</td>
<td>Video scaler. An entity capable of video scaling must have at least one sink pad and one source pad, and scale the video frame(s) received on its sink pad(s) to a different resolution output on its source pad(s). The range of supported scaling ratios is entity-specific and can differ between the horizontal and vertical directions (in particular scaling can be supported in one direction only). Binning and skipping are considered as scaling.</td>
</tr>
<tr>
<td>MEDIA_ENT_F_PROC_VIDEO_STATISTICS</td>
<td>Video statistics computation (histogram, 3A, ...). An entity capable of statistics computation must have one sink pad and one source pad. It computes statistics over the frames received on its sink pad and outputs the statistics data on its source pad.</td>
</tr>
</tbody>
</table>

Table 1.191: Media entity flags

<tr>
<td>MEDIA_intf_t_alsa_rawmidi</td>
<td>Device node interface for ALSA Raw MIDI</td>
<td>typically, /dev/snd/midi?</td>
</tr>
<tr>
<td>MEDIA_intf_t_alsa_hwdep</td>
<td>Device node interface for ALSA Hardware Dependent</td>
<td>typically, /dev/snd/hwC?D?</td>
</tr>
<tr>
<td>MEDIA_intf_t_alsa_sequencer</td>
<td>Device node interface for ALSA Sequencer</td>
<td>typically, /dev/snd/seq</td>
</tr>
<tr>
<td>MEDIA_intf_t_alsa_timer</td>
<td>Device node interface for ALSA Timer</td>
<td>typically, /dev/snd/timer</td>
</tr>
</tbody>
</table>
Table 1.193: Media pad flags

<table>
<thead>
<tr>
<th>MEDIA_PAD_FL_SINK</th>
<th>Input pad, relative to the entity. Input pads sink data and are targets of links.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEDIA_PAD_FL_SOURCE</td>
<td>Output pad, relative to the entity. Output pads source data and are origins of links.</td>
</tr>
<tr>
<td>MEDIA_PAD_FL_MUST_CONNECT</td>
<td>If this flag is set and the pad is linked to any other pad, then at least one of those links must be enabled for the entity to be able to stream. There could be temporary reasons (e.g. device configuration dependent) for the pad to need enabled links even when this flag isn't set; the absence of the flag doesn't imply there is none.</td>
</tr>
</tbody>
</table>

One and only one of MEDIA_PAD_FL_SINK and MEDIA_PAD_FL_SOURCE must be set for every pad.

Table 1.194: Media link flags

<table>
<thead>
<tr>
<th>MEDIA_LNK_FL_ENABLED</th>
<th>The link is enabled and can be used to transfer media data. When two or more links target a sink pad, only one of them can be enabled at a time.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEDIA_LNK_FL_IMMUTABLE</td>
<td>The link enabled state can’t be modified at runtime. An immutable link is always enabled.</td>
</tr>
<tr>
<td>MEDIA_LNK_FL_DYNAMIC</td>
<td>The link enabled state can be modified during streaming. This flag is set by drivers and is read-only for applications.</td>
</tr>
<tr>
<td>MEDIA_LNK_FL_LINK_TYPE</td>
<td>This is a bitmask that defines the type of the link. Currently, two types of links are supported: MEDIA_LNK_FL_DATA_LINK if the link is between two pads MEDIA_LNK_FL_INTERFACE_LINK if the link is between an interface and an entity</td>
</tr>
</tbody>
</table>

1.5.4 Function Reference

media open()

Name

media-open - Open a media device

Synopsis

```c
#include <fcntl.h>

int open(const char *device_name, int flags)
```

Arguments

device_name Device to be opened.
flags Open flags. Access mode must be either O_RDONLY or O_RDWR. Other flags have no effect.
Description

To open a media device applications call `open()` with the desired device name. The function has no side effects; the device configuration remain unchanged.

When the device is opened in read-only mode, attempts to modify its configuration will result in an error, and `errno` will be set to EBADF.

Return Value

`open()` returns the new file descriptor on success. On error, -1 is returned, and `errno` is set appropriately. Possible error codes are:

- **EACCES** The requested access to the file is not allowed.
- **EMFILE** The process already has the maximum number of files open.
- **ENFILE** The system limit on the total number of open files has been reached.
- **ENOMEM** Insufficient kernel memory was available.
- **ENXIO** No device corresponding to this device special file exists.

media close()

Name

media-close - Close a media device

Synopsis

```c
#include <unistd.h>

int close(int fd)
```

Arguments

- **fd** File descriptor returned by `open()`.

Description

Closes the media device. Resources associated with the file descriptor are freed. The device configuration remain unchanged.

Return Value

`close()` returns 0 on success. On error, -1 is returned, and `errno` is set appropriately. Possible error codes are:

- **EBADF** `fd` is not a valid open file descriptor.
media ioctl()

Name

media_ioctl - Control a media device

Synopsis

```c
#include <sys/ioctl.h>

int ioctl(int fd, int request, void *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **request** Media ioctl request code as defined in the media.h header file, for example MEDIA_IOC_SETUP_LINK.
- **argp** Pointer to a request-specific structure.

Description

The `ioctl()` function manipulates media device parameters. The argument `fd` must be an open file descriptor.

The ioctl request code specifies the media function to be called. It has encoded in it whether the argument is an input, output or read/write parameter, and the size of the argument `argp` in bytes.

Macros and structures definitions specifying media ioctl requests and their parameters are located in the media.h header file. All media ioctl requests, their respective function and parameters are specified in Function Reference.

ReturnValue

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

Request-specific error codes are listed in the individual requests descriptions.

When an ioctl that takes an output or read/write parameter fails, the parameter remains unmodified.

**ioctl MEDIA_IOCDEVICE_INFO**

Name

MEDIA_IOCDEVICE_INFO - Query device information

Synopsis

```c
int ioctl(int fd, MEDIA_IOCDEVICE_INFO, struct media_device_info *argp)
```
Arguments

**fd** File descriptor returned by `open()`.

argp

Description

All media devices must support the MEDIA_IOC_DEVICE_INFO ioctl. To query device information, applications call the ioctl with a pointer to a struct `media_device_info`. The driver fills the structure and returns the information to the application. The ioctl never fails.

<table>
<thead>
<tr>
<th>Table 1.195: struct media_device_info</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>char</strong> driver[16]</td>
</tr>
<tr>
<td><strong>char</strong> model[32]</td>
</tr>
<tr>
<td><strong>char</strong> serial[40]</td>
</tr>
<tr>
<td><strong>char</strong> bus_info[32]</td>
</tr>
<tr>
<td><strong>__u32</strong> media_version</td>
</tr>
<tr>
<td><strong>__u32</strong> hw_revision</td>
</tr>
<tr>
<td><strong>__u32</strong> driver_version</td>
</tr>
<tr>
<td><strong>__u32</strong> reserved[31]</td>
</tr>
</tbody>
</table>

The serial and bus_info fields can be used to distinguish between multiple instances of otherwise identical hardware. The serial number takes precedence when provided and can be assumed to be unique. If the serial number is an empty string, the bus_info field can be used instead. The bus_info field is guaranteed to be unique, but can vary across reboots or device unplug/replug.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the *Generic Error Codes* chapter.

**ioctl MEDIA_IOC_G_TOPOLOGY**

Name

MEDIA_IOC_G_TOPOLOGY - Enumerate the graph topology and graph element properties
Synopsis

```c
int ioctl(int fd, MEDIA_IOC_G_TOPOLOGY, struct media_v2_topology *argp)
```

Arguments

- `fd`: File descriptor returned by `open()`.
- `argp`: Pointer to the structure.

Description

The typical usage of this ioctl is to call it twice. On the first call, the structure defined at `struct media_v2_topology` should be zeroed. At return, if no errors happen, this ioctl will return the `topology_version` and the total number of entities, interfaces, pads and links.

Before the second call, the userspace should allocate arrays to store the graph elements that are desired, putting the pointers to them at `ptr_entities`, `ptr_interfaces`, `ptr_links` and/or `ptr_pads`, keeping the other values untouched.

If the `topology_version` remains the same, the ioctl should fill the desired arrays with the media graph elements.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>

Table 1.201: struct media_v2_pad

| __u32 | id                | Unique ID for the pad. |
| __u32 | source_id         | On pad to pad links: unique ID for the source pad. On interface to entity links: unique ID for the interface. |
| __u32 | sink_id           | On pad to pad links: unique ID for the sink pad. On interface to entity links: unique ID for the entity. |
| __u32 | flags             | Link flags, see Media link flags for more details. |
| __u32 | reserved[5]       | Reserved for future extensions. Drivers and applications must set this array to zero. |

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ENOSPC This is returned when either one or more of the num_entities, num_interfaces, num_links or num_pads are non-zero and are smaller than the actual number of elements inside the graph. This may happen if the topology_version changed when compared to the last time this ioctl was called. Userspace should usually free the area for the pointers, zero the struct elements and call this ioctl again.

ioctl MEDIA_IOC_ENUM_ENTITIES

Name

MEDIA_IOC_ENUM_ENTITIES - Enumerate entities and their properties

Synopsis

int ioctl(int fd, MEDIA_IOC_ENUM_ENTITIES, struct media_entity_desc *argp)
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| fd       | File descriptor returned by `open()`.
| argp     | Arguments to `ioctl()` |

Description

To query the attributes of an entity, applications set the id field of an `struct media_entity_desc` structure and call the `MEDIA_IOC_ENUM_ENTITIES` ioctl with a pointer to this structure. The driver fills the rest of the structure or returns an EINVAL error code when the id is invalid. Entities can be enumerated by or’ing the id with the `MEDIA_ENT_ID_FLAG_NEXT` flag. The driver will return information about the entity with the smallest id strictly larger than the requested one (‘next entity’), or the EINVAL error code if there is none.

Entity IDs can be non-contiguous. Applications must not try to enumerate entities by calling `MEDIA_IOC_ENUM_ENTITIES` with increasing id’s until they get an error.

Table 1.202: struct media_entity_desc

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u32 id</td>
<td>Entity id, set by the application. When the id is or’ed with <code>MEDIA_ENT_ID_FLAG_NEXT</code>, the driver clears the flag and returns the first entity with a larger id.</td>
</tr>
<tr>
<td>char name[32]</td>
<td>Entity name as an UTF-8 NULL-terminated string.</td>
</tr>
<tr>
<td>__u32 type</td>
<td>Entity type, see <code>Media entity types</code> for details.</td>
</tr>
<tr>
<td>__u32 revision</td>
<td>Entity revision. Always zero (obsolete)</td>
</tr>
<tr>
<td>__u32 flags</td>
<td>Entity flags, see <code>Media entity flags</code> for details.</td>
</tr>
<tr>
<td>__u32 group_id</td>
<td>Entity group ID. Always zero (obsolete)</td>
</tr>
<tr>
<td>__u16 pads</td>
<td>Number of pads</td>
</tr>
<tr>
<td>__u16 links</td>
<td>Total number of outbound links. Inbound links are not counted in this field.</td>
</tr>
</tbody>
</table>

union

Valid for (sub-)devices that create a single device node.

__u32 major | Device node major number. |
__u32 minor | Device node minor number. |
__u8 raw[184] |

Return Value

On success 0 is returned, on error -1 and the `errno` variable is set appropriately. The generic error codes are described at the `Generic Error Codes` chapter.

EINVAL The struct `media_entity_desc` id references a non-existing entity.

ioctl `MEDIA_IOC_ENUM_LINKS`

Name

`MEDIA_IOC_ENUM_LINKS` - Enumerate all pads and links for a given entity

Synopsis

```c
int ioctl(int fd, MEDIA_IOC_ENUM_LINKS, struct media_links_enum *argp)
```
Arguments

fd  File descriptor returned by  open().
argp

Description

To enumerate pads and/or links for a given entity, applications set the entity field of a struct  media_links_enum  structure and initialize the struct  media_pad_desc  and struct  media_link_desc  structure arrays pointed by the pads and links fields. They then call the MEDIA_IOC_ENUM_LINKS ioctl with a pointer to this structure.

If the pads field is not NULL, the driver fills the pads array with information about the entity’s pads. The array must have enough room to store all the entity’s pads. The number of pads can be retrieved with  ioctl MEDIA_IOC_ENUM_ENTITIES .

If the links field is not NULL, the driver fills the links array with information about the entity’s outbound links. The array must have enough room to store all the entity’s outbound links. The number of outbound links can be retrieved with  ioctl MEDIA_IOC_ENUM_ENTITIES .

Only forward links that originate at one of the entity’s source pads are returned during the enumeration process.

Table 1.203: struct media_links_enum

<table>
<thead>
<tr>
<th>__u32</th>
<th>entity</th>
<th>Entity id, set by the application.</th>
</tr>
</thead>
<tbody>
<tr>
<td>struct media_pad_desc *pads</td>
<td>Pointer to a pads array allocated by the application. Ignored if NULL.</td>
<td></td>
</tr>
<tr>
<td>struct media_link_desc *links</td>
<td>Pointer to a links array allocated by the application. Ignored if NULL.</td>
<td></td>
</tr>
</tbody>
</table>

Table 1.204: struct media_pad_desc

<table>
<thead>

<th>ID of the entity this pad belongs to.</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u16</td>
<td>index</td>
<td>0-based pad index.</td>
</tr>
<tr>
<td>__u32</td>
<td>flags</td>
<td>Pad flags, see  Media pad flags  for more details.</td>
</tr>
</tbody>
</table>

Table 1.205: struct media_link_desc

<table>
<thead>
<tr>
<th>struct media_pad_desc source</th>
<th>Pad at the origin of this link.</th>
</tr>
</thead>
<tbody>
<tr>
<td>struct media_pad_desc sink</td>
<td>Pad at the target of this link.</td>
</tr>
<tr>
<td>__u32 flags</td>
<td>Link flags, see  Media link flags  for more details.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the  errno  variable is set appropriately. The generic error codes are described at the  Generic Error Codes  chapter.

EINVAL  The struct  media_links_enum  id references a non-existing entity.

ioctl MEDIA_IOC_SETUP_LINK

Name

MEDIA_IOC_SETUP_LINK - Modify the properties of a link
Synopsis

int ioctl(int fd, MEDIA_IOC_SETUP_LINK, struct media_link_desc *argp)

Arguments

fd File descriptor returned by open().
argp

Description

To change link properties applications fill a struct media_link_desc with link identification information (source and sink pad) and the new requested link flags. They then call the MEDIA_IOC_SETUP_LINK ioctl with a pointer to that structure.

The only configurable property is the ENABLED link flag to enable/disable a link. Links marked with the IMMUTABLE link flag can not be enabled or disabled.

Link configuration has no side effect on other links. If an enabled link at the sink pad prevents the link from being enabled, the driver returns with an EBUSY error code.

Only links marked with the DYNAMIC link flag can be enabled/disabled while streaming media data. Attempting to enable or disable a streaming non-dynamic link will return an EBUSY error code.

If the specified link can’t be found the driver returns with an EINVAL error code.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

EINVAL The struct media_link_desc references a non-existing link, or the link is immutable and an attempt to modify its configuration was made.

1.6 Part V - Consumer Electronics Control API

This part describes the CEC: Consumer Electronics Control

Table of Contents

1.6.1 Introduction

Note:
This documents the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.

HDMI connectors provide a single pin for use by the Consumer Electronics Control protocol. This protocol allows different devices connected by an HDMI cable to communicate. The protocol for CEC version 1.4 is defined in supplements 1 (CEC) and 2 (HEAC or HDMI Ethernet and Audio Return Channel) of the HDMI 1.4a (HDMI) specification and the extensions added to CEC version 2.0 are defined in chapter 11 of the HDMI 2.0 (HDMI2) specification.

The bitrate is very slow (effectively no more than 36 bytes per second) and is based on the ancient AV.link protocol used in old SCART connectors. The protocol closely resembles a crazy Rube Goldberg contraption and is an unholy mix of low and high level messages. Some messages, especially those part of the HEAC protocol layered on top of CEC, need to be handled by the kernel, others can be handled either by the kernel or by userspace.

In addition, CEC can be implemented in HDMI receivers, transmitters and in USB devices that have an HDMI input and an HDMI output and that control just the CEC pin.

Drivers that support CEC will create a CEC device node (/dev/cecX) to give userspace access to the CEC adapter. The `ioctl CEC_ADAP_G_CAPS` ioctl will tell userspace what it is allowed to do.

1.6.2 Function Reference

`cec open()`

Name

`cec-open` - Open a cec device

Synopsis

```c
#include <fcntl.h>

int open(const char *device_name, int flags)
```
Arguments

**device_name** Device to be opened.

**flags** Open flags. Access mode must be O_RDWR.

When the O_NONBLOCK flag is given, the `CEC_RECEIVE` and `CEC_DOEVENT()` ioctls will return the EAGAIN error code when no message or event is available, and ioctls `CEC_TRANSMIT`, `CEC_ADAP_S_PHYS_ADDR` and `CEC_ADAP_S_LOG_ADDRS` all return 0.

Other flags have no effect.

Description

**Note:**

This documents the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.

To open a cec device applications call `open()` with the desired device name. The function has no side effects; the device configuration remain unchanged.

When the device is opened in read-only mode, attempts to modify its configuration will result in an error, and `errno` will be set to EBADF.

Return Value

`open()` returns the new file descriptor on success. On error, -1 is returned, and `errno` is set appropriately. Possible error codes include:

- **EACCES** The requested access to the file is not allowed.
- **EMFILE** The process already has the maximum number of files open.
- **ENFILE** The system limit on the total number of open files has been reached.
- **ENOMEM** Insufficient kernel memory was available.
- **ENXIO** No device corresponding to this device special file exists.

**cec close()**

Name

`cec-close` - Close a cec device

Synopsis

```c
#include <unistd.h>

int close(int fd)
```

Arguments

**fd** File descriptor returned by `open()`.
Description

**Note:**

*This documents the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.*

Closes the cec device. Resources associated with the file descriptor are freed. The device configuration remain unchanged.

**Return Value**

`close()` returns 0 on success. On error, -1 is returned, and `errno` is set appropriately. Possible error codes are:

- **EBADF**  fd is not a valid open file descriptor.

**cec ioctl()**

**Name**

tiec-ioctl - Control a cec device

**Synopsis**

```c
#include <sys/ioctl.h>

int ioctl(int fd, int request, void *argp)
```

**Arguments**

- **fd**  File descriptor returned by `open()`.
- **request**  CEC ioctl request code as defined in the cec.h header file, for example `CEC_ADAP_G_CAPS()`.
- **argp**  Pointer to a request-specific structure.

**Description**

**Note:**

*This documents the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.*

The `ioctl()` function manipulates cec device parameters. The argument `fd` must be an open file descriptor.

The ioctl request code specifies the cec function to be called. It has encoded in it whether the argument is an input, output or read/write parameter, and the size of the argument argp in bytes.
Macros and structures definitions specifying cec ioctl requests and their parameters are located in the cec.h header file. All cec ioctl requests, their respective function and parameters are specified in Function Reference.

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter. Request-specific error codes are listed in the individual requests descriptions.

When an ioctl that takes an output or read/write parameter fails, the parameter remains unmodified.

**cec poll()**

**Name**

cec-poll - Wait for some event on a file descriptor

**Synopsis**

```c
#include <sys/poll.h>

int poll(struct pollfd *ufds, unsigned int nfds, int timeout)
```

**Arguments**

- **ufds** List of FD events to be watched
- **nfds** Number of FD events at the *ufds array
- **timeout** Timeout to wait for events

**Description**

**Note:**

This document the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.

With the poll() function applications can wait for CEC events.

On success poll() returns the number of file descriptors that have been selected (that is, file descriptors for which the revents field of the respective struct pollfd structure is non-zero). CEC devices set the POLLIN and POLLRDNORM flags in the revents field if there are messages in the receive queue. If the transmit queue has room for new messages, the POLLOUT and POLLWRNORM flags are set. If there are events in the event queue, then the POLLPRI flag is set. When the function timed out it returns a value of zero, on failure it returns -1 and the errno variable is set appropriately.

For more details see the poll() manual page.
Return Value

On success, `poll()` returns the number structures which have non-zero revents fields, or zero if the call timed out. On error -1 is returned, and the `errno` variable is set appropriately:

- **EBADF**: One or more of the ufds members specify an invalid file descriptor.
- **EFAULT**: ufds references an inaccessible memory area.
- **EINVAL**: The call was interrupted by a signal.
- **EINVAL**: The nfds argument is greater than `OPEN_MAX`.

**ioctl CEC_ADAP_G_CAPS**

### Name

CEC_ADAP_G_CAPS - Query device capabilities

### Synopsis

```c
int ioctl(int fd, CEC_ADAP_G_CAPS, struct cec_caps *argp)
```

### Arguments

- **fd**: File descriptor returned by `open()`.
- **argp**:

### Description

**Note:**

This documents the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.

All cec devices must support `ioctl CEC_ADAP_G_CAPS`. To query device information, applications call the `ioctl` with a pointer to a struct `cec_caps`. The driver fills the structure and returns the information to the application. The `ioctl` never fails.

ioctls CEC_ADAP_G_LOG_ADDRS and CEC_ADAP_S_LOG_ADDRS

Name

CEC_ADAP_G_LOG_ADDRS, CEC_ADAP_S_LOG_ADDRS - Get or set the logical addresses

Synopsis

```c
int ioctl(int fd, CEC_ADAP_G_LOG_ADDRS, struct cec_log_addrs *argp)
int ioctl(int fd, CEC_ADAP_S_LOG_ADDRS, struct cec_log_addrs *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to struct cec_log_addrs
Description

Note:

This document the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.

To query the current CEC logical addresses, applications call `ioctl CEC_ADAP_G_LOG_ADDRS` with a pointer to a struct `cec_log_addrs` where the driver stores the logical addresses.

To set new logical addresses, applications fill in `struct cec_log_addrs` and call `ioctl CEC_ADAP_S_LOG_ADDRS` with a pointer to this struct. The `ioctl CEC_ADAP_S_LOG_ADDRS` is only available if CEC_CAP_LOG_ADDRS is set (the ENOTTY error code is returned otherwise). The `ioctl CEC_ADAP_S_LOG_ADDRS` can only be called by a file descriptor in initiator mode (see `ioctl CEC_G_MODE` and `CEC_S_MODE`), if not the EBUSY error code will be returned.

To clear existing logical addresses set `num_log_addrs` to 0. All other fields will be ignored in that case. The adapter will go to the unconfigured state.

If the physical address is valid (see `ioctl CEC_ADAP_S_PHYS_ADDR`), then this ioctl will block until all requested logical addresses have been claimed. If the file descriptor is in non-blocking mode then it will not wait for the logical addresses to be claimed, instead it just returns 0.

A `CEC_EVENT_STATE_CHANGE` event is sent when the logical addresses are claimed or cleared.

Attempting to call `ioctl CEC_ADAP_S_LOG_ADDRS` when logical address types are already defined will return with error EBUSY.

Table 1.208: struct cec_log_addrs

<table>

ioctls CEC_ADAP_G_PHYS_ADDR and CEC_ADAP_S_PHYS_ADDR

Name

CEC_ADAP_G_PHYS_ADDR, CEC_ADAP_S_PHYS_ADDR - Get or set the physical address

Synopsis

```c
int ioctl(int fd, CEC_ADAP_G_PHYS_ADDR, __u16 *argp)
int ioctl(int fd, CEC_ADAP_S_PHYS_ADDR, __u16 *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp** Pointer to the CEC address.

Description

This documents the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.

To query the current physical address applications call `ioctl CEC_ADAP_G_PHYS_ADDR` with a pointer to a __u16 where the driver stores the physical address.

To set a new physical address applications store the physical address in a __u16 and call `ioctl CEC_ADAP_S_PHYS_ADDR` with a pointer to this integer. The `ioctl CEC_ADAP_S_PHYS_ADDR` is only available if CEC_CAP_PHYS_ADDR is set (the ENOTTY error code will be returned otherwise). The `ioctl CEC_ADAP_S_PHYS_ADDR` can only be called by a file descriptor in initiator mode (see `ioctls CEC_G_MODE` and `CEC_S_MODE`), if not the EBUSY error code will be returned.

To clear an existing physical address use `CEC_PHYS_ADDR_INVALID`. The adapter will go to the unconfigured state.

If logical address types have been defined (see `ioctl CEC_ADAP_S_LOG_ADDRS`), then this ioctl will block until all requested logical addresses have been claimed. If the file descriptor is in non-blocking mode then it will not wait for the logical addresses to be claimed, instead it just returns 0.

A CEC_EVENT_STATE_CHANGE event is sent when the physical address changes.

The physical address is a 16-bit number where each group of 4 bits represent a digit of the physical address a.b.c.d where the most significant 4 bits represent ‘a’. The CEC root device (usually the TV) has address 0.0.0.0. Every device that is hooked up to an input of the TV has address a.0.0.0 (where ‘a’ is ≥ 1), devices hooked up to those in turn have addresses a.b.0.0, etc. So a topology of up to 5 devices deep is supported. The physical address a device shall use is stored in the EDID of the sink.

For example, the EDID for each HDMI input of the TV will have a different physical address of the form a.0.0.0 that the sources will read out and use as their physical address.
Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctl CEC_DQEVENT

Name

CEC_DQEVENT - Dequeue a CEC event

Synopsis

```c
int ioctl(int fd, CEC_DQEVENT, struct cec_event *argp)
```

Arguments

- **fd** File descriptor returned by `open()`.
- **argp**

Description

---

**Note:**

This document the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.

---

CEC devices can send asynchronous events. These can be retrieved by calling `CEC_DQEVENT()`. If the file descriptor is in non-blocking mode and no event is pending, then it will return -1 and set errno to the EAGAIN error code.

The internal event queues are per-filehandle and per-event type. If there is no more room in a queue then the last event is overwritten with the new one. This means that intermediate results can be thrown away but that the latest event is always available. This also means that it is possible to read two successive events that have the same value (e.g. two `CEC_EVENT_STATE_CHANGE` events with the same state). In that case the intermediate state changes were lost but it is guaranteed that the state did change in between the two events.

<table>
<thead>
<tr>
<th>Table 1.213: struct cec_event_state_change</th>
<th>Table 1.214: struct cec_event_lost_msgs</th>
</tr>
</thead>
<tbody>
<tr>
<td>_u16 phys_addr</td>
<td>The current physical address.</td>
</tr>
<tr>
<td>_u16 log_addr_mask</td>
<td>The current set of claimed logical addresses.</td>
</tr>
</tbody>
</table>
Table 1.215: struct cec_event

| __u64  | ts    | Timestamp of the event in ns. The timestamp has been taken from the CLOCK_MONOTONIC clock. To access the same clock from userspace use clock_gettime(2). |
| __u32  | event | The CEC event type, see CEC Events Types. |
| __u32  | flags | Event flags, see CEC Event Flags. |

union (anonymous)

| struct cec_event_state_change | state_change | The new adapter state as sent by the CEC_EVENT_STATE_CHANGE event. |
| struct cec_event_lost_msgs    | lost_msgs    | The number of lost messages as sent by the CEC_EVENT_LOST_MSGS event. |

Table 1.216: CEC Events Types

| CEC_EVENT_STATE_CHANGE     | 1 | Generated when the CEC Adapter’s state changes. When open() is called an initial event will be generated for that file-handle with the CEC Adapter’s state at that time. |
| CEC_EVENT_LOST_MSGS        | 2 | Generated if one or more CEC messages were lost because the application didn’t dequeue CEC messages fast enough. |

Table 1.217: CEC Event Flags

| CEC_EVENT_FL_INITIAL_VALUE | 1 | Set for the initial events that are generated when the device is opened. See the table above for which events do this. This allows applications to learn the initial state of the CEC adapter at open() time. |

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

ioctls CEC_G_MODE and CEC_S_MODE

CEC_G_MODE, CEC_S_MODE - Get or set exclusive use of the CEC adapter

Synopsis

int ioctl(int fd, CEC_G_MODE, __u32 *argp)
int ioctl(int fd, CEC_S_MODE, __u32 *argp)

Arguments

fd File descriptor returned by open().
argp Pointer to CEC mode.
**Description**

**Note:**

This documents the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.

By default any filehandle can use `ioctl CEC_RECEIVE` and `CECTRANSMIT`, but in order to prevent applications from stepping on each other's toes it must be possible to obtain exclusive access to the CEC adapter. This ioctl sets the filehandle to initiator and/or follower mode which can be exclusive depending on the chosen mode. The initiator is the filehandle that is used to initiate messages, i.e., it commands other CEC devices. The follower is the filehandle that receives messages sent to the CEC adapter and processes them. The same filehandle can be both initiator and follower, or this role can be taken by two different filehandles.

When a CEC message is received, then the CEC framework will decide how it will be processed. If the message is a reply to an earlier transmitted message, then the reply is sent back to the filehandle that is waiting for it. In addition the CEC framework will process it.

If the message is not a reply, then the CEC framework will process it first. If there is no follower, then the message is just discarded and a feature abort is sent back to the initiator if the framework couldn’t process it. If there is a follower, then the message is passed on to the follower who will use `ioctl CEC_RECEIVE` to dequeue the new message. The framework expects the follower to make the right decisions.

The CEC framework will process core messages unless requested otherwise by the follower. The follower can enable the passthrough mode. In that case, the CEC framework will pass on most core messages without processing them and the follower will have to implement those messages. There are some messages that the core will always process, regardless of the passthrough mode. See [Core Message Processing](#) for details.

If there is no initiator, then any CEC filehandle can use `ioctl CEC_TRANSMIT`. If there is an exclusive initiator then only that initiator can call `ioctl CEC_RECEIVE` and `CECTRANSMIT`. The follower can of course always call `ioctl CEC_TRANSMIT`.

Available initiator modes are:

<table>
<thead>
<tr>
<th><strong>Table 1.218: Initiator Modes</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CEC_MODE_NO_INITIATOR</strong></td>
</tr>
<tr>
<td><strong>CEC_MODE_INITIATOR</strong></td>
</tr>
<tr>
<td><strong>CEC_MODE_EXCL_INITIATOR</strong></td>
</tr>
</tbody>
</table>

Available follower modes are:
### Table 1.219: Follower Modes

<table>
<thead>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CEC_MODE_NO_FOLLOWER</td>
<td>0x00</td>
<td>This is not a follower (the default when the device is opened).</td>
</tr>
<tr>
<td>CEC_MODE_FOLLOWER</td>
<td>0x10</td>
<td>This is a follower and it will receive CEC messages unless there is an exclusive follower. You cannot become a follower if \textit{CEC_CAP_TRANSMIT} is not set or if \textit{CEC_MODE_NO_INITIATOR} was specified, the EINVAL error code is returned in that case.</td>
</tr>
<tr>
<td>CEC_MODE_EXCL_FOLLOWER</td>
<td>0x20</td>
<td>This is an exclusive follower and only this file descriptor will receive CEC messages for processing. If someone else is already the exclusive follower then an attempt to become one will return the EBUSY error code. You cannot become a follower if \textit{CEC_CAP_TRANSMIT} is not set or if \textit{CEC_MODE_NO_INITIATOR} was specified, the EINVAL error code is returned in that case.</td>
</tr>
<tr>
<td>CEC_MODE_EXCL_FOLLOWER_PASSTHRU</td>
<td>0x30</td>
<td>This is an exclusive follower and only this file descriptor will receive CEC messages for processing. In addition it will put the CEC device into passthrough mode, allowing the exclusive follower to handle most core messages instead of relying on the CEC framework for that. If someone else is already the exclusive follower then an attempt to become one will return the EBUSY error code. You cannot become a follower if \textit{CEC_CAP_TRANSMIT} is not set or if \textit{CEC_MODE_NO_INITIATOR} was specified, the EINVAL error code is returned in that case.</td>
</tr>
<tr>
<td>CEC_MODE_MONITOR</td>
<td>0xe0</td>
<td>Put the file descriptor into monitor mode. Can only be used in combination with \textit{CEC_MODE_NO_INITIATOR}, otherwise EINVAL error code will be returned. In monitor mode all messages this CEC device transmits and all messages it receives (both broadcast messages and directed messages for one its logical addresses) will be reported. This is very useful for debugging. This is only allowed if the process has the \textit{CAP_NET_ADMIN} capability. If that is not set, then the EPERM error code is returned.</td>
</tr>
<tr>
<td>CEC_MODE_MONITOR_ALL</td>
<td>0xf0</td>
<td>Put the file descriptor into ‘monitor all’ mode. Can only be used in combination with \textit{CEC_MODE_NO_INITIATOR}, otherwise the EINVAL error code will be returned. In ‘monitor all’ mode all messages this CEC device transmits and all messages it receives, including directed messages for other CEC devices will be reported. This is very useful for debugging, but not all devices support this. This mode requires that the \textit{CEC_CAP_MONITOR_ALL} capability is set, otherwise the EINVAL error code is returned. This is only allowed if the process has the \textit{CAP_NET_ADMIN} capability. If that is not set, then the EPERM error code is returned.</td>
</tr>
</tbody>

Table 1.220: Core Message Processing

<table>
<thead>
<tr>
<th>Message Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| CEC_MSG_GET_CEC_VERSION           | When in passthrough mode this message has to be handled by userspace, otherwise the core will return the CEC version that was set with `ioctl CEC_ADAP_S_LOG_ADDRS`.
| CEC_MSG_GIVE_DEVICE_VENDOR_ID     | When in passthrough mode this message has to be handled by userspace, otherwise the core will return the vendor ID that was set with `ioctl CEC_ADAP_S_LOG_ADDRS`.
| CEC_MSG_ABORT                     | When in passthrough mode this message has to be handled by userspace, otherwise the core will return a feature refused message as per the specification.
| CEC_MSG_GIVE_PHYSICAL_ADDR        | When in passthrough mode this message has to be handled by userspace, otherwise the core will report the current physical address.
| CEC_MSG_GIVE_OSD_NAME             | When in passthrough mode this message has to be handled by userspace, otherwise the core will report the current OSD name as was set with `ioctl CEC_ADAP_S_LOG_ADDRS`.
| CEC_MSG_GIVE_FEATURES             | When in passthrough mode this message has to be handled by userspace, otherwise the core will report the current features as was set with `ioctl CEC_ADAP_S_LOG_ADDRS` or the message is ignored if the CEC version was older than 2.0.
| CEC_MSG_USER_CONTROL_PRESSED      | If `CEC_CAP_RC` is set, then generate a remote control key press. This message is always passed on to userspace. |
| CEC_MSG_USER_CONTROL_RELEASED     | If `CEC_CAP_RC` is set, then generate a remote control key release. This message is always passed on to userspace. |
| CEC_MSG_REPORT_PHYSICAL_ADDR      | The CEC framework will make note of the reported physical address and then just pass the message on to userspace. |

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the [Generic Error Codes](#) chapter.

`ioctl CEC_RECEIVE and CEC_TRANSMIT`

**Name**

CEC_RECEIVE, CEC_TRANSMIT - Receive or transmit a CEC message

**Synopsis**

```c
int ioctl(int fd, CEC_RECEIVE, struct cec_msg *argp)
int ioctl(int fd, CEC_TRANSMIT, struct cec_msg *argp)
```

**Arguments**

`fd` File descriptor returned by `open()`.
argp Pointer to struct cec_msg.

Description

**Note:**

This documents the proposed CEC API. This API is not yet finalized and is currently only available as a staging kernel module.

To receive a CEC message the application has to fill in the timeout field of struct cec_msg and pass it to *ioctl CEC_RECEIVE*. If the file descriptor is in non-blocking mode and there are no received messages pending, then it will return -1 and set errno to the EAGAIN error code. If the file descriptor is in blocking mode and timeout is non-zero and no message arrived within timeout milliseconds, then it will return -1 and set errno to the ETIMEDOUT error code.

A received message can be:

1. a message received from another CEC device (the sequence field will be 0).
2. the result of an earlier non-blocking transmit (the sequence field will be non-zero).

To send a CEC message the application has to fill in the struct cec_msg and pass it to *ioctl CEC_TRANSMIT*. The *ioctl CEC_TRANSMIT* is only available if CEC_CAP_TRANSMIT is set. If there is no more room in the transmit queue, then it will return -1 and set errno to the EBUSY error code. The transmit queue has enough room for 18 messages (about 1 second worth of 2-byte messages). Note that the CEC kernel framework will also reply to core messages (see :ref:cec-core-processing), so it is not a good idea to fully fill up the transmit queue.

If the file descriptor is in non-blocking mode then the transmit will return 0 and the result of the transmit will be available via *ioctl CEC_RECEIVE* once the transmit has finished (including waiting for a reply, if requested).

The sequence field is filled in for every transmit and this can be checked against the received messages to find the corresponding transmit result.

### Table 1.221: struct cec_msg

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>__u64 tx_ts</td>
<td>Timestamp in ns of when the last byte of the message was transmitted. The timestamp has been taken from the CLOCK_MONOTONIC clock. To access the same clock from userspace use \texttt{clock_gettime(2)}().</td>
</tr>
<tr>
<td>__u64 rx_ts</td>
<td>Timestamp in ns of when the last byte of the message was received. The timestamp has been taken from the CLOCK_MONOTONIC clock. To access the same clock from userspace use \texttt{clock_gettime(2)}().</td>
</tr>
<tr>
<td>__u32 len</td>
<td>The length of the message. For <em>ioctl CEC_TRANSMIT</em> this is filled in by the application. The driver will fill this in for <em>ioctl CEC_RECEIVE</em>. For <em>ioctl CEC_TRANSMIT</em> it will be filled in by the driver with the length of the reply message if reply was set.</td>
</tr>
<tr>
<td>__u32 timeout</td>
<td>The timeout in milliseconds. This is the time the device will wait for a message to be received before timing out. If it is set to 0, then it will wait indefinitely when it is called by <em>ioctl CEC_RECEIVE</em>. If it is 0 and it is called by <em>ioctl CEC_TRANSMIT</em>, then it will be replaced by 1000 if the reply is non-zero or ignored if reply is 0.</td>
</tr>
<tr>
<td>__u32 sequence</td>
<td>A non-zero sequence number is automatically assigned by the CEC framework for all transmitted messages. It is used by the CEC framework when it queues the transmit result (when transmit was called in non-blocking mode). This allows the application to associate the received message with the original transmit.</td>
</tr>
<tr>
<td>__u32</td>
<td>flags</td>
</tr>
<tr>
<td>__u8</td>
<td>tx_status</td>
</tr>

</table>
Table 1.222: CEC Transmit Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CEC_TX_STATUS_OK</td>
<td>0x01</td>
<td>The message was transmitted successfully. This is mutually exclusive with CEC_TX_STATUS_MAX_RETRIES. Other bits can still be set if earlier attempts met with failure before the transmit was eventually successful.</td>
</tr>
<tr>
<td>CEC_TX_STATUS_ARB_LOST</td>
<td>0x02</td>
<td>CEC line arbitration was lost.</td>
</tr>
<tr>
<td>CEC_TX_STATUS_NACK</td>
<td>0x04</td>
<td>Message was not acknowledged.</td>
</tr>
<tr>
<td>CEC_TX_STATUS_LOW_DRIVE</td>
<td>0x08</td>
<td>Low drive was detected on the CEC bus. This indicates that a follower detected an error on the bus and requests a retransmission.</td>
</tr>
<tr>
<td>CEC_TX_STATUS_ERROR</td>
<td>0x10</td>
<td>Some error occurred. This is used for any errors that do not fit the previous two, either because the hardware could not tell which error occurred, or because the hardware tested for other conditions besides those two.</td>
</tr>
<tr>
<td>CEC_TX_STATUS_MAX_RETRIES</td>
<td>0x20</td>
<td>The transmit failed after one or more retries. This status bit is mutually exclusive with CEC_TX_STATUS_OK. Other bits can still be set to explain which failures were seen.</td>
</tr>
</tbody>
</table>

Table 1.223: CEC Receive Status

<table>
<thead>
<tr>
<th>Status Code</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CEC_RX_STATUS_OK</td>
<td>0x01</td>
<td>The message was received successfully.</td>
</tr>
<tr>
<td>CEC_RX_STATUS_TIMEOUT</td>
<td>0x02</td>
<td>The reply to an earlier transmitted message timed out.</td>
</tr>
<tr>
<td>CEC_RX_STATUS_FEATURE_ABORT</td>
<td>0x04</td>
<td>The message was received successfully but the reply was CEC_MSG_FEATURE_ABORT. This status is only set if this message was the reply to an earlier transmitted message.</td>
</tr>
</tbody>
</table>

Return Value

On success 0 is returned, on error -1 and the errno variable is set appropriately. The generic error codes are described at the Generic Error Codes chapter.

*/
#ifndef _CEC_UAPI_H
#define _CEC_UAPI_H
#include <linux/types.h>
#define CEC_MAX_MSG_SIZE 16

/**
 * struct cec_msg - CEC message structure.
 * @tx_ts: Timestamp in nanoseconds using CLOCK_MONOTONIC. Set by the
 * driver when the message transmission has finished.
 * @rx_ts: Timestamp in nanoseconds using CLOCK_MONOTONIC. Set by the
 * driver when the message was received.
 * @len: Length in bytes of the message.
 * @timeout: The timeout (in ms) that is used to timeout CEC_RECEIVE.
 * Set to 0 if you want to wait forever. This timeout can also be
 * used with CEC_TRANSMIT as the timeout for waiting for a reply.
 * If 0, then it will use a 1 second timeout instead of waiting
 * forever as is done with CEC_RECEIVE.
 * @sequence: The framework assigns a sequence number to messages that are
 * sent. This can be used to track replies to previously sent
 * messages.
 * @flags: Set to 0.
 * @msg: The message payload.
 * @reply: This field is ignored with CEC_RECEIVE and is only used by
 * CEC_TRANSMIT. If non-zero, then wait for a reply with this
 * opcode. Set to CEC MSG_FEATURE_ABORT if you want to wait for
 * a possible ABORT reply. If there was an error when sending the
 * msg or FeatureAbort was returned, then reply is set to 0.
 * If reply is non-zero upon return, then len/msg are set to
* the received message.
* If reply is zero upon return and status has the
  * CEC_TX_STATUS_FEATURE_ABORT bit set, then len/msg are set to
  * the received feature abort message.
* If reply is zero upon return and status has the
  * CEC_TX_STATUS_MAX_RETRIES bit set, then no reply was seen at
  * all. If reply is non-zero for CEC_TRANSMIT and the message is a
  * broadcast, then -EINVAL is returned.
* if reply is non-zero, then timeout is set to 1000 (the required
  * maximum response time).
* @rx_status: The message receive status bits. Set by the driver.
* @tx_status: The message transmit status bits. Set by the driver.
* @tx_arb_lost_cnt: The number of 'Arbitration Lost' events. Set by the driver.
* @tx_nack_cnt: The number of 'Not Acknowledged' events. Set by the driver.
* @tx_low_drive_cnt: The number of 'Low Drive Detected' events. Set by the
  * driver.
* @tx_error_cnt: The number of 'Error' events. Set by the driver.

revision 1.0.0 / 2016-03-17 (hv)
Initial revision

1.7 Generic Error Codes

Table 1.224: Generic error codes

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EAGAIN</td>
<td>The ioctl can't be handled because the device is in state where it can't perform it. This could happen for example in case where device is sleeping and ioctl is performed to query statistics. It is also returned when the ioctl would need to wait for an event, but the device was opened in non-blocking mode.</td>
</tr>
<tr>
<td>EBADF</td>
<td>The file descriptor is not a valid.</td>
</tr>
<tr>
<td>EBUSY</td>
<td>The ioctl can't be handled because the device is busy. This is typically return while device is streaming, and an ioctl tried to change something that would affect the stream, or would require the usage of a hardware resource that was already allocated. The ioctl must not be retried without performing another action to fix the problem first (typically: stop the stream before retrying).</td>
</tr>
<tr>
<td>EFAULT</td>
<td>There was a failure while copying data from/to userspace, probably caused by an invalid pointer reference.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>One or more of the ioctl parameters are invalid or out of the allowed range. See the individual ioctl requests for specific causes.</td>
</tr>
<tr>
<td>ENODEV</td>
<td>Device not found or was removed.</td>
</tr>
<tr>
<td>ENOMEM</td>
<td>There's not enough memory to handle the desired operation.</td>
</tr>
<tr>
<td>ENOTTY</td>
<td>The ioctl is not supported by the driver, actually meaning that the required functionality is not available, or the file descriptor is not for a media device.</td>
</tr>
<tr>
<td>ENOSPC</td>
<td>On USB devices, the stream ioctl's can return this error, meaning that this request would overcommit the usb bandwidth reserved for periodic transfers (up to 80% of the USB bandwidth).</td>
</tr>
<tr>
<td>EPERM</td>
<td>Permission denied. Can be returned if the device needs write permission, or some special capabilities is needed (e. g. root)</td>
</tr>
</tbody>
</table>

Note:

1. This list is not exhaustive; ioctl's may return other error codes. Since errors may have side effects such as a driver reset, applications should abort on unexpected errors, or otherwise assume that the device is in a bad state.
2. Request-specific error codes are listed in the individual requests descriptions.

1.8 GNU Free Documentation License

1.8.1 0. PREAMBLE

The purpose of this License is to make a manual, textbook, or other written document “free” in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it,
either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of “copyleft”, which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

### 1.8.2 1. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. The “Document”, below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as “you”. A “Modified Version” of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language. A “Secondary Section” is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document’s overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (For example, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them. The “Invariant Sections” are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. The “Cover Texts” are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A “Transparent” copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, whose contents can be viewed and edited directly and straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup has been designed to thwart or discourage subsequent modification by readers is not Transparent. A copy that is not “Transparent” is called “Opaque”.

Examples of suitable formats for Transparent copies include plain ASCII without markup, TeXinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML designed for human modification. Opaque formats include PostScript, PDF, proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML produced by some word processors for output purposes only. The “Title Page” means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, “Title Page” means the text near the most prominent appearance of the work’s title, preceding the beginning of the body of the text.

### 1.8.3 2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.
1.8.4 3. COPYING IN QUANTITY

If you publish printed copies of the Document numbering more than 100, and the Document’s license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a publicly-accessible computer-network location containing a complete Transparent copy of the Document, free of added material, which the general network-using public has access to download anonymously at no charge using public-standard network protocols. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

1.8.5 4. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

- **A.** Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.

- **B.** List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has less than five).

- **C.** State on the Title Page the name of the publisher of the Modified Version, as the publisher.

- **D.** Preserve all the copyright notices of the Document.

- **E.** Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.

- **F.** Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.

- **G.** Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document’s license notice.

- **H.** Include an unaltered copy of this License.

- **I.** Preserve the section entitled “History”, and its title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section entitled “History” in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
• J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the “History” section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

• K. In any section entitled “Acknowledgements” or “Dedications”, preserve the section’s title, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

• L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

• M. Delete any section entitled “Endorsements”. Such a section may not be included in the Modified Version.

• N. Do not retitle any existing section as “Endorsements” or to conflict in title with any Invariant Section.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version’s license notice. These titles must be distinct from any other section titles.

You may add a section entitled “Endorsements”, provided it contains nothing but endorsements of your Modified Version by various parties–for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

1.8.6 5. COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections entitled “History” in the various original documents, forming one section entitled “History”; likewise combine any sections entitled “Acknowledgements”, and any sections entitled “Dedications”. You must delete all sections entitled “Endorsements.”

1.8.7 6. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is
included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and disbibute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

### 1.8.8 7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, does not as a whole count as a Modified Version of the Document, provided no compilation copyright is claimed for the compilation. Such a compilation is called an “aggregate”, and this License does not apply to the other self-contained works thus compiled with the Document, on account of their being thus compiled, if they are not themselves derivative works of the Document. If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one quarter of the entire aggregate, the Document’s Cover Texts may be placed on covers that surround only the Document within the aggregate. Otherwise they must appear on covers around the whole aggregate.

### 1.8.9 8. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License provided that you also include the original English version of this License. In case of a disagreement between the translation and the original English version of this License, the original English version will prevail.

### 1.8.10 9. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

### 1.8.11 10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License “or any later version” applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

### 1.8.12 Addendum

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:
Copyright © YEAR YOUR NAME.

Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.1 or any later version published by the Free Software Foundation; with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST. A copy of the license is included in the section entitled “GNU Free Documentation License”.

If you have no Invariant Sections, write “with no Invariant Sections” instead of saying which ones are invariant. If you have no Front-Cover Texts, write “no Front-Cover Texts” instead of “Front-Cover Texts being LIST”; likewise for Back-Cover Texts.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.
2.1 Video2Linux devices

2.1.1 Introduction

The V4L2 drivers tend to be very complex due to the complexity of the hardware: most devices have multiple ICs, export multiple device nodes in /dev, and create also non-V4L2 devices such as DVB, ALSA, FB, I2C and input (IR) devices.

Especially the fact that V4L2 drivers have to setup supporting ICs to do audio/video muxing/encoding/decoding makes it more complex than most. Usually these ICs are connected to the main bridge driver through one or more I2C busses, but other busses can also be used. Such devices are called ‘sub-devices’.

For a long time the framework was limited to the video_device struct for creating V4L device nodes and video_buf for handling the video buffers (note that this document does not discuss the video_buf framework).

This meant that all drivers had to do the setup of device instances and connecting to sub-devices themselves. Some of this is quite complicated to do right and many drivers never did do it correctly.

There is also a lot of common code that could never be refactored due to the lack of a framework.

So this framework sets up the basic building blocks that all drivers need and this same framework should make it much easier to refactor common code into utility functions shared by all drivers.

A good example to look at as a reference is the v4l2-pci-skeleton.c source that is available in samples/v4l/. It is a skeleton driver for a PCI capture card, and demonstrates how to use the V4L2 driver framework. It can be used as a template for real PCI video capture driver.

2.1.2 Structure of a V4L driver

All drivers have the following structure:

1. A struct for each device instance containing the device state.
2. A way of initializing and commanding sub-devices (if any).
3. Creating V4L2 device nodes (/dev/videoX, /dev/vbiX and /dev/radioX) and keeping track of device-node specific data.
4. Filehandle-specific structs containing per-filehandle data;
5. video buffer handling.

This is a rough schematic of how it all relates:

```
device instances
   +---sub-device instances
      |   -V4L2 device nodes
      |   \
      |   -filehandle instances
```

### 2.1.3 Structure of the V4L2 framework

The framework closely resembles the driver structure: it has a v4l2_device struct for the device instance data, a v4l2_subdev struct to refer to sub-device instances, the video_device struct stores V4L2 device node data and the v4l2_fh struct keeps track of filehandle instances.

The V4L2 framework also optionally integrates with the media framework. If a driver sets the struct v4l2_device mdev field, sub-devices and video nodes will automatically appear in the media framework as entities.

### 2.1.4 Video device’s internal representation

The actual device nodes in the /dev directory are created using the video_device struct (v4l2-dev.h). This struct can either be allocated dynamically or embedded in a larger struct.

To allocate it dynamically use `video_device_alloc()`:

```c
struct video_device *vdev = video_device_alloc();
if (vdev == NULL)
  return -ENOMEM;

vdev->release = video_device_release;
```

If you embed it in a larger struct, then you must set the release() callback to your own function:

```c
struct video_device *vdev = &my_vdev->vdev;

vdev->release = my_vdev_release;
```

The release() callback must be set and it is called when the last user of the video device exits.

The default `video_device_release()` callback currently just calls `kfree` to free the allocated memory.

There is also a `video_device_release_empty()` function that does nothing (is empty) and should be used if the struct is embedded and there is nothing to do when it is released.

You should also set these fields of `video_device`:

- `video_device->v4l2_dev`: must be set to the `v4l2_device` parent device.
- `video_device->name`: set to something descriptive and unique.
• `video_device->vfl_dir`: set this to `VFL_DIR_RX` for capture devices (`VFL_DIR_RX` has value 0, so this is normally already the default), set to `VFL_DIR_TX` for output devices and `VFL_DIR_M2M` for mem2mem (codec) devices.

• `video_device->fops`: set to the `v4l2_file_operations` struct.

• `video_device->ioctl_ops`: if you use the `v4l2_ioctl_ops` to simplify ioctl maintenance (highly recommended to use this and it might become compulsory in the future!), then set this to your `v4l2_ioctl_ops` struct. The `video_device->vfl_type` and `video_device->vfl_dir` fields are used to disable ops that do not match the type/dir combination. E.g. VBI ops are disabled for non-VBI nodes, and output ops are disabled for a capture device. This makes it possible to provide just one `v4l2_ioctl_ops` struct for both vbi and video nodes.

• `video_device->lock`: leave to `NULL` if you want to do all the locking in the driver. Otherwise you give it a pointer to a struct `mutex_lock` and before the `video_device->unlocked_ioctl` file operation is called this lock will be taken by the core and released afterwards. See the next section for more details.

• `video_device->queue`: a pointer to the struct `vb2_queue` associated with this device node. If queue is not `NULL`, and queue->lock is not `NULL`, then queue->lock is used for the queuing ioctls (`VIDIOC_REQBUFS`, `CREATE_BUFS`, `QBUF`, `DQBUF`, `QUERYBUF`, `PREPARE_BUF`, `STREAMON` and `STREAMOFF`) instead of the lock above. That way the `vb2` queuing framework does not have to wait for other ioctls. This queue pointer is also used by the `vb2` helper functions to check for queuing ownership (i.e. is the filehandle calling it allowed to do the operation).

• `video_device->prio`: keeps track of the priorities. Used to implement `VIDIOC_G_PRIORITY` and `VIDIOC_S_PRIORITY`. If left to `NULL`, then it will use the struct `v4l2_prio_state` in `v4l2_device`. If you want to have a separate priority state per (group of) device node(s), then you can point it to your own struct `v4l2_prio_state`.

• `video_device->dev_parent`: you only set this if `v4l2_device` was registered with `NULL` as the parent device struct. This only happens in cases where one hardware device has multiple PCI devices that all share the same `v4l2_device` core.

  The `cx88` driver is an example of this: one core `v4l2_device` struct, but it is used by both a raw video PCI device (`cx8800`) and a MPEG PCI device (`cx8802`). Since the `v4l2_device` cannot be associated with two PCI devices at the same time it is setup without a parent device. But when the struct `video_device` is initialized you do know which parent PCI device to use and so you set `dev_device` to the correct PCI device.

If you use `v4l2_ioctl_ops`, then you should set `video_device->unlocked_ioctl` to `video_ioctl2()` in your `v4l2_file_operations` struct.

In some cases you want to tell the core that a function you had specified in your `v4l2_ioctl_ops` should be ignored. You can mark such ioctls by calling this function before `video_register_device()` is called:

```
void v4l2_disable_ioctl(vdev, cmd);
```

This tends to be needed if based on external factors (e.g. which card is being used) you want to turn off certain features in `v4l2_ioctl_ops` without having to make a new struct.

The `v4l2_file_operations` struct is a subset of `file_operations`. The main difference is that the inode argument is omitted since it is never used.

If integration with the media framework is needed, you must initialize the `media_entity` struct embedded in the `video_device` struct (entity field) by calling `media_entity_pads_init()`:

```
struct media_pad *pad = &my_vdev->pad;
int err;

err = media_entity_pads_init(&vdev->entity, 1, pad);
```

The pads array must have been previously initialized. There is no need to manually set the struct media_entity type and name fields.

A reference to the entity will be automatically acquired/released when the video device is opened/closed.
The V4L core provides optional locking services. The main service is the lock field in struct `video_device`, which is a pointer to a mutex. If you set this pointer, then that will be used by `unlocked_ioctl` to serialize all ioctls.

If you are using the videobuf2 framework, then there is a second lock that you can set: `video_device->queue->lock`. If set, then this lock will be used instead of `video_device->lock` to serialize all queuing ioctls (see the previous section for the full list of those ioctls).

The advantage of using a different lock for the queuing ioctls is that for some drivers (particularly USB drivers) certain commands such as setting controls can take a long time, so you want to use a separate lock for the buffer queuing ioctls. That way your VIDIOC_DQBUF doesn’t stall because the driver is busy changing the e.g. exposure of the webcam.

Of course, you can always do all the locking yourself by leaving both lock pointers at NULL.

If you use the old videobuf framework then you must pass the `video_device->lock` to the videobuf queue initialize function: if videobuf has to wait for a frame to arrive, then it will temporarily unlock the lock and relock it afterwards. If your driver also waits in the code, then you should do the same to allow other processes to access the device node while the first process is waiting for something.

In the case of videobuf2 you will need to implement the `wait_prepare()` and `wait_finish()` callbacks to unlock/lock if applicable. If you use the `queue->lock` pointer, then you can use the helper functions `vb2_ops_wait_prepare()` and `vb2_ops_wait_finish()`.

The implementation of a hotplug disconnect should also take the lock from `video_device` before calling `v4l2_device_disconnect`. If you are also using `video_device->queue->lock`, then you have to first lock `video_device->queue->lock` followed by `video_device->lock`. That way you can be sure no ioctl is running when you call `v4l2_device_disconnect`.

### Video device registration

Next you register the video device with `video_register_device()`. This will create the character device for you.

```c
err = video_register_device(vdev, VFL_TYPE_GRABBER, -1);
if (err) {
    video_device_release(vdev); /* or kfree(my_vdev); */
    return err;
}
```

If the `v4l2_device` parent device has a not NULL mdev field, the video device entity will be automatically registered with the media device.

Which device is registered depends on the type argument. The following types exist:

- **VFL_TYPE_GRABBER**: `/dev/videoX` for video input/output devices
- **VFL_TYPE_VBI**: `/dev/vbiX` for vertical blank data (i.e. closed captions, teletext)
- **VFL_TYPE_RADIO**: `/dev/radioX` for radio tuners
- **VFL_TYPE_SDR**: `/dev/swradioX` for Software Defined Radio tuners

The last argument gives you a certain amount of control over the device device node number used (i.e. the X in videoX). Normally you will pass -1 to let the v4l2 framework pick the first free number. But sometimes users want to select a specific node number. It is common that drivers allow the user to select a specific device node number through a driver module option. That number is then passed to this function and `video_register_device` will attempt to select that device node number. If that number was already in use, then the next free device node number will be selected and it will send a warning to the kernel log.

Another use-case is if a driver creates many devices. In that case it can be useful to place different video devices in separate ranges. For example, video capture devices start at 0, video output devices start at 594...
16. So you can use the last argument to specify a minimum device node number and the v4l2 framework will try to pick the first free number that is equal or higher to what you passed. If that fails, then it will just pick the first free number.

Since in this case you do not care about a warning about not being able to select the specified device node number, you can call the function \texttt{video_register_device\_no\_warn()} instead.

Whenever a device node is created some attributes are also created for you. If you look in /sys/class/video4linux you see the devices. Go into e.g. video0 and you will see ‘name’, ‘dev\_debug’ and ‘index’ attributes. The ‘name’ attribute is the ‘name’ field of the video\_device struct. The ‘dev\_debug’ attribute can be used to enable core debugging. See the next section for more detailed information on this.

The ‘index’ attribute is the index of the device node: for each call to \texttt{video\_register\_device()} the index is just increased by 1. The first video device node you register always starts with index 0.

Users can setup udev rules that utilize the index attribute to make fancy device names (e.g. ‘mpegX’ for MPEG video capture device nodes).

After the device was successfully registered, then you can use these fields:

- \texttt{video\_device->vfl\_type}: the device type passed to \texttt{video\_register\_device()}.
- \texttt{video\_device->minor}: the assigned device minor number.
- \texttt{video\_device->num}: the device node number (i.e. the X in videoX).
- \texttt{video\_device->index}: the device index number.

If the registration failed, then you need to call \texttt{video\_device\_release()} to free the allocated \texttt{video\_device} struct, or free your own struct if the \texttt{video\_device} was embedded in it. The vdev->release() callback will never be called if the registration failed, nor should you ever attempt to unregister the device if the registration failed.

\section*{video device debugging}

The ‘dev\_debug’ attribute that is created for each video, vbi, radio or swradio device in /sys/class/video4linux/<devX>/ allows you to enable logging of file operations.

It is a bitmask and the following bits can be set:

<table>
<thead>
<tr>
<th>Mask</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01</td>
<td>Log the ioctl name and error code. VIDIOC_(D)QBUF ioctls are only logged if bit 0x08 is also set.</td>
</tr>
<tr>
<td>0x02</td>
<td>Log the ioctl name arguments and error code. VIDIOC_(D)QBUF ioctls are only logged if bit 0x08 is also set.</td>
</tr>
<tr>
<td>0x04</td>
<td>Log the file operations open, release, read, write, mmap and get_unmapped_area. The read and write operations are only logged if bit 0x08 is also set.</td>
</tr>
<tr>
<td>0x08</td>
<td>Log the read and write file operations and the VIDIOC_QBUF and VIDIOC_DQBUF ioctls.</td>
</tr>
<tr>
<td>0x10</td>
<td>Log the poll file operation.</td>
</tr>
</tbody>
</table>

\section*{Video device cleanup}

When the video device nodes have to be removed, either during the unload of the driver or because the USB device was disconnected, then you should unregister them with:

\begin{verbatim}
video_unregister_device() (vdev);
\end{verbatim}

This will remove the device nodes from sysfs (causing udev to remove them from /dev).

After \texttt{video\_unregister\_device()} returns no new opens can be done. However, in the case of USB devices some application might still have one of these device nodes open. So after the unregister all file operations (except release, of course) will return an error as well.
When the last user of the video device node exits, then the `vdev->release()` callback is called and you can do the final cleanup there.

Don’t forget to cleanup the media entity associated with the video device if it has been initialized:

```c
media_entity_cleanup (&vdev->entity);
```

This can be done from the release callback.

### helper functions

There are a few useful helper functions:

- file and `video_device` private data

You can set/get driver private data in the `video_device` struct using:

```c
video_get_drvdata (vdev);
video_set_drvdata (vdev);
```

Note that you can safely call `video_set_drvdata()` before calling `video_register_device()`.

And this function:

```c
video_devdata (struct file *file);
```

returns the `video_device` belonging to the file struct.

The `video_devdata()` function combines `video_get_drvdata()` with `video_devdata()`:

```c
video_drvdata (struct file *file);
```

You can go from a `video_device` struct to the `v4l2_device` struct using:

```c
struct v4l2_device *v4l2_dev = vdev->v4l2_dev;
```

- Device node name

The `video_device` node kernel name can be retrieved using:

```c
video_device_node_name (vdev);
```

The name is used as a hint by userspace tools such as udev. The function should be used where possible instead of accessing the `video_device::num` and `video_device::minor` fields.

### video_device functions and data structures

#### struct `v4l2_prio_state`

stores the priority states

**Definition**

```c
struct v4l2_prio_state {
  atomic_t prios[4];
};
```

**Members**

- `prios[4]`

  - `type`: `atomic_t`

    array with elements to store the array priorities
void \texttt{v4l2\_prio\_init}(\texttt{struct v4l2\_prio\_state} * \texttt{global})
\begin{verbatim}
initializes a struct v4l2\_prio\_state
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{struct v4l2\_prio\_state} * \texttt{global} pointer to \texttt{struct v4l2\_prio\_state}
\end{itemize}

int \texttt{v4l2\_prio\_change}(\texttt{struct v4l2\_prio\_state} * \texttt{global}, \texttt{enum v4l2\_priority} * \texttt{local}, \texttt{enum v4l2\_priority} \texttt{new})
\begin{verbatim}
changes the v4l2 file handler priority
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{struct v4l2\_prio\_state} * \texttt{global} pointer to the \texttt{struct v4l2\_prio\_state} of the device node.
  \item \texttt{enum v4l2\_priority} * \texttt{local} pointer to the desired priority, as defined by \texttt{enum v4l2\_priority}
  \item \texttt{enum v4l2\_priority} \texttt{new} Priority type requested, as defined by \texttt{enum v4l2\_priority}
\end{itemize}

\textbf{Description}

\textbf{Note:}

\begin{itemize}
  \item This function should be used only by the V4L2 core.
\end{itemize}

void \texttt{v4l2\_prio\_open}(\texttt{struct v4l2\_prio\_state} * \texttt{global}, \texttt{enum v4l2\_priority} * \texttt{local})
\begin{verbatim}
Implements the priority logic for a file handler open
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{struct v4l2\_prio\_state} * \texttt{global} pointer to the \texttt{struct v4l2\_prio\_state} of the device node.
  \item \texttt{enum v4l2\_priority} * \texttt{local} pointer to the desired priority, as defined by \texttt{enum v4l2\_priority}
\end{itemize}

\textbf{Description}

\textbf{Note:}

\begin{itemize}
  \item This function should be used only by the V4L2 core.
\end{itemize}

void \texttt{v4l2\_prio\_close}(\texttt{struct v4l2\_prio\_state} * \texttt{global}, \texttt{enum v4l2\_priority} \texttt{local})
\begin{verbatim}
Implements the priority logic for a file handler close
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{struct v4l2\_prio\_state} * \texttt{global} pointer to the \texttt{struct v4l2\_prio\_state} of the device node.
  \item \texttt{enum v4l2\_priority} \texttt{local} priority to be released, as defined by \texttt{enum v4l2\_priority}
\end{itemize}

\textbf{Description}

\textbf{Note:}

\begin{itemize}
  \item This function should be used only by the V4L2 core.
\end{itemize}
enum v4l2_priority v4l2_prio_max(struct v4l2_prio_state * global)
Return the maximum priority, as stored at the global array.

Parameters
struct v4l2_prio_state * global pointer to the struct v4l2_prio_state of the device node.

Description

**Note:**
This function should be used only by the V4L2 core.

int v4l2_prio_check(struct v4l2_prio_state * global, enum v4l2_priority local)
Implements the priority logic for a file handler close

Parameters
struct v4l2_prio_state * global pointer to the struct v4l2_prio_state of the device node.
enum v4l2_priority local desired priority, as defined by enum v4l2_priority local

Description

**Note:**
This function should be used only by the V4L2 core.

struct v4l2_file_operations
fs operations used by a V4L2 device

**Definition**

```c
struct v4l2_file_operations {
    struct module * owner;
    ssize_t (* read) (struct file *, char __user *, size_t, loff_t *);
    ssize_t (* write) (struct file *, const char __user *, size_t, loff_t *);
    unsigned int (* poll) (struct file *, struct poll_table_struct *);
    long (* unlocked_ioctl) (struct file *, unsigned int, unsigned long);
    #ifdef CONFIG_COMPAT
    long (* compat_ioctl32) (struct file *, unsigned int, unsigned long);
    #endif
    unsigned long (* get_unmapped_area) (struct file *, unsigned long,unsigned long, unsigned long);
    int (* mmap) (struct file *, struct vm_area_struct *);
    int (* open) (struct file *);
    int (* release) (struct file *);
};
```

**Members**

owner

- **type:** struct module *
  pointer to struct module

read

- **type:** ssize_t (*) (struct file *, char __user *, size_t, loff_t *)
  operations needed to implement the read() syscall

write
• **write**: `ssize_t (*)(struct file *, const char __user *, size_t, loff_t *)`
  operations needed to implement the *write()* syscall

**poll**

• **poll**: `unsigned int (*)(struct file *, struct poll_table_struct *)`
  operations needed to implement the *poll()* syscall

**unlocked_ioctl**

• **ioctl**: `long (*)(struct file *, unsigned int, unsigned long)`
  operations needed to implement the *ioctl()* syscall

**compat_ioctl32**

• **ioctl**: `long (*)(struct file *, unsigned int, unsigned long)`
  operations needed to implement the *ioctl()* syscall for the special case where the Kernel uses 64 bits instructions, but the userspace uses 32 bits.

**get_unmapped_area**

• **get_unmapped_area**: `unsigned long (*)(struct file *, unsigned long, unsigned long, unsigned long, unsigned long)`
  called by the *mmap()* syscall, used when %!CONFIG_MMU

**mmap**

• **mmap**: `int (*)(struct file *, struct vm_area_struct *)`
  operations needed to implement the *mmap()* syscall

**open**

• **open**: `int (*)(struct file *)`
  operations needed to implement the *open()* syscall

**release**

• **release**: `int (*)(struct file *)`
  operations needed to implement the *release()* syscall

**Description**

**Note:**

Those operations are used to implement the fs struct file_operations at the V4L2 drivers. The V4L2 core overrides the fs ops with some extra logic needed by the subsystem.

**struct video_device**

Structure used to create and manage the V4L2 device nodes.

**Definition**

```c
struct video_device {
  #if defined(CONFIG_MEDIA_CONTROLLER)
    struct media_entity entity;
    struct media_intf_devnode * intf_devnode;
    struct media_pipeline pipe;
  #endif
  const struct v4l2_file_operations * fops;
  u32 device_caps;
  struct device dev;
  struct cdev * cdev;
}
```
struct v4l2_device * v4l2_dev;
struct device * dev_parent;
struct v4l2_ctrl_handler * ctrl_handler;
struct vb2_queue * queue;
struct v4l2_prio_state * prio;
char name[32];
int vfl_type;
int vfl_dir;
int minor;
ul6 num;
unsigned long flags;
int index;
spinlock_t fh_lock;
struct list_head fh_list;
int dev_debug;
v4l2_std_id tvnorms;
void (* release) (struct video_device *vdev);
const struct v4l2_ioctl_ops * ioctl_ops;
unsigned long valid_ioctls[BITS_TO_LONGS(BASE_VIDIOC_PRIVATE)];
unsigned long disable_locking[BITS_TO_LONGS(BASE_VIDIOC_PRIVATE)];
struct mutex * lock;
};

Members

entity

• **type**: struct media_entity

  struct media_entity

intf_devnode

• **type**: struct media_intf_devnode *

  pointer to struct media_intf_devnode

pipe

• **type**: struct media_pipeline

  struct media_pipeline

fops

• **type**: const struct v4l2_file_operations *

  pointer to struct v4l2_file_operations for the video device

device_caps

• **type**: u32

  device capabilities as used in v4l2_capabilities

dev

• **type**: struct device

  struct device for the video device
cdev

• **type**: struct cdev *

  character device

v4l2_dev

• **type**: struct v4l2_device *
pointer to `struct v4l2_device` parent

device_parent
  • type: struct device *
  pointer to struct device parent

ctrl_handler
  • type: struct v4l2_ctrl_handler *
  Control handler associated with this device node. May be NULL.

queue
  • type: struct vb2_queue *
  `struct vb2_queue` associated with this device node. May be NULL.

prio
  • type: struct v4l2_prio_state *
  pointer to `struct v4l2_prio_state` with device’s Priority state. If NULL, then v4l2_dev->prio will be used.

ame[32]
  • type: char
  video device name

vfl_type
  • type: int
  V4L device type

vfl_dir
  • type: int
  V4L receiver, transmitter or m2m

minor
  • type: int
  device node ‘minor’. It is set to -1 if the registration failed

num
  • type: u16
  number of the video device node

flags
  • type: unsigned long
  video device flags. Use bitops to set/clear/test flags

index
  • type: int
  attribute to differentiate multiple indices on one physical device

fh_lock
  • type: spinlock_t
  Lock for all v4l2_fhs

fh_list
• **type**: struct list_head
  List of *struct v4l2_fh*

**dev_debug**
• **type**: int
  Internal device debug flags, not for use by drivers

**tvnorms**
• **type**: v4l2_std_id
  Supported tv norms

**release**
• **type**: void (*)(struct video_device *vdev)
  video device release() callback

**ioctl_ops**
• **type**: const struct v4l2_ioctl_ops *
  pointer to *struct v4l2_ioctl_ops* with ioctl callbacks

**valid_ioctls[BITS_TO_LONGS(BASE_VIDIOC_PRIVATE)]**
• **type**: unsigned long
  bitmap with the valid ioctls for this device

**disable_locking[BITS_TO_LONGS(BASE_VIDIOC_PRIVATE)]**
• **type**: unsigned long
  bitmap with the ioctls that don’t require locking

**lock**
• **type**: struct mutex *
  pointer to struct mutex serialization lock

**Description**

**Note:**

*Only set dev_parent if that can’t be deduced from v4l2_dev.*

```c
int __video_register_device(struct video_device *vdev, int type, int nr, int warn_if_nr_in_use, struct module *owner)
    register video4linux devices
```

**Parameters**

- **struct video_device * vdev** struct video_device to register
- **int type** type of device to register
- **int nr** which device node number is desired: (0 == /dev/video0, 1 == /dev/video1, ..., -1 == first free)
- **int warn_if_nr_in_use** warn if the desired device node number was already in use and another number was chosen instead.
- **struct module * owner** module that owns the video device node
Description
The registration code assigns minor numbers and device node numbers based on the requested type and registers the new device node with the kernel.
This function assumes that struct video_device was zeroed when it was allocated and does not contain any stale date.
An error is returned if no free minor or device node number could be found, or if the registration of the device node failed.
Returns 0 on success.
Valid values for type are:
• VFL_TYPE_GRABBER - A frame grabber
• VFL_TYPE_VBI - Vertical blank data (undecoded)
• VFL_TYPE_RADIO - A radio card
• VFL_TYPE_SUBDEV - A subdevice
• VFL_TYPE_SDR - Software Defined Radio

Note:
This function is meant to be used only inside the V4L2 core. Drivers should use video_register_device() or video_register_device_no_warn().

int video_register_device(struct video_device * vdev, int type, int nr)
register video4linux devices
Parameters
struct video_device * vdev struct video_device to register
int type type of device to register
int nr which device node number is desired: (0 == /dev/video0, 1 == /dev/video1, ..., -1 == first free)

Description
Internally, it calls __video_register_device(). Please see its documentation for more details.

Note:
If video_register_device fails, the release() callback of struct video_device structure is not called, so the caller is responsible for freeing any data. Usually that means that you video_device_release() should be called on failure.

int video_register_device_no_warn(struct video_device * vdev, int type, int nr)
register video4linux devices
Parameters
struct video_device * vdev struct video_device to register
int type type of device to register
int nr which device node number is desired: (0 == /dev/video0, 1 == /dev/video1, ..., -1 == first free)

Description
This function is identical to video_register_device() except that no warning is issued if the desired device node number was already in use.
Internally, it calls `__video_register_device()`. Please see its documentation for more details.

**Note:**

*If `video_register_device` fails, the release() callback of struct video_device structure is not called, so the caller is responsible for freeing any data. Usually that means that you video_device_release() should be called on failure.*

```c
void video_unregister_device(struct video_device * vdev)
    Unregister video devices.

Parameters
struct video_device * vdev struct video_device to register

Description
Does nothing if vdev == NULL or if video_is_registered() returns false.
```

```c
 struct video_device * video_device_alloc(void)
     helper function to alloc struct video_device

Parameters
void no arguments

Description
Returns NULL if -ENOMEM or a struct video_device on success.
```

```c
void video_device_release(struct video_device * vdev)
    helper function to release struct video_device

Parameters
struct video_device * vdev pointer to struct video_device

Description
Can also be used for video_device->release().
```

```c
void video_device_release_empty(struct video_device * vdev)
    helper function to implement the video_device->release() callback.

Parameters
struct video_device * vdev pointer to struct video_device

Description
This release function does nothing.
It should be used when the video_device is a static global struct.

**Note:**

*Having a static video_device is a dubious construction at best.*

```c
bool v4l2_is_known_ioctl(unsigned int cmd)
    Checks if a given cmd is a known V4L ioctl

Parameters
unsigned int cmd ioctl command

Description
returns true if cmd is a known V4L ioctl
void v4l2_disable_ioctl(struct video_device * vdev, unsigned int cmd)
mark that a given command isn’t implemented. shouldn’t use core locking

Parameters
struct video_device * vdev pointer to struct video_device
unsigned int cmd ioctl command

Description
This function allows drivers to provide just one v4l2_ioctl_ops struct, but disable ioctls based on the specific

card that is actually found.

Note:
This must be called before video_register_device. See also the comments for determine_valid_ioctls().

void * video_get_drvdata(struct video_device * vdev)
gets private data from struct video_device.

Parameters
struct video_device * vdev pointer to struct video_device

Description
returns a pointer to the private data

void video_set_drvdata(struct video_device * vdev, void * data)
sets private data from struct video_device.

Parameters
struct video_device * vdev pointer to struct video_device
void * data private data pointer

struct video_device * video_devdata(struct file * file)
gets struct video_device from struct file.

Parameters
struct file * file pointer to struct file

void * video_drvdata(struct file * file)
gets private data from struct video_device using the struct file.

Parameters
struct file * file pointer to struct file

Description
This is function combines both video_get_drvdata() and video_devdata() as this is used very often.

const char * video_device_node_name(struct video_device * vdev)
returns the video device name

Parameters
struct video_device * vdev pointer to struct video_device

Description
Returns the device name string

int video_is_registered(struct video_device * vdev)
returns true if the struct video_device is registered.
Parameters

`struct video_device * vdev` pointer to `struct video_device`

Description

2.1.5 V4L2 device instance

Each device instance is represented by a struct `v4l2_device`. Very simple devices can just allocate this struct, but most of the time you would embed this struct inside a larger struct.

You must register the device instance by calling:

```
  v4l2_device_register (dev, v4l2_dev);
```

Registration will initialize the `v4l2_device` struct. If the `dev->driver_data` field is `NULL`, it will be linked to `v4l2_dev` argument.

Drivers that want integration with the media device framework need to set `dev->driver_data` manually to point to the driver-specific device structure that embed the struct `v4l2_device` instance. This is achieved by a `dev_set_drvdata()` call before registering the V4L2 device instance. They must also set the struct `v4l2_device` `mdev` field to point to a properly initialized and registered `media_device` instance.

If `v4l2_dev->name` is empty then it will be set to a value derived from `dev` (driver name followed by the `bus_id`, to be precise). If you set it up before calling `v4l2_device_register()` then it will be untouched. If `dev` is `NULL`, then you **must** setup `v4l2_dev->name` before calling `v4l2_device_register()`.

You can use `v4l2_device_set_name()` to set the name based on a driver name and a driver-global atomic_t instance. This will generate names like `ivtv0`, `ivtv1`, etc. If the name ends with a digit, then it will insert a dash: `cx18-0`, `cx18-1`, etc. This function returns the instance number.

The first `dev` argument is normally the struct `device` pointer of a `pci_dev`, `usb_interface` or `platform_device`. It is rare for `dev` to be `NULL`, but it happens with ISA devices or when one device creates multiple PCI devices, thus making it impossible to associate `v4l2_dev` with a particular parent.

You can also supply a `notify()` callback that can be called by sub-devices to notify you of events. Whether you need to set this depends on the sub-device. Any notifications a sub-device supports must be defined in a header in include/media/subdevice.h.

V4L2 devices are unregistered by calling:

```
  v4l2_device_unregister() (v4l2_dev);
```

If the `dev->driver_data` field points to `v4l2_dev`, it will be reset to `NULL`. Unregistering will also automatically unregister all subdevs from the device.

If you have a hotpluggable device (e.g. a USB device), then when a disconnect happens the parent device becomes invalid. Since `v4l2_device` has a pointer to that parent device it has to be cleared as well to mark that the parent is gone. To do this call:

```
  v4l2_device_disconnect() (v4l2_dev);
```

This does not unregister the subdevs, so you still need to call the `v4l2_device_unregister()` function for that. If your driver is not hotpluggable, then there is no need to call `v4l2_device_disconnect()`.

Sometimes you need to iterate over all devices registered by a specific driver. This is usually the case if multiple device drivers use the same hardware. E.g. the `ivtvfb` driver is a framebuffer driver that uses the `ivtv` hardware. The same is true for alsa drivers for example.

You can iterate over all registered devices as follows:

```c
static int callback(struct device *dev, void *p)
{
  struct v4l2_device *v4l2_dev = dev_get_drvdata(dev);

  /* test if this device was inited */
  if (v4l2_dev == NULL)
```
Sometimes you need to keep a running counter of the device instance. This is commonly used to map a device instance to an index of a module option array.

The recommended approach is as follows:

```c
static atomic_t drv_instance = ATOMIC_INIT(0);
static int drv_probe(struct pci_dev *pdev, const struct pci_device_id *pci_id) {
    ...  
    state->instance = atomic_inc_return(&drv_instance) - 1;
}
```

If you have multiple device nodes then it can be difficult to know when it is safe to unregister `v4l2_device` for hotpluggable devices. For this purpose `v4l2_device` has refcounting support. The refcount is increased whenever `video_register_device()` is called and it is decreased whenever that device node is released. When the refcount reaches zero, then the `v4l2_device` release() callback is called. You can do your final cleanup there.

If other device nodes (e.g. ALSA) are created, then you can increase and decrease the refcount manually as well by calling:

```c
v4l2_device_get() (v4l2_dev).
```
or:

```c
v4l2_device_put() (v4l2_dev).
```

Since the initial refcount is 1 you also need to call `v4l2_device_put()` in the disconnect() callback (for USB devices) or in the remove() callback (for e.g. PCI devices), otherwise the refcount will never reach 0.

### v4l2_device functions and data structures

#### struct v4l2_device

Main struct to for V4L2 device drivers

**Definition**

```c
struct v4l2_device {
    struct device * dev;
    #if defined(CONFIG_MEDIA_CONTROLLER)
        struct media_device * mdev;
    #endif
    struct list_head subdevs;
}
```

---

2.1. Video2Linux devices
spinlock_t lock;
char name[V4L2_DEVICE_NAME_SIZE];
void (* notify) (struct v4l2_subdev *sd, unsigned int notification, void *arg);
struct v4l2_ctrl_handler * ctrl_handler;
struct v4l2_prio_state prio;
struct kref ref;
void (* release) (struct v4l2_device *v4l2_dev);
};

Members

dev

• **type**: struct device *
  pointer to struct device.

mdev

• **type**: struct media_device *
  pointer to struct media_device

subdevs

• **type**: struct list_head
  used to keep track of the registered subdevs

lock

• **type**: spinlock_t
  lock this struct; can be used by the driver as well if this struct is embedded into a larger struct.

name[V4L2_DEVICE_NAME_SIZE]

• **type**: char
  unique device name, by default the driver name + bus ID

notify

• **type**: void (*)(struct v4l2_subdev *sd, unsigned int notification, void *arg)
  notify callback called by some sub-devices.

ctrl_handler

• **type**: struct v4l2_ctrl_handler *
  The control handler. May be NULL.

prio

• **type**: struct v4l2_prio_state
  Device’s priority state

ref

• **type**: struct kref
  Keep track of the references to this struct.

release

• **type**: void (*)(struct v4l2_device *v4l2_dev)
  Release function that is called when the ref count goes to 0.
Description
Each instance of a V4L2 device should create the v4l2_device struct, either stand-alone or embedded in a larger struct.

It allows easy access to sub-devices (see v4l2-subdev.h) and provides basic V4L2 device-level support.

**Note:**

1. dev->driver_data points to this struct.
2. dev might be NULL if there is no parent device

```c
void v4l2_device_get(struct v4l2_device * v4l2_dev)
gets a V4L2 device reference
```

**Parameters**

struct v4l2_device * v4l2_dev  pointer to struct v4l2_device

**Description**

This is an ancillary routine meant to increment the usage for the struct v4l2_device pointed by v4l2_dev.

```c
int v4l2_device_put(struct v4l2_device * v4l2_dev)
putss a V4L2 device reference
```

**Parameters**

struct v4l2_device * v4l2_dev  pointer to struct v4l2_device

**Description**

This is an ancillary routine meant to decrement the usage for the struct v4l2_device pointed by v4l2_dev.

```c
int v4l2_device_register(struct device * dev, struct v4l2_device * v4l2_dev)
Initialize v4l2_dev and make dev->driver_data point to v4l2_dev.
```

**Parameters**

struct device * dev  pointer to struct device

struct v4l2_device * v4l2_dev  pointer to struct v4l2_device

**Note:**

dev may be NULL in rare cases (ISA devices). In such case the caller must fill in the v4l2_dev->name field before calling this function.

```c
int v4l2_device_set_name(struct v4l2_device * v4l2_dev, const char * basename, atomic_t * instance)
Optional function to initialize the name field of struct v4l2_device
```

**Parameters**

struct v4l2_device * v4l2_dev  pointer to struct v4l2_device

const char * basename  base name for the device name

atomic_t * instance  pointer to a static atomic_t var with the instance usage for the device driver.

**Description**

2.1. Video2Linux devices
\texttt{v4l2\_device\_set\_name()} initializes the name field of struct \texttt{v4l2\_device} using the driver name and a driver-global \texttt{atomic\_t} instance. This function will increment the instance counter and returns the instance value used in the name.

**Example**

```c
static atomic\_t drv\_instance = ATOMIC\_INIT(0);
...
instance = v4l2\_device\_set\_name(v4l2\_dev, "foo", drv\_instance);
```

The first time this is called the name field will be set to foo0 and this function returns 0. If the name ends with a digit (e.g. cx18), then the name will be set to cx18-0 since cx180 would look really odd.

**void \texttt{v4l2\_device\_disconnect}(struct \texttt{v4l2\_device} * \texttt{v4l2\_dev})**

Change V4L2 device state to disconnected.

**Parameters**

\texttt{struct \texttt{v4l2\_device} * \texttt{v4l2\_dev}} pointer to struct \texttt{v4l2\_device}

**Description**

Should be called when the USB parent disconnects. Since the parent disappears, this ensures that \texttt{v4l2\_dev} doesn’t have an invalid parent pointer.

**Note:**

\texttt{This function sets v4l2\_dev->dev to NULL.}

**void \texttt{v4l2\_device\_unregister}(struct \texttt{v4l2\_device} * \texttt{v4l2\_dev})**

Unregister all sub-devices and any other resources related to \texttt{v4l2\_dev}.

**Parameters**

\texttt{struct \texttt{v4l2\_device} * \texttt{v4l2\_dev}} pointer to struct \texttt{v4l2\_device}

**int \texttt{v4l2\_device\_register\_subdev}(struct \texttt{v4l2\_device} * \texttt{v4l2\_dev}, struct \texttt{v4l2\_subdev} * \texttt{sd})**

Registers a subdev with a \texttt{v4l2\_device}.

**Parameters**

\texttt{struct \texttt{v4l2\_device} * \texttt{v4l2\_dev}} pointer to struct \texttt{v4l2\_device}

\texttt{struct \texttt{v4l2\_subdev} * \texttt{sd}} pointer to struct \texttt{v4l2\_subdev}

**Description**

While registered, the subdev module is marked as in-use.

An error is returned if the module is no longer loaded on any attempts to register it.

**void \texttt{v4l2\_device\_unregister\_subdev}(struct \texttt{v4l2\_subdev} * \texttt{sd})**

Unregisters a subdev with a \texttt{v4l2\_device}.

**Parameters**

\texttt{struct \texttt{v4l2\_subdev} * \texttt{sd}} pointer to struct \texttt{v4l2\_subdev}

**Description**

\texttt{Note:}

\texttt{Can also be called if the subdev wasn’t registered. In such case, it will do nothing.}
int \texttt{v4l2\_device\_register\_subdev\_nodes}(\texttt{struct v4l2\_device * v4l2\_dev})

Registers device nodes for all subdevs of the v4l2 device that are marked with the V4L2\_SUBDEV\_FL\_HAS\_DEVNODE flag.

**Parameters**

\texttt{struct v4l2\_device * v4l2\_dev} pointer to \texttt{struct v4l2\_device}

\texttt{void v4l2\_subdev\_notify}(\texttt{struct v4l2\_subdev * sd, unsigned int notification, void * arg})

Sends a notification to \texttt{v4l2\_device}.

**Parameters**

\texttt{struct v4l2\_subdev * sd} pointer to \texttt{struct v4l2\_subdev}

\texttt{unsigned int notification} type of notification. Please notice that the notification type is driver-specific.

\texttt{void * arg} arguments for the notification. Those are specific to each notification type.

### 2.1.6 V4L2 File handlers

\texttt{struct v4l2\_fh} provides a way to easily keep file handle specific data that is used by the V4L2 framework.

**Attention:**

New drivers must use \texttt{struct v4l2\_fh} since it is also used to implement priority handling (\texttt{ioctl VIDIOC\_G\_PRIORITY, VIDIOC\_S\_PRIORITY}).

The users of \texttt{v4l2\_fh} (in the V4L2 framework, not the driver) know whether a driver uses \texttt{v4l2\_fh} as its file->private\_data pointer by testing the V4L2\_FL\_USES\_V4L2\_FH bit in \texttt{video\_device}->flags. This bit is set whenever \texttt{v4l2\_fh\_init()} is called.

\texttt{struct v4l2\_fh} is allocated as a part of the driver’s own file handle structure and file->private\_data is set to it in the driver’s \texttt{open()} function by the driver.

In many cases the \texttt{struct v4l2\_fh} will be embedded in a larger structure. In that case you should call:

1. \texttt{v4l2\_fh\_init()} and \texttt{v4l2\_fh\_add()} in \texttt{open()}
2. \texttt{v4l2\_fh\_del()} and \texttt{v4l2\_fh\_exit()} in \texttt{release()}

Drivers can extract their own file handle structure by using the \texttt{container\_of} macro.

**Example:**

```c
struct my_fh {
    int blah;
    struct v4l2_fh fh;
};
...

int my_open(struct file *file)
{
    struct my_fh *my_fh;
    struct video_device *vfd;
    int ret;

    ...

    my_fh = kzalloc(sizeof(*my_fh), GFP_KERNEL);
    ...
```
v4l2_fh_init(&my_fh->fh, vfd);
...
file->private_data = &my_fh->fh;
v4l2_fh_add(&my_fh->fh);
return 0;
}

int my_release(struct file *file)
{
    struct v4l2_fh *fh = file->private_data;
    struct my_fh *my_fh = container_of(fh, struct my_fh, fh);
    ...;
v4l2_fh_del(&my_fh->fh);
v4l2_fh_exit(&my_fh->fh);
kfree(my_fh);
return 0;
}

Below is a short description of the v4l2_fh functions used:

v4l2_fh_init (fh, vdev)
• Initialise the file handle. This MUST be performed in the driver's v4l2_file_operations->open() handler.

v4l2_fh_add (fh)
• Add a v4l2_fh to video_device file handle list. Must be called once the file handle is completely initialized.

v4l2_fh_del (fh)
• Unassociate the file handle from video_device. The file handle exit function may now be called.

v4l2_fh_exit (fh)
• Uninitialise the file handle. After uninitialisation the v4l2_fh memory can be freed.

If struct v4l2_fh is not embedded, then you can use these helper functions:

v4l2_fh_open (struct file *filp)
• This allocates a struct v4l2_fh, initializes it and adds it to the struct video_device associated with the file struct.

v4l2_fh_release (struct file *filp)
• This deletes it from the struct video_device associated with the file struct, uninitialised the v4l2_fh and frees it.

These two functions can be plugged into the v4l2_file_operation's open() and release() ops.

Several drivers need to do something when the first file handle is opened and when the last file handle closes. Two helper functions were added to check whether the v4l2_fh struct is the only open filehandle of the associated device node:

v4l2_fh_is_singular (fh)
• Returns 1 if the file handle is the only open file handle, else 0.

v4l2_fh_is_singular_file (struct file *filp)
• Same, but it calls v4l2_fh_is_singular with filp->private_data.
V4L2 fh functions and data structures

struct v4l2_fh
Describes a V4L2 file handler

Definition

struct v4l2_fh {
    struct list_head list;
    struct video_device * vdev;
    struct v4l2_ctrl_handler * ctrl_handler;
    enum v4l2_priority prio;
    wait_queue_head_t wait;
    struct list_head subscribed;
    struct list_head available;
    unsigned int navailable;
    u32 sequence;
#if IS_ENABLED(CONFIG_V4L2_MEM2MEM_DEV)
    struct v4l2_m2m_ctx * m2m_ctx;
#endif
};

Members

list
    • type: struct list_head
    list of file handlers

vdev
    • type: struct video_device *
    pointer to struct video_device

ctrl_handler
    • type: struct v4l2_ctrl_handler *
    pointer to struct v4l2_ctrl_handler

prio
    • type: enum v4l2_priority
    priority of the file handler, as defined by enum v4l2_priority

wait
    • type: wait_queue_head_t
    event's wait queue

subscribed
    • type: struct list_head
    list of subscribed events

available
    • type: struct list_head
    list of events waiting to be dequeued

navailable
    • type: unsigned int
    number of available events at available list
sequence
  • type: u32
    event sequence number

m2m_ctx
  • type: struct v4l2_m2m_ctx *
    pointer to struct v4l2_m2m_ctx

define void v4l2_fh_init(struct v4l2_fh * fh, struct video_device * vdev)
    Initialise the file handle.

Parameters
  struct v4l2_fh * fh pointer to struct v4l2_fh
  struct video_device * vdev pointer to struct video_device

Description
Parts of the V4L2 framework using the file handles should be initialised in this function. Must be called from driver’s v4l2_file_operations->open() handler if the driver uses struct v4l2_fh.

void v4l2_fh_add(struct v4l2_fh * fh)
  Add the fh to the list of file handles on a video_device.

Parameters
  struct v4l2_fh * fh pointer to struct v4l2_fh

Description

**Note:**
The fh file handle must be initialised first.

int v4l2_fh_open(struct file * filp)
  Ancillary routine that can be used as the open() op of v4l2_file_operations.

Parameters
  struct file * filp pointer to struct file

Description
It allocates a v4l2_fh and inits and adds it to the struct video_device associated with the file pointer.

void v4l2_fh_del(struct v4l2_fh * fh)
  Remove file handle from the list of file handles.

Parameters
  struct v4l2_fh * fh pointer to struct v4l2_fh

Description
On error filp->private_data will be NULL, otherwise it will point to the struct v4l2_fh.

**Note:**
Must be called in v4l2_file_operations->release() handler if the driver uses struct v4l2_fh.

void v4l2_fh_exit(struct v4l2_fh * fh)
  Release resources related to a file handle.
Parameters
struct v4l2_fh * fh pointer to struct v4l2_fh

Description
Parts of the V4L2 framework using the v4l2_fh must release their resources here, too.

Note:
Must be called in v4l2_file_operations->release() handler if the driver uses struct v4l2_fh.

int v4l2_fh_release(struct file * filp)
Ancillary routine that can be used as the release() op of v4l2_file_operations.

Parameters
struct file * filp pointer to struct file

Description
It deletes and exits the v4l2_fh associated with the file pointer and frees it. It will do nothing if filp->private_data (the pointer to the v4l2_fh struct) is NULL.
This function always returns 0.

int v4l2_fh_is_singular(struct v4l2_fh * fh)
Returns 1 if this filehandle is the only filehandle opened for the associated video_device.

Parameters
struct v4l2_fh * fh pointer to struct v4l2_fh

Description
If fh is NULL, then it returns 0.

int v4l2_fh_is_singular_file(struct file * filp)
Returns 1 if this filehandle is the only filehandle opened for the associated video_device.

Parameters
struct file * filp pointer to struct file

Description
This is a helper function variant of v4l2_fh_is_singular() with uses struct file as argument.
If filp->private_data is NULL, then it will return 0.

2.1.7 V4L2 sub-devices

Many drivers need to communicate with sub-devices. These devices can do all sort of tasks, but most commonly they handle audio and/or video muxing, encoding or decoding. For webcams common sub-devices are sensors and camera controllers.

Usually these are I2C devices, but not necessarily. In order to provide the driver with a consistent interface to these sub-devices the v4l2_subdev struct (v4l2-subdev.h) was created.

Each sub-device driver must have a v4l2_subdev struct. This struct can be stand-alone for simple sub-devices or it might be embedded in a larger struct if more state information needs to be stored. Usually there is a low-level device struct (e.g. i2c_client) that contains the device data as setup by the kernel. It is recommended to store that pointer in the private data of v4l2_subdev using v4l2_set_subdevdata(). That makes it easy to go from a v4l2_subdev to the actual low-level bus-specific device data.
You also need a way to go from the low-level struct to \texttt{v4l2\_subdev}. For the common i2c\_client struct the \texttt{i2c\_set\_clientdata()} call is used to store a \texttt{v4l2\_subdev} pointer, for other busses you may have to use other methods.

Bridges might also need to store per-subdev private data, such as a pointer to bridge-specific per-subdev private data. The \texttt{v4l2\_subdev} structure provides host private data for that purpose that can be accessed with \texttt{v4l2\_get\_subdev\_hostdata()} and \texttt{v4l2\_set\_subdev\_hostdata()}.

From the bridge driver perspective, you load the sub-device module and somehow obtain the \texttt{v4l2\_subdev} pointer. For i2c devices this is easy: you call \texttt{i2c\_get\_clientdata()}. For other busses something similar needs to be done. Helper functions exists for sub-devices on an I2C bus that do most of this tricky work for you.

Each \texttt{v4l2\_subdev} contains function pointers that sub-device drivers can implement (or leave NULL if it is not applicable). Since sub-devices can do so many different things and you do not want to end up with a huge ops struct of which only a handful of ops are commonly implemented, the function pointers are sorted according to category and each category has its own ops struct.

The top-level ops struct contains pointers to the category ops structs, which may be NULL if the subdev driver does not support anything from that category.

It looks like this:

```c
struct v4l2_subdev_core_ops {
    int (*log_status)(struct v4l2_subdev *sd);
    int (*init)(struct v4l2_subdev *sd, u32 val);
    ...
};

struct v4l2_subdev_tuner_ops {
    ...
};

struct v4l2_subdev_audio_ops {
    ...
};

struct v4l2_subdev_video_ops {
    ...
};

struct v4l2_subdev_pad_ops {
    ...
};

struct v4l2_subdev_ops {
    const struct v4l2_subdev_core_ops *core;
    const struct v4l2_subdev_tuner_ops *tuner;
    const struct v4l2_subdev_audio_ops *audio;
    const struct v4l2_subdev_video_ops *video;
    const struct v4l2_subdev_pad_ops *video;
};
```

The core ops are common to all subdevs, the other categories are implemented depending on the subdevice. E.g. a video device is unlikely to support the audio ops and vice versa.

This setup limits the number of function pointers while still making it easy to add new ops and categories.

A sub-device driver initializes the \texttt{v4l2\_subdev} struct using:

\texttt{v4l2\_subdev\_init (sd, &ops)}.

Afterwards you need to initialize \texttt{sd->name} with a unique name and set the module owner. This is done for you if you use the i2c helper functions.
If integration with the media framework is needed, you must initialize the `media_entity` struct embedded in the `v4l2_subdev` struct (entity field) by calling `media_entity_pads_init()`, if the entity has pads:

```c
struct media_pad *pads = &my_sd->pads;
int err;
err = media_entity_pads_init(&sd->entity, npads, pads);
```

The pads array must have been previously initialized. There is no need to manually set the struct `media_entity` function and name fields, but the revision field must be initialized if needed.

A reference to the entity will be automatically acquired/released when the subdev device node (if any) is opened/closed.

Don’t forget to cleanup the media entity before the sub-device is destroyed:

```c
media_entity_cleanup(&sd->entity);
```

If the subdev driver intends to process video and integrate with the media framework, it must implement format related functionality using `v4l2_subdev_pad_ops` instead of `v4l2_subdev_video_ops`.

In that case, the subdev driver may set the `link_validate` field to provide its own link validation function. The link validation function is called for every link in the pipeline where both of the ends of the links are V4L2 sub-devices. The driver is still responsible for validating the correctness of the format configuration between sub-devices and video nodes.

If `link_validate` op is not set, the default function `v4l2_subdev_link_validate_default()` is used instead. This function ensures that width, height and the media bus pixel code are equal on both source and sink of the link. Subdev drivers are also free to use this function to perform the checks mentioned above in addition to their own checks.

There are currently two ways to register subdevices with the V4L2 core. The first (traditional) possibility is to have subdevices registered by bridge drivers. This can be done when the bridge driver has the complete information about subdevices connected to it and knows exactly when to register them. This is typically the case for internal subdevices, like video data processing units within SoCs or complex PCI(e) boards, camera sensors in USB cameras or connected to SoCs, which pass information about them to bridge drivers, usually in their platform data.

There are however also situations where subdevices have to be registered asynchronously to bridge devices. An example of such a configuration is a Device Tree based system where information about subdevices is made available to the system independently from the bridge devices, e.g. when subdevices are defined in DT as I2C device nodes. The API used in this second case is described further below.

Using one or the other registration method only affects the probing process, the run-time bridge-subdevice interaction is in both cases the same.

In the synchronous case a device (bridge) driver needs to register the `v4l2_subdev` with the `v4l2_device`:

```c
v4l2_device_register_subdev(v4l2_dev, sd);
```

This can fail if the subdev module disappeared before it could be registered. After this function was called successfully the subdev->dev field points to the `v4l2_device`.

If the `v4l2_device` parent device has a non-NULL mdev field, the sub-device entity will be automatically registered with the media device.

You can unregister a sub-device using:

```c
v4l2_device_unregister_subdev(sd);
```

Afterwards the subdev module can be unloaded and `sd->dev == NULL`.

You can call an ops function either directly:

```c
err = sd->ops->core->g_std(sd, &norm);
```

but it is better and easier to use this macro:
err = v4l2_subdev_call(sd, core, g_std, &norm);

The macro will to the right NULL pointer checks and returns -ENODEV if sd is NULL, -ENOIOCTLCMD if either sd->core or sd->core->g_std is NULL, or the actual result of the sd->ops->core->g_std ops.

It is also possible to call all or a subset of the sub-devices:

v4l2_device_call_all(v4l2_dev, 0, core, g_std, &norm);

Any subdev that does not support this ops is skipped and error results are ignored. If you want to check for errors use this:

err = v4l2_device_call_until_err(v4l2_dev, 0, core, g_std, &norm);

Any error except -ENOIOCTLCMD will exit the loop with that error. If no errors (except -ENOIOCTLCMD) occurred, then 0 is returned.

The second argument to both calls is a group ID. If 0, then all subdevs are called. If non-zero, then only those whose group ID match that value will be called. Before a bridge driver registers a subdev it can set sd->grp_id to whatever value it wants (it's 0 by default). This value is owned by the bridge driver and the sub-device driver will never modify or use it.

The group ID gives the bridge driver more control how callbacks are called. For example, there may be multiple audio chips on a board, each capable of changing the volume. But usually only one will actually be used when the user want to change the volume. You can set the group ID for that subdev to e.g. AUDIO_CONTROLLER and specify that as the group ID value when calling v4l2_device_call_all(). That ensures that it will only go to the subdev that needs it.

If the sub-device needs to notify its v4l2_device parent of an event, then it can call v4l2_subdev_notify(sd, notification, arg). This macro checks whether there is a notify() callback defined and returns -ENODEV if not. Otherwise the result of the notify() call is returned.

The advantage of using v4l2_subdev is that it is a generic struct and does not contain any knowledge about the underlying hardware. So a driver might contain several subdevs that use an I2C bus, but also a subdev that is controlled through GPIO pins. This distinction is only relevant when setting up the device, but once the subdev is registered it is completely transparent.

In the asynchronous case subdevice probing can be invoked independently of the bridge driver availability. The subdevice driver then has to verify whether all the requirements for a successful probing are satisfied. This can include a check for a master clock availability. If any of the conditions aren’t satisfied the driver might decide to return -EPROBE_DEFER to request further reprobing attempts. Once all conditions are met the subdevice shall be registered using the v4l2_async_register_subdev() function. Unregistration is performed using the v4l2_async_unregister_subdev() call. Subdevices registered this way are stored in a global list of subdevices, ready to be picked up by bridge drivers.

Bridge drivers in turn have to register a notifier object with an array of subdevice descriptors that the bridge device needs for its operation. This is performed using the v4l2_async_notifier_register() call. To unregister the notifier the driver has to call v4l2_async_notifier_unregister(). The former of the two functions takes two arguments: a pointer to struct v4l2_device and a pointer to struct v4l2_async_notifier. The latter contains a pointer to an array of pointers to subdevice descriptors of type struct v4l2_async_subdev type. The V4L2 core will then use these descriptors to match asynchronously registered subdevices to them. If a match is detected the .bound() notifier callback is called. After all subdevices have been located the .complete() callback is called. When a subdevice is removed from the system the .unbind() method is called. All three callbacks are optional.

### 2.1.8 V4L2 sub-device userspace API

Besides exposing a kernel API through the v4l2_subdev_ops structure, V4L2 sub-devices can also be controlled directly by userspace applications.
Device nodes named v4l-subdevX can be created in /dev to access sub-devices directly. If a sub-device supports direct userspace configuration it must set the V4L2_SUBDEV_FL_HAS_DEVNODE flag before being registered.

After registering sub-devices, the v4l2_device driver can create device nodes for all registered sub-devices marked with V4L2_SUBDEV_FL_HAS_DEVNODE by calling v4l2_device_register_subdev_nodes(). Those device nodes will be automatically removed when sub-devices are unregistered.

The device node handles a subset of the V4L2 API.

The controls ioctls are identical to the ones defined in V4L2. They behave identically, with the only exception that they deal only with controls implemented in the sub-device. Depending on the driver, those controls can be also be accessed through one (or several) V4L2 device nodes.

The events ioctls are identical to the ones defined in V4L2. They behave identically, with the only exception that they deal only with events generated by the sub-device. Depending on the driver, those events can also be reported by one (or several) V4L2 device nodes.

Sub-device drivers that want to use events need to set the V4L2_SUBDEV_USES_EVENTS v4l2_subdev.flags and initialize v4l2_subdev.nevents to events queue depth before registering the sub-device. After registration events can be queued as usual on the v4l2_subdev.devnode device node.

To properly support events, the poll() file operation is also implemented.

Private ioctls

All ioctls not in the above list are passed directly to the sub-device driver through the core::ioctl operation.

### 2.1.9 I2C sub-device drivers

Since these drivers are so common, special helper functions are available to ease the use of these drivers (v4l2-common.h).

The recommended method of adding v4l2_subdev support to an I2C driver is to embed the v4l2_subdev struct into the state struct that is created for each I2C device instance. Very simple devices have no state struct and in that case you can just create a v4l2_subdev directly.

A typical state struct would look like this (where ‘chipname’ is replaced by the name of the chip):

```c
struct chipname_state {
    struct v4l2_subdev sd;
    ... /* additional state fields */
};
```

Initialize the v4l2_subdev struct as follows:

```c
v4l2_i2c_subdev_init(&state->sd, client, subdev_ops);
```

This function will fill in all the fields of v4l2_subdev ensure that the v4l2_subdev and i2c_client both point to one another.

You should also add a helper inline function to go from a v4l2_subdev pointer to a chipname_state struct:

```c
static inline struct chipname_state *to_state(struct v4l2_subdev *sd)
{
    return container_of(sd, struct chipname_state, sd);
}
```
Use this to go from the `v4l2_subdev` struct to the `i2c_client` struct:

```c
struct i2c_client *client = v4l2_get_subdevdata(sd);
```

And this to go from an `i2c_client` to a `v4l2_subdev` struct:

```c
struct v4l2_subdev *sd = i2c_get_clientdata(client);
```

Make sure to call `v4l2_device_unregister_subdev()` when the `remove()` callback is called. This will unregister the sub-device from the bridge driver. It is safe to call this even if the sub-device was never registered.

You need to do this because when the bridge driver destroys the i2c adapter the `remove()` callbacks are called of the i2c devices on that adapter. After that the corresponding `v4l2_subdev` structures are invalid, so they have to be unregistered first. Calling `v4l2_device_unregister_subdev()` from the `remove()` callback ensures that this is always done correctly.

The bridge driver also has some helper functions it can use:

```c
struct v4l2_subdev *sd = v4l2_i2c_new_subdev(v4l2_dev, adapter,
                                                "module_foo", "chipid", 0x36, NULL);
```

This loads the given module (can be NULL if no module needs to be loaded) and calls `i2c_new_device()` with the given `i2c_adapter` and chip/address arguments. If all goes well, then it registers the subdev with the `v4l2_device`.

You can also use the last argument of `v4l2_i2c_new_subdev()` to pass an array of possible I2C addresses that it should probe. These probe addresses are only used if the previous argument is 0. A non-zero argument means that you know the exact i2c address so in that case no probing will take place.

Both functions return NULL if something went wrong.

Note that the chipid you pass to `v4l2_i2c_new_subdev()` is usually the same as the module name. It allows you to specify a chip variant, e.g. “saa7114” or “saa7115”. In general though the i2c driver autodetects this. The use of chipid is something that needs to be looked at more closely at a later date. It differs between i2c drivers and as such can be confusing. To see which chip variants are supported you can look in the i2c driver code for the i2c_device_id table. This lists all the possibilities.

There are two more helper functions:

`v4l2_i2c_new_subdev_cfg()`: this function adds new irq and platform_data arguments and has both ‘addr’ and ‘probed_addrs’ arguments: if addr is not 0 then that will be used (non-probing variant), otherwise the probed_addrs are probed.

For example: this will probe for address 0x10:

```c
struct v4l2_subdev *sd = v4l2_i2c_new_subdev_cfg(v4l2_dev, adapter,
                                                 "module_foo", "chipid", 0, NULL, 0, I2C_ADDRS(0x10));
```

`v4l2_i2c_new_subdev_board()` uses an `i2c_board_info` struct which is passed to the i2c driver and replaces the irq, platform_data and addr arguments.

If the subdev supports the s_config core ops, then that op is called with the irq and platform_data arguments after the subdev was setup.

The older `v4l2_i2c_new_subdev()` and `v4l2_i2c_new_probed_subdev()` functions will call s_config as well, but with irq set to 0 and platform_data set to NULL.

### 2.1.10 V4L2 sub-device functions and data structures

**struct v4l2_decode_vbi_line**

_used to decode_vbi_line_

---

620 Chapter 2. Media subsystem kernel internal API
struct v4l2_decode_vbi_line {
    u32 is_second_field;
    u8 * p;
    u32 line;
    u32 type;
};

Members

is_second_field
  • type: u32
    Set to 0 for the first (odd) field; set to 1 for the second (even) field.

p
  • type: u8 *
    Pointer to the sliced VBI data from the decoder. On exit, points to the start of the payload.

line
  • type: u32
    Line number of the sliced VBI data (1-23)

type
  • type: u32
    VBI service type (V4L2_SLICED_*). 0 if no service found

struct v4l2_subdev_io_pin_config
  Subdevice external IO pin configuration

Definition

struct v4l2_subdev_io_pin_config {
    u32 flags;
    u8 pin;
    u8 function;
    u8 value;
    u8 strength;
};

Members

flags
  • type: u32
    bitmask with flags for this pin's config: V4L2_SUBDEV_IO_PIN_DISABLE - disables a pin config, V4L2_SUBDEV_IO_PIN_OUTPUT - if pin is an output, V4L2_SUBDEV_IO_PIN_INPUT - if pin is an input, V4L2_SUBDEV_IO_PIN_SET_VALUE - to set the output value via value and V4L2_SUBDEV_IO_PIN_ACTIVE_LOW - if active is 0.

pin
  • type: u8
    Chip external IO pin to configure

function
  • type: u8
    Internal signal pad/function to route to IO pin

value
• **type**: u8
  Initial value for pin - e.g. GPIO output value

**strength**

• **type**: u8
  Pin drive strength

**struct v4l2_subdev_core_ops**

  Define core ops callbacks for subdevs

**Definition**

```c
struct v4l2_subdev_core_ops {
  int (* log_status) (struct v4l2_subdev *sd);
  int (* s_io_pin_config) (struct v4l2_subdev *sd, size_t n, struct v4l2_subdev_io_pin_config *pincfg);
  int (* init) (struct v4l2_subdev *sd, u32 val);
  int (* load_fw) (struct v4l2_subdev *sd);
  int (* reset) (struct v4l2_subdev *sd, u32 val);
  int (* s_gpio) (struct v4l2_subdev *sd, u32 val);
  long (* ioctl) (struct v4l2_subdev *sd, unsigned int cmd, void *arg);
  #ifdef CONFIG_COMPAT
  long (* compat_ioctl32) (struct v4l2_subdev *sd, unsigned int cmd, unsigned long arg);
  #endif
  #ifdef CONFIG_VIDEO_ADV_DEBUG
  int (* g_register) (struct v4l2_subdev *sd, struct v4l2_dbg_register *reg);
  int (* s_register) (struct v4l2_subdev *sd, const struct v4l2_dbg_register *reg);
  #endif
  int (* s_power) (struct v4l2_subdev *sd, int on);
  int (* interrupt_service_routine) (struct v4l2_subdev *sd, u32 status, bool *handled);
  int (* subscribe_event) (struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub);
  int (* unsubscribe_event) (struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub);
  int (* registered_async) (struct v4l2_subdev *sd);
};
```

**Members**

**log_status**

• **type**: int (*)(struct v4l2_subdev *sd)
  callback for VIDIOC_LOG_STATUS ioctl handler code.

**s_io_pin_config**

• **type**: int (*)(struct v4l2_subdev *sd, size_t n, struct v4l2_subdev_io_pin_config *pincfg)
  configure one or more chip I/O pins for chips that multiplex different internal signal pads out to IO pins. This function takes a pointer to an array of ‘n’ pin configuration entries, one for each pin being configured. This function could be called at times other than just subdevice initialization.

**init**

• **type**: int (*)(struct v4l2_subdev *sd, u32 val)
  initialize the sensor registers to some sort of reasonable default values. Do not use for new drivers and should be removed in existing drivers.

**load_fw**

• **type**: int (*)(struct v4l2_subdev *sd)
  load firmware.
reset
  • type: int (*)(struct v4l2_subdev *sd, u32 val)

  generic reset command. The argument selects which subsystems to reset. Passing 0 will always
  reset the whole chip. Do not use for new drivers without discussing this first on the linux-media
  mailinglist. There should be no reason normally to reset a device.

s_gpio
  • type: int (*)(struct v4l2_subdev *sd, u32 val)

  set GPIO pins. Very simple right now, might need to be extended with a direction argument if needed.

ioctl
  • type: long (*)(struct v4l2_subdev *sd, unsigned int cmd, void *arg)

  called at the end of ioctl() syscall handler at the V4L2 core. used to provide support for private
  ioctl's used on the driver.

compat_ioctl32
  • type: long (*)(struct v4l2_subdev *sd, unsigned int cmd, unsigned long arg)

  called when a 32 bits application uses a 64 bits Kernel, in order to fix data passed from/to userspace.

g_register
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_dbg_register *reg)

  callback for VIDIOC_G_REGISTER ioctl handler code.

s_register
  • type: int (*)(struct v4l2_subdev *sd, const struct v4l2_dbg_register *reg)

  callback for VIDIOC_G_REGISTER ioctl handler code.

s_power
  • type: int (*)(struct v4l2_subdev *sd, int on)

  puts subdevice in power saving mode (on == 0) or normal operation mode (on == 1).

interrupt_service_routine
  • type: int (*)(struct v4l2_subdev *sd, u32 status, bool *handled)

  Called by the bridge chip's interrupt service handler, when an interrupt status has be raised due to
  this subdev, so that this subdev can handle the details. It may schedule work to be performed later.
  It must not sleep. Called from an IRQ context.

subscribe_event
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub)

  used by the drivers to request the control framework that for it to be warned when the value of a
  control changes.

unsubscribe_event
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub)

  remove event subscription from the control framework.

registered_async
  • type: int (*)(struct v4l2_subdev *sd)

  the subdevice has been registered async.
struct v4l2_subdev_tuner_ops

Callbacks used when v4l device was opened in radio mode.

Definition

```c
struct v4l2_subdev_tuner_ops {
    int (* s_radio) (struct v4l2_subdev *sd);
    int (* s_frequency) (struct v4l2_subdev *sd, const struct v4l2_frequency *freq);
    int (* g_frequency) (struct v4l2_subdev *sd, struct v4l2_frequency *freq);
    int (* enum_freq_bands) (struct v4l2_subdev *sd, struct v4l2_frequency_band *band);
    int (* s_tuner) (struct v4l2_subdev *sd, const struct v4l2_tuner *vt);
    int (* g_tuner) (struct v4l2_subdev *sd, const struct v4l2_tuner *vt);
    int (* s_modulator) (struct v4l2_subdev *sd, const struct v4l2_modulator *vm);
    int (* g_modulator) (struct v4l2_subdev *sd, struct v4l2_modulator *vm);
    int (* s_type_addr) (struct v4l2_subdev *sd, struct tuner_setup *type);
    int (* s_config) (struct v4l2_subdev *sd, const struct v4l2_priv_tun_config *config);
};
```

Members

**s_radio**

- **type:** int (*) (struct v4l2_subdev *sd)
  
  Callback for VIDIOC_S_RADIO ioctl handler code.

**s_frequency**

- **type:** int (*) (struct v4l2_subdev *sd, const struct v4l2_frequency *freq)
  
  Callback for VIDIOC_S_FREQUENCY ioctl handler code.

**g_frequency**

- **type:** int (*) (struct v4l2_subdev *sd, struct v4l2_frequency *freq)
  
  Callback for VIDIOC_G_FREQUENCY ioctl handler code. freq->type must be filled in. Normally done by video_ioctl2() or the bridge driver.

**enum_freq_bands**

- **type:** int (*) (struct v4l2_subdev *sd, struct v4l2_frequency_band *band)
  
  Callback for VIDIOC_ENUM_FREQ_BANDS ioctl handler code.

**g_tuner**

- **type:** int (*) (struct v4l2_subdev *sd, struct v4l2_tuner *vt)
  
  Callback for VIDIOC_G_TUNER ioctl handler code.

**s_tuner**

- **type:** int (*) (struct v4l2_subdev *sd, const struct v4l2_tuner *vt)
  
  Callback for VIDIOC_S_TUNER ioctl handler code. vt->type must be filled in. Normally done by video_ioctl2 or the bridge driver.

**g_modulator**

- **type:** int (*) (struct v4l2_subdev *sd, struct v4l2_modulator *vm)
  
  Callback for VIDIOC_G_MODULATOR ioctl handler code.

**s_modulator**

- **type:** int (*) (struct v4l2_subdev *sd, const struct v4l2_modulator *vm)
  
  Callback for VIDIOC_S_MODULATOR ioctl handler code.

**s_type_addr**

- **type:** int (*) (struct v4l2_subdev *sd, struct tuner_setup *type)
sets tuner type and its I2C addr.

**s_config**

- **type**: int (*)(struct v4l2_subdev *sd, const struct v4l2_priv_tun_config *config)
  
sets tda9887 specific stuff, like port1, port2 and qss

**struct v4l2_subdev_audio_ops**

Callbacks used for audio-related settings

**Definition**

```c
struct v4l2_subdev_audio_ops {
    int (* s_clock_freq) (struct v4l2_subdev *sd, u32 freq);
    int (* s_i2s_clock_freq) (struct v4l2_subdev *sd, u32 freq);
    int (* s_routing) (struct v4l2_subdev *sd, u32 input, u32 output, u32 config);
    int (* s_stream) (struct v4l2_subdev *sd, int enable);
};
```

**Members**

- **s_clock_freq**
  
```c
    int (*)(struct v4l2_subdev *sd, u32 freq)
  ``

set the frequency (in Hz) of the audio clock output. Used to slave an audio processor to the video decoder, ensuring that audio and video remain synchronized. Usual values for the frequency are 48000, 44100 or 32000 Hz. If the frequency is not supported, then -EINVAL is returned.

- **s_i2s_clock_freq**
  
```c
    int (*)(struct v4l2_subdev *sd, u32 freq)
  ``

sets I2S speed in bps. This is used to provide a standard way to select I2S clock used by driving digital audio streams at some board designs. Usual values for the frequency are 1024000 and 2048000. If the frequency is not supported, then -EINVAL is returned.

- **s_routing**
  
```c
    int (*)(struct v4l2_subdev *sd, u32 input, u32 output, u32 config)
  ``

used to define the input and/or output pins of an audio chip, and any additional configuration data. Never attempt to use user-level input IDs (e.g. Composite, S-Video, Tuner) at this level. An i2c device shouldn’t know about whether an input pin is connected to a Composite connector, become on another board or platform it might be connected to something else entirely. The calling driver is responsible for mapping a user-level input to the right pins on the i2c device.

- **s_stream**
  
```c
    int (*)(struct v4l2_subdev *sd, int enable)
  ``

used to notify the audio code that stream will start or has stopped.

**struct v4l2_mbus_frame_desc_entry**

media bus frame description structure

**Definition**

```c
struct v4l2_mbus_frame_desc_entry {
    u16 flags;
    u32 pixelcode;
    u32 length;
};
```

**Members**

- **flags**

```c
    u16
  ``

2.1. Video2Linux devices
bitmask flags: V4L2_MBUS_FRAME_DESC_FL_LEN_MAX and V4L2_MBUS_FRAME_DESC_FL_BLOB.

**Pixelcode**

- **type**: u32
  
  media bus pixel code, valid if FRAME_DESC_FL_BLOB is not set

**Length**

- **type**: u32
  
  number of octets per frame, valid if V4L2_MBUS_FRAME_DESC_FL_BLOB is set

**struct v4l2_mbus_frame_desc**

media bus data frame description

**Definition**

```c
struct v4l2_mbus_frame_desc {
    struct v4l2_mbus_frame_desc_entry entry[V4L2_FRAME_DESC_ENTRY_MAX];
    unsigned short num_entries;
};
```

**Members**

**entry[V4L2_FRAME_DESC_ENTRY_MAX]**

- **type**: struct v4l2_mbus_frame_desc_entry

  frame descriptors array

**num_entries**

- **type**: unsigned short

  number of entries in **entry** array

**struct v4l2_subdev_video_ops**

Callbacks used when v4l device was opened in video mode.

**Definition**

```c
struct v4l2_subdev_video_ops {
    int (* s_routing) (struct v4l2_subdev *sd, u32 input, u32 output, u32 config);
    int (* s_crystal_freq) (struct v4l2_subdev *sd, u32 freq, u32 flags);
    int (* g_std) (struct v4l2_subdev *sd, v4l2_std_id *norm);
    int (* s_std) (struct v4l2_subdev *sd, v4l2_std_id norm);
    int (* s_std_output) (struct v4l2_subdev *sd, v4l2_std_id std);
    int (* g_std_output) (struct v4l2_subdev *sd, v4l2_std_id *std);
    int (* querystd) (struct v4l2_subdev *sd, v4l2_std_id *std);
    int (* g_tvnorms) (struct v4l2_subdev *sd, v4l2_std_id *std);
    int (* g_tvnorms_output) (struct v4l2_subdev *sd, v4l2_std_id *std);
    int (* g_input_status) (struct v4l2_subdev *sd, u32 *status);
    int (* s_stream) (struct v4l2_subdev *sd, int enable);
    int (* cropcap) (struct v4l2_subdev *sd, struct v4l2_cropcap *cc);
    int (* g_crop) (struct v4l2_subdev *sd, struct v4l2_crop *crop);
    int (* s_crop) (struct v4l2_subdev *sd, const struct v4l2_crop *crop);
    int (* g_parm) (struct v4l2_subdev *sd, struct v4l2_streamparm *param);
    int (* s_parm) (struct v4l2_subdev *sd, struct v4l2_streamparm *param);
    int (* g_frame_interval) (struct v4l2_subdev *sd,struct v4l2_subdev_frame_interval *interval);
    int (* s_frame_interval) (struct v4l2_subdev *sd,struct v4l2_subdev_frame_interval *interval);
    int (* s_dv_timings) (struct v4l2_subdev *sd,struct v4l2_dv_timings *timings);
    int (* g_dv_timings) (struct v4l2_subdev *sd,struct v4l2_dv_timings *timings);
    int (* query dv timings) (struct v4l2_subdev *sd,struct v4l2_dv_timings *timings);
    int (* g_mbus_config) (struct v4l2_subdev *sd,struct v4l2_mbus_config *cfg);
    int (* s_mbus_config) (struct v4l2_subdev *sd,struct v4l2_mbus_config *cfg);
    int (* s_rx_buffer) (struct v4l2_subdev *sd, void *buf,unsigned int *size);
};
```
Members

s_routing

- **type**: `int (*)(struct v4l2_subdev *sd, u32 input, u32 output, u32 config)`
  
  See s_routing in audio_ops, except this version is for video devices.

s_crystal_freq

- **type**: `int (*)(struct v4l2_subdev *sd, u32 freq, u32 flags)`
  
  Sets the frequency of the crystal used to generate the clocks in Hz. An extra flags field allows device specific configuration regarding clock frequency dividers, etc. If not used, then set flags to 0. If the frequency is not supported, then -EINVAL is returned.

g_std

- **type**: `int (*)(struct v4l2_subdev *sd, v4l2_std_id *norm)`
  
  Callback for VIDIOC_G_STD ioctl handler code.

g_std_output

- **type**: `int (*)(struct v4l2_subdev *sd, v4l2_std_id std)`
  
  Set `v4l2_std_id` for video OUTPUT devices. This is ignored by video input devices.

g_std_output

- **type**: `int (*)(struct v4l2_subdev *sd, v4l2_std_id *std)`
  
  Get current standard for video OUTPUT devices. This is ignored by video input devices.

querystd

- **type**: `int (*)(struct v4l2_subdev *sd, v4l2_std_id *std)`
  
  Callback for VIDIOC_QUERYSTD ioctl handler code.

g_tvnorms

- **type**: `int (*)(struct v4l2_subdev *sd, v4l2_std_id *std)`
  
  Get `v4l2_std_id` with all standards supported by the video CAPTURE device. This is ignored by video output devices.

g_tvnorms_output

- **type**: `int (*)(struct v4l2_subdev *sd, v4l2_std_id *std)`
  
  Get `v4l2_std_id` with all standards supported by the video OUTPUT device. This is ignored by video capture devices.

g_input_status

- **type**: `int (*)(struct v4l2_subdev *sd, u32 *status)`
  
  Get input status. Same as the status field in the struct v4l2_input

s_stream

- **type**: `int (*)(struct v4l2_subdev *sd, int enable)`
  
  Used to notify the driver that a video stream will start or has stopped.

cropcap

- **type**: `int (*)(struct v4l2_subdev *sd, struct v4l2_cropcap *cc)`

2.1. Video2Linux devices
callback for VIDIOC_CROPCAP ioctl handler code.

**g_crop**

- **type**: int (*)(struct v4l2_subdev *sd, struct v4l2_crop *crop)

callback for VIDIOC_G_CROP ioctl handler code.

**s_crop**

- **type**: int (*)(struct v4l2_subdev *sd, const struct v4l2_crop *crop)

callback for VIDIOC_S_CROP ioctl handler code.

**g_parm**

- **type**: int (*)(struct v4l2_subdev *sd, struct v4l2_streamparm *param)

callback for VIDIOC_G_PARM ioctl handler code.

**s_parm**

- **type**: int (*)(struct v4l2_subdev *sd, struct v4l2_streamparm *param)

callback for VIDIOC_S_PARM ioctl handler code.

**g_frame_interval**

- **type**: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_frame_interval *interval)

callback for VIDIOC_G_FRAMEINTERVAL ioctl handler code.

**s_frame_interval**

- **type**: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_frame_interval *interval)

callback for VIDIOC_S_FRAMEINTERVAL ioctl handler code.

**s_dv_timings**

- **type**: int (*)(struct v4l2_subdev *sd, struct v4l2_dv_timings *timings)

Set custom dv timings in the sub device. This is used when sub device is capable of setting detailed timing information in the hardware to generate/detect the video signal.

**g_dv_timings**

- **type**: int (*)(struct v4l2_subdev *sd, struct v4l2_dv_timings *timings)

Get custom dv timings in the sub device.

**query_dv_timings**

- **type**: int (*)(struct v4l2_subdev *sd, struct v4l2_dv_timings *timings)

callback for VIDIOC_QUERY_DV_TIMINGS ioctl handler code.

**g_mbus_config**

- **type**: int (*)(struct v4l2_subdev *sd, struct v4l2_mbus_config *cfg)

get supported mediabus configurations

**s_mbus_config**

- **type**: int (*)(struct v4l2_subdev *sd, const struct v4l2_mbus_config *cfg)

set a certain mediabus configuration. This operation is added for compatibility with soc-camera drivers and should not be used by new software.

**s_rx_buffer**

- **type**: int (*)(struct v4l2_subdev *sd, void *buf, unsigned int *size)
set a host allocated memory buffer for the subdev. The subdev can adjust \texttt{size} to a lower value and must not write more data to the buffer starting at \texttt{data} than the original value of \texttt{size}.

\textbf{struct v4l2_subdev_vbi_ops}

Callbacks used when v4l device was opened in video mode via the vbi device node.

\begin{verbatim}
struct v4l2_subdev_vbi_ops {
    int (* decode_vbi_line) (struct v4l2_subdev *sd, struct v4l2_decode_vbi_line *vbi_line);
    int (* s_vbi_data) (struct v4l2_subdev *sd, const struct v4l2_sliced_vbi_data *vbi_data);
    int (* g_vbi_data) (struct v4l2_subdev *sd, struct v4l2_sliced_vbi_data *vbi_data);
    int (* g_sliced_vbi_cap) (struct v4l2_subdev *sd, struct v4l2_sliced_vbi_cap *cap);
    int (* s_raw_fmt) (struct v4l2_subdev *sd, struct v4l2_vbi_format *fmt);
    int (* g_sliced_fmt) (struct v4l2_subdev *sd, struct v4l2_sliced_vbi_format *fmt);
    int (* s_sliced_fmt) (struct v4l2_subdev *sd, struct v4l2_sliced_vbi_format *fmt);
};
\end{verbatim}

\textbf{Members}

\textbf{decode_vbi_line}

- \textbf{type}: int (*)(struct v4l2_subdev *sd, struct v4l2_decode_vbi_line *vbi_line)

video decoders that support sliced VBI need to implement this ioctl. Field \texttt{p} of the struct \texttt{v4l2_sliced_vbi_line} is set to the start of the VBI data that was generated by the decoder. The driver then parses the sliced VBI data and sets the other fields in the struct accordingly. The pointer \texttt{p} is updated to point to the start of the payload which can be copied verbatim into the data field of the struct \texttt{v4l2_sliced_vbi_data}. If no valid VBI data was found, then the type field is set to 0 on return.

\textbf{s_vbi_data}

- \textbf{type}: int (*)(struct v4l2_subdev *sd, const struct v4l2_sliced_vbi_data *vbi_data)

used to generate VBI signals on a video signal. struct \texttt{v4l2_sliced_vbi_data} is filled with the data packets that should be output. Note that if you set the line field to 0, then that VBI signal is disabled. If no valid VBI data was found, then the type field is set to 0 on return.

\textbf{g_vbi_data}

- \textbf{type}: int (*)(struct v4l2_subdev *sd, struct v4l2_sliced_vbi_data *vbi_data)

used to obtain the sliced VBI packet from a readback register. Not all video decoders support this. If no data is available because the readback register contains invalid or erroneous data - EIO is returned. Note that you must fill in the ‘id’ member and the ‘field’ member (to determine whether CC data from the first or second field should be obtained).

\textbf{g_sliced_vbi_cap}

- \textbf{type}: int (*)(struct v4l2_subdev *sd, struct v4l2_sliced_vbi_cap *cap)

callback for VIDIOC_SLICED_VBI_CAP ioctl handler code.

\textbf{s_raw_fmt}

- \textbf{type}: int (*)(struct v4l2_subdev *sd, struct v4l2_vbi_format *fmt)

setup the video encoder/decoder for raw VBI.

\textbf{g_sliced_fmt}

- \textbf{type}: int (*)(struct v4l2_subdev *sd, struct v4l2_sliced_vbi_format *fmt)

retrieve the current sliced VBI settings.

\textbf{s_sliced_fmt}

- \textbf{type}: int (*)(struct v4l2_subdev *sd, struct v4l2_sliced_vbi_format *fmt)
setup the sliced VBI settings.

```c
struct v4l2_subdev_sensor_ops
  v4l2-subdev sensor operations

Definition

```c
struct v4l2_subdev_sensor_ops {
  int (*g_skip_top_lines)(struct v4l2_subdev *sd, u32 *lines);
  int (*g_skip_frames)(struct v4l2_subdev *sd, u32 *frames);
};
```

Members

g_skip_top_lines
  - **type**: int (*)(struct v4l2_subdev *sd,u32 *lines)
  - number of lines at the top of the image to be skipped. This is needed for some sensors, which always corrupt several top lines of the output image, or which send their metadata in them.

g_skip_frames
  - **type**: int (*)(struct v4l2_subdev *sd,u32 *frames)
  - number of frames to skip at stream start. This is needed for buggy sensors that generate faulty frames when they are turned on.

e num v4l2_subdev_ir_mode
  - describes the type of IR supported

Constants

V4L2_SUBDEV_IR_MODE_PULSE_WIDTH  IR uses struct ir_raw_event records

```c
struct v4l2_subdev_ir_parameters
  Parameters for IR TX or RX

Definition

```c
struct v4l2_subdev_ir_parameters {
  unsigned int bytes_per_data_element;
  enum v4l2_subdev_ir_mode mode;
  bool enable;
  bool interrupt_enable;
  bool shutdown;
  bool modulation;
  u32 max_pulse_width;
  unsigned int carrier_freq;
  unsigned int duty_cycle;
  bool invert_level;
  bool invert_carrier_sense;
  u32 noise_filter_min_width;
  unsigned int carrier_range_lower;
  unsigned int carrier_range_upper;
  u32 resolution;
};
```

Members

bytes_per_data_element
  - **type**: unsigned int
  - bytes per data element of data in read or write call.

mode
  - **type**: enum v4l2_subdev_ir_mode
IR mode as defined by `enum v4l2_subdev_ir_mode`.

**enable**
- **type**: bool
  - device is active if true

**interrupt_enable**
- **type**: bool
  - IR interrupts are enabled if true

**shutdown**
- **type**: bool
  - if true: set hardware to low/no power, false: normal mode

**modulation**
- **type**: bool
  - if true, it uses carrier, if false: baseband

**max_pulse_width**
- **type**: u32
  - maximum pulse width in ns, valid only for baseband signal

**carrier_freq**
- **type**: unsigned int
  - carrier frequency in Hz, valid only for modulated signal

**duty_cycle**
- **type**: unsigned int
  - duty cycle percentage, valid only for modulated signal

**invert_level**
- **type**: bool
  - invert signal level

**invert_carriersense**
- **type**: bool
  - Send 0/space as a carrier burst. used only in TX.

**noise_filter_min_width**
- **type**: u32
  - min time of a valid pulse, in ns. Used only for RX.

**carrier_range_lower**
- **type**: unsigned int
  - Lower carrier range, in Hz, valid only for modulated signal. Used only for RX.

**carrier_range_upper**
- **type**: unsigned int
  - Upper carrier range, in Hz, valid only for modulated signal. Used only for RX.

**resolution**
- **type**: u32
The receive resolution, in ns. Used only for RX.

```c
struct v4l2_subdev_ir_ops
    operations for IR subdevices

Definition

```struct v4l2_subdev_ir_ops {
    int (* rx_read) (struct v4l2_subdev *sd, u8 *buf, size_t count, ssize_t *num);
    int (* rx_g_parameters) (struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *params);
    int (* rx_s_parameters) (struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *params);
    int (* tx_write) (struct v4l2_subdev *sd, u8 *buf, size_t count, ssize_t *num);
    int (* tx_g_parameters) (struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *params);
    int (* tx_s_parameters) (struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *params);
};
```

Members

**rx_read**

- **type:** int (*)(struct v4l2_subdev *sd, u8 *buf, size_t count, ssize_t *num)
  
  Reads received codes or pulse width data. The semantics are similar to a non-blocking `read()` call.

**rx_g_parameters**

- **type:** int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *params)
  
  Get the current operating parameters and state of the IR receiver.

**rx_s_parameters**

- **type:** int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *params)
  
  Set the current operating parameters and state of the IR receiver. It is recommended to call `rx_g_parameters` first to fill out the current state, and only change the fields that need to be changed. Upon return, the actual device operating parameters and state will be returned. Note that hardware limitations may prevent the actual settings from matching the requested settings - e.g. an actual carrier setting of 35,904 Hz when 36,000 Hz was requested. An exception is when the shutdown parameter is true. The last used operational parameters will be returned, but the actual state of the hardware be different to minimize power consumption and processing when shutdown is true.

**tx_write**

- **type:** int (*)(struct v4l2_subdev *sd, u8 *buf, size_t count, ssize_t *num)
  
  Writes codes or pulse width data for transmission. The semantics are similar to a non-blocking `write()` call.

**tx_g_parameters**

- **type:** int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *params)
  
  Get the current operating parameters and state of the IR transmitter.

**tx_s_parameters**

- **type:** int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_ir_parameters *params)
  
  Set the current operating parameters and state of the IR transmitter. It is recommended to call `tx_g_parameters` first to fill out the current state, and only change the fields that need to be changed. Upon return, the actual device operating parameters and state will be returned. Note that hardware limitations may prevent the actual settings from matching the requested settings - e.g. an actual carrier setting of 35,904 Hz when 36,000 Hz was requested. An exception is when the shutdown parameter is true. The last used operational parameters will be returned, but the actual state of the hardware be different to minimize power consumption and processing when shutdown is true.
struct v4l2_subdev_pad_config
    Used for storing subdev pad information.

Definition

```c
struct v4l2_subdev_pad_config {
    struct v4l2_mbus_framefmt try_fmt;
    struct v4l2_rect try_crop;
    struct v4l2_rect try_compose;
};
```

Members

try_fmt
    • type: struct v4l2_mbus_framefmt
        pointer to struct v4l2_mbus_framefmt

try_crop
    • type: struct v4l2_rect
        pointer to struct v4l2_rect to be used for crop

try_compose
    • type: struct v4l2_rect
        pointer to struct v4l2_rect to be used for compose

Description

This structure only needs to be passed to the pad op if the ‘which’ field of the main argument is set to
V4L2_SUBDEV_FORMAT_TRY. For V4L2_SUBDEV_FORMAT_ACTIVE it is safe to pass NULL.

struct v4l2_subdev_pad_ops
    v4l2-subdev pad level operations

Definition

```c
struct v4l2_subdev_pad_ops {
    int (* init_cfg) (struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg);

    int (* get_selection) (struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg, struct v4l2_
        ...subdev_selection *sel);
    int (* set_selection) (struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg, struct v4l2_
        ...subdev_selection *sel);
    int (* get_edid) (struct v4l2_subdev *sd, struct v4l2_edid *edid);
    int (* set_edid) (struct v4l2_subdev *sd, struct v4l2_edid *edid);
    int (* enum_dv_timings) (struct v4l2_subdev *sd, struct v4l2_dv_timings_cap *cap);
    int (* get_dv_timings) (struct v4l2_subdev *sd, struct v4l2_enum_dv_timings *timings);
    #ifdef CONFIG_MEDIA_CONTROLLER
    int (* link_validate) (struct v4l2_subdev *sd, struct media_link *link, struct v4l2_subdev_
        ...format *source_fmt, struct v4l2_subdev_format *sink_fmt);
    #endif
    int (* get_frame_desc) (struct v4l2_subdev *sd, unsigned int pad, struct v4l2_mbus_frame_desc_
        ...*fd);
};
```
int (* set_frame_desc) (struct v4l2_subdev *sd, unsigned int pad, struct v4l2_mbus_frame_desc *fd);
}

Members

init_cfg
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg)
  initialize the pad config to default values

callback for VIDIOC_SUBDEV_ENUM_MBUS_CODE ioctl handler code.

enum_mbus_code
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg, struct v4l2_subdev_mbus_code_enum *code)

callback for VIDIOC_SUBDEV_ENUM_MBUS_CODE ioctl handler code.

callback for VIDIOC_SUBDEV_ENUM_MBUS_CODE ioctl handler code.

enum_frame_size
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg, struct v4l2_subdev_frame_size_enum *fse)

callback for VIDIOC_SUBDEV_ENUM_FRAME_SIZE ioctl handler code.

callback for VIDIOC_SUBDEV_ENUM_FRAME_SIZE ioctl handler code.

enum_frame_interval
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg, struct v4l2_subdev_frame_interval_enum *fie)

callback for VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL ioctl handler code.

callback for VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL ioctl handler code.

callback for VIDIOC_SUBDEV_ENUM_FRAME_INTERVAL ioctl handler code.

get_fmt
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg, struct v4l2_subdev_format *format)

callback for VIDIOC_SUBDEV_G_FMT ioctl handler code.

callback for VIDIOC_SUBDEV_G_FMT ioctl handler code.

set_fmt
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg, struct v4l2_subdev_format *format)

callback for VIDIOC_SUBDEV_S_FMT ioctl handler code.

callback for VIDIOC_SUBDEV_S_FMT ioctl handler code.

get_selection
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg, struct v4l2_subdev_selection *sel)

callback for VIDIOC_SUBDEV_G_SELECTION ioctl handler code.

callback for VIDIOC_SUBDEV_G_SELECTION ioctl handler code.

set_selection
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_pad_config *cfg, struct v4l2_subdev_selection *sel)

callback for VIDIOC_SUBDEV_S_SELECTION ioctl handler code.

callback for VIDIOC_SUBDEV_S_SELECTION ioctl handler code.

callback for VIDIOC_SUBDEV_G_SELECTION ioctl handler code.

get_edid
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_edid *edid)

callback for VIDIOC_SUBDEV_G_EDID ioctl handler code.

set_edid
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_edid *edid)

callback for VIDIOC_SUBDEV_S_EDID ioctl handler code.
dv_timings_cap
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_dv_timings_cap *cap)
    callback for VIDIOC_SUBDEV_DV_TIMINGS_CAP ioctl handler code.

enum_dv_timings
  • type: int (*)(struct v4l2_subdev *sd, struct v4l2_enum_dv_timings *timings)
    callback for VIDIOC_SUBDEV_ENUM_DV_TIMINGS ioctl handler code.

link_validate
  • type: int (*)(struct v4l2_subdev *sd, struct media_link *link, struct v4l2_subdev_format *source_fmt, struct v4l2_subdev_format *sink_fmt)
    used by the media controller code to check if the links that belongs to a pipeline can be used for stream.

get_frame_desc
  • type: int (*)(struct v4l2_subdev *sd, unsigned int pad, struct v4l2_mbus_frame_desc *fd)
    get the current low level media bus frame parameters.

set_frame_desc
  • type: int (*)(struct v4l2_subdev *sd, unsigned int pad, struct v4l2_mbus_frame_desc *fd)
    set the low level media bus frame parameters, fd array may be adjusted by the subdev driver to device capabilities.

struct v4l2_subdev_ops
  Subdev operations

Definition

struct v4l2_subdev_ops {
  const struct v4l2_subdev_core_ops * core;
  const struct v4l2_subdev_tuner_ops * tuner;

  const struct v4l2_subdev_vbi_ops * vbi;
  const struct v4l2_subdev_ir_ops * ir;
  const struct v4l2_subdev_sensor_ops * sensor;
  const struct v4l2_subdev_pad_ops * pad;
};

Members

core
  • type: const struct v4l2_subdev_core_ops *
    pointer to struct v4l2_subdev_core_ops. Can be NULL

tuner
  • type: const struct v4l2_subdev_tuner_ops *
    pointer to struct v4l2_subdev_tuner_ops. Can be NULL

audio
  • type: const struct v4l2_subdev_audio_ops *
    pointer to struct v4l2_subdev_audio_ops. Can be NULL

video

2.1. Video2Linux devices
• **type**: `const struct v4l2_subdev_video_ops *`  
  pointer to `struct v4l2_subdev_video_ops`. Can be NULL

**vbi**
  • **type**: `const struct v4l2_subdev_vbi_ops *`  
  pointer to `struct v4l2_subdev_vbi_ops`. Can be NULL

**ir**
  • **type**: `const struct v4l2_subdev_ir_ops *`  
  pointer to `struct v4l2_subdev_ir_ops`. Can be NULL

**sensor**
  • **type**: `const struct v4l2_subdev_sensor_ops *`  
  pointer to `struct v4l2_subdev_sensor_ops`. Can be NULL

**pad**
  • **type**: `const struct v4l2_subdev_pad_ops *`  
  pointer to `struct v4l2_subdev_pad_ops`. Can be NULL

**struct v4l2_subdev_internal_ops**

  V4L2 subdev internal ops

**Definition**

```c
struct v4l2_subdev_internal_ops {
    int (* registered) (struct v4l2_subdev *sd);
    void (* unregistered) (struct v4l2_subdev *sd);
    int (* open) (struct v4l2_subdev *sd, struct v4l2_subdev_fh *fh);
    int (* close) (struct v4l2_subdev *sd, struct v4l2_subdev_fh *fh);
};
```

**Members**

**registered**

  • **type**: `int (*)(struct v4l2_subdev *sd)`  
  called when this subdev is registered. When called the v4l2_device field is set to the correct v4l2_device.

**unregistered**

  • **type**: `void (*)(struct v4l2_subdev *sd)`  
  called when this subdev is unregistered. When called the v4l2_device field is still set to the correct v4l2_device.

**open**

  • **type**: `int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_fh *fh)`  
  called when the subdev device node is opened by an application.

**close**

  • **type**: `int (*)(struct v4l2_subdev *sd, struct v4l2_subdev_fh *fh)`  
  called when the subdev device node is closed.

**Description**
**Note:**

Never call this from drivers, only the v4l2 framework can call these ops.

```c
struct v4l2_subdev_platform_data
    regulators config struct

Definition
```

```c
struct v4l2_subdev_platform_data {
    struct regulator_bulk_data * regulators;
    int num_regulators;
    void * host_priv;
};
```

Members

**regulators**

- **type:** struct regulator_bulk_data *
  - Optional regulators used to power on/off the subdevice

**num_regulators**

- **type:** int
  - Number of regulators

**host_priv**

- **type:** void *
  - Per-subdevice data, specific for a certain video host device

```c
struct v4l2_subdev
    describes a V4L2 sub-device

Definition
```

```c
struct v4l2_subdev {
    #if defined(CONFIG_MEDIA_CONTROLLER)
        struct media_entity entity;
    #endif
    struct list_head list;
    struct module * owner;
    bool owner_v4l2_dev;
    u32 flags;
    struct v4l2_device * v4l2_dev;
    const struct v4l2_subdev_ops * ops;
    const struct v4l2_subdev_internal_ops * internal_ops;
    struct v4l2_ctrl_handler * ctrl_handler;
    char name[V4L2_SUBDEV_NAME_SIZE];
    u32 grp_id;
    void * dev_priv;
    void * host_priv;
    struct video_device * devnode;
    struct device * dev;
    struct device_node * of_node;
    struct list_head async_list;
    struct v4l2_async_subdev * asd;
    struct v4l2_async_notifier * notifier;
    struct v4l2_subdev_platform_data * pdata;
};
```
Members

entity
  • **type**: struct media_entity
    pointer to *struct media_entity*

list
  • **type**: struct list_head
    List of sub-devices

owner
  • **type**: struct module *
    The owner is the same as the driver’s struct device owner.

owner_v4l2_dev
  • **type**: bool
    true if the sd->owner matches the owner of v4l2_dev->dev owner. Initialized by v4l2_device_register_subdev().

flags
  • **type**: u32
    subdev flags. Can be: V4L2_SUBDEV_FL_IS_I2C - Set this flag if this subdev is an i2c device; V4L2_SUBDEV_FL_IS_SPI - Set this flag if this subdev is a spi device; V4L2_SUBDEV_FL_HAS_DEVNODE - Set this flag if this subdev needs a device node; V4L2_SUBDEV_FL_HAS_EVENTS - Set this flag if this subdev generates events.

v4l2_dev
  • **type**: struct v4l2_device *
    pointer to *struct v4l2_device*

ops
  • **type**: const struct v4l2_subdev_ops *
    pointer to *struct v4l2_subdev_ops*

internal_ops
  • **type**: const struct v4l2_subdev_internal_ops *
    pointer to *struct v4l2_subdev_internal_ops*. Never call these internal ops from within a driver!

ctrl_handler
  • **type**: struct v4l2_ctrl_handler *
    The control handler of this subdev. May be NULL.

name[V4L2_SUBDEV_NAME_SIZE]
  • **type**: char
    Name of the sub-device. Please notice that the name must be unique.

grp_id
  • **type**: u32
    can be used to group similar subdevs. Value is driver-specific

dev_priv
  • **type**: void *
pointer to private data

host_priv
  • **type**: `void *`
  pointer to private data used by the device where the subdev is attached.

devnode
  • **type**: `struct video_device *`
  subdev device node

dev
  • **type**: `struct device *`
  pointer to the physical device, if any

of_node
  • **type**: `struct device_node *`
  The device_node of the subdev, usually the same as `dev->of_node`.

async_list
  • **type**: `struct list_head`
  Links this subdev to a global subdev_list or `notifier`->done list.

asd
  • **type**: `struct v4l2_async_subdev *`
  Pointer to respective `struct v4l2_async_subdev`.

notifier
  • **type**: `struct v4l2_async_notifier *`
  Pointer to the managing notifier.

pdata
  • **type**: `struct v4l2_subdev_platform_data *`
  common part of subdevice platform data

**Description**

Each instance of a subdev driver should create this struct, either stand-alone or embedded in a larger struct.

This structure should be initialized by `v4l2_subdev_init()` or one of its variants: `v4l2_spi_subdev_init()`, `v4l2_i2c_subdev_init()`.

**struct v4l2_subdev_fh**
  Used for storing subdev information per file handle

**Definition**

```c
struct v4l2_subdev_fh {
  struct v4l2_fh vfh;
  #if defined(CONFIG_VIDEO_V4L2_SUBDEV_API)
    struct v4l2_subdev_pad_config * pad;
  #endif
};
```

**Members**

- `vfh`
• **type**: struct v4l2_fh
  pointer to struct v4l2_fh

**pad**
  
• **type**: struct v4l2_subdev_pad_config *
  pointer to v4l2_subdev_pad_config

```c
void v4l2_set_subdevdata(struct v4l2_subdev * sd, void * p)
```
Sets V4L2 dev private device data

**Parameters**

struct v4l2_subdev * sd pointer to struct v4l2_subdev
void * p pointer to the private device data to be stored.

```c
void * v4l2_get_subdevdata(const struct v4l2_subdev * sd)
```
Gets V4L2 dev private device data

**Parameters**

const struct v4l2_subdev * sd pointer to struct v4l2_subdev

**Description**

Returns the pointer to the private device data to be stored.

```c
void v4l2_set_subdev_hostdata(struct v4l2_subdev * sd, void * p)
```
Sets V4L2 dev private host data

**Parameters**

struct v4l2_subdev * sd pointer to struct v4l2_subdev
void * p pointer to the private host data to be stored.

```c
void * v4l2_get_subdev_hostdata(const struct v4l2_subdev * sd)
```
Gets V4L2 dev private data

**Parameters**

const struct v4l2_subdev * sd pointer to struct v4l2_subdev

**Description**

Returns the pointer to the private host data to be stored.

```c
int v4l2_subdev_link_validate_default(struct v4l2_subdev * sd, struct media_link * link,  
struct v4l2_subdev_format * source_fmt, struct v4l2_subdev_format * sink_fmt)
```
validates a media link

**Parameters**

struct v4l2_subdev * sd pointer to struct v4l2_subdev
struct media_link * link pointer to struct media_link
struct v4l2_subdev_format * source_fmt pointer to struct v4l2_subdev_format
struct v4l2_subdev_format * sink_fmt pointer to struct v4l2_subdev_format

**Description**

This function ensures that width, height and the media bus pixel code are equal on both source and sink of the link.

```c
int v4l2_subdev_link_validate(struct media_link * link)
```
validates a media link

**Parameters**
struct media_link * link pointer to struct media_link

Description
This function calls the subdev's link_validate_ops to validate if a media link is valid for streaming. It also internally calls v4l2_subdev_link_validate_default() to ensure that width, height and the media bus pixel code are equal on both source and sink of the link.

struct v4l2_subdev_pad_config * v4l2_subdev_alloc_pad_config(struct v4l2_subdev * sd)
Allocates memory for pad config

Parameters
struct v4l2_subdev * sd pointer to struct v4l2_subdev
void v4l2_subdev_free_pad_config(struct v4l2_subdev_pad_config * cfg)
Frees memory allocated by v4l2_subdev_alloc_pad_config().

Parameters
struct v4l2_subdev_pad_config * cfg pointer to struct v4l2_subdev_pad_config
void v4l2_subdev_init(struct v4l2_subdev * sd, const struct v4l2_subdev_ops * ops)
initializes the sub-device struct

Parameters
struct v4l2_subdev * sd pointer to the struct v4l2_subdev to be initialized
const struct v4l2_subdev_ops * ops pointer to struct v4l2_subdev_ops.
void v4l2_subdev_notify_event(struct v4l2_subdev * sd, const struct v4l2_event * ev)
Delivers event notification for subdevice

Parameters
struct v4l2_subdev * sd The subdev for which to deliver the event
const struct v4l2_event * ev The event to deliver

Description
Will deliver the specified event to all userspace event listeners which are subscribed to the v4l2 subdev event queue as well as to the bridge driver using the notify callback. The notification type for the notify callback will be V4L2_DEVICE_NOTIFY_EVENT.

denum v4l2_async_match_type
  type of asynchronous subdevice logic to be used in order to identify a match

Constants
V4L2_ASYNC_MATCH_CUSTOM Match will use the logic provided by struct v4l2_async_subdev.match ops
V4L2_ASYNC_MATCH_DEVNAME Match will use the device name
V4L2_ASYNC_MATCH_I2C Match will check for I2C adapter ID and address
V4L2_ASYNC_MATCH_OF Match will use OF node

Description
This enum is used by the asynchronous sub-device logic to define the algorithm that will be used to match an asynchronous device.

struct v4l2_async_subdev
  sub-device descriptor, as known to a bridge

Definition

```c
struct v4l2_async_subdev {
  enum v4l2_async_match_type match_type;
  union match;
} 2.1. Video2Linux devices
```
struct list_head list;
};

Members

match_type

• **type**: enum v4l2_async_match_type
type of match that will be used

match

• **type**: union
union of per-bus type matching data sets

list

• **type**: struct list_head
used to link struct v4l2_async_subdev objects, waiting to be probed, to a notifier->waiting list

struct v4l2_async_notifier
v4l2_device notifier data

Definition

struct v4l2_async_notifier {
  unsigned int num_subdevs;
  struct v4l2_async_subdev ** subdevs;
  struct v4l2_device * v4l2_dev;
  struct list_head waiting;
  struct list_head done;
  struct list_head list;
  int (* bound) (struct v4l2_asyncNotifier *notifier, struct v4l2_subdev *subdev, struct v4l2_
  async_subdev *asd);
  int (* complete) (struct v4l2_async_notifier *notifier);
  void (* unbind) (struct v4l2_async_notifier *notifier, struct v4l2_subdev *subdev, struct v4l2_
  async_subdev *asd);
};

Members

num_subdevs

• **type**: unsigned int
number of subdevices

subdevs

• **type**: struct v4l2_async_subdev **
array of pointers to subdevice descriptors

v4l2_dev

• **type**: struct v4l2_device *
pointer to struct v4l2_device

waiting

• **type**: struct list_head
list of struct v4l2_async_subdev, waiting for their drivers

done

• **type**: struct list_head
list of struct v4l2_subdev, already probed

list
  • type: struct list_head
    member in a global list of notifiers

bound
  • type: int (*)(struct v4l2_async_notifier *notifier, struct v4l2_subdev *sub-dev, struct v4l2_async_subdev *asd)
    a subdevice driver has successfully probed one of subdevices

complete
  • type: int (*)(struct v4l2_async_notifier *notifier)
    all subdevices have been probed successfully

unbind
  • type: void (*)(struct v4l2_async_notifier *notifier, struct v4l2_subdev *sub-dev, struct v4l2_async_subdev *asd)
    a subdevice is leaving

int v4l2_async_notifier_register(struct v4l2_device *v4l2_dev, struct v4l2_async_notifier *notifier)
  registers a subdevice asynchronous notifier

Parameters
  struct v4l2_device * v4l2_dev pointer to struct v4l2_device
  struct v4l2_async_notifier * notifier pointer to struct v4l2_async_notifier

void v4l2_async_notifier_unregister(struct v4l2_async_notifier * notifier)
  unregisters a subdevice asynchronous notifier

Parameters
  struct v4l2_async_notifier * notifier pointer to struct v4l2_async_notifier

int v4l2_async_register_subdev(struct v4l2_subdev *sd)
  registers a sub-device to the asynchronous subdevice framework

Parameters
  struct v4l2_subdev * sd pointer to struct v4l2_subdev

void v4l2_async_unregister_subdev(struct v4l2_subdev *sd)
  unregisters a sub-device to the asynchronous subdevice framework

Parameters
  struct v4l2_subdev * sd pointer to struct v4l2_subdev

2.1.11 V4L2 events

The V4L2 events provide a generic way to pass events to user space. The driver must use v4l2_fh to be able to support V4L2 events.

Events are defined by a type and an optional ID. The ID may refer to a V4L2 object such as a control ID. If unused, then the ID is 0.

When the user subscribes to an event the driver will allocate a number of kevent structs for that event. So every (type, ID) event tuple will have its own set of kevent structs. This guarantees that if a driver is generating lots of events of one type in a short time, then that will not overwrite events of another type.
But if you get more events of one type than the number of kevents that were reserved, then the oldest event will be dropped and the new one added.

Furthermore, the internal struct `v4l2_subscribed_event` has `merge()` and `replace()` callbacks which drivers can set. These callbacks are called when a new event is raised and there is no more room. The `replace()` callback allows you to replace the payload of the old event with that of the new event, merging any relevant data from the old payload into the new payload that replaces it. It is called when this event type has only one kevent struct allocated. The `merge()` callback allows you to merge the oldest event payload into that of the second-oldest event payload. It is called when there are two or more kevent structs allocated.

This way no status information is lost, just the intermediate steps leading up to that state.

A good example of these `replace/merge` callbacks is in `v4l2-event.c`: `ctrls_replace()` and `ctrls_merge()` callbacks for the control event.

*Note:*

`these callbacks can be called from interrupt context, so they must be fast.`

In order to queue events to video device, drivers should call:

```c
v4l2_event_queue (vdev, ev)
```

The driver’s only responsibility is to fill in the type and the data fields. The other fields will be filled in by V4L2.

**Event subscription**

Subscribing to an event is via:

```c
v4l2_event_subscribe (fh, sub, elems, ops)
```

This function is used to implement `video_device->ioctl_ops->vidioc_subscribe_event`, but the driver must check first if the driver is able to produce events with specified event id, and then should call `v4l2_event_subscribe()` to subscribe the event.

The `elems` argument is the size of the event queue for this event. If it is 0, then the framework will fill in a default value (this depends on the event type).

The `ops` argument allows the driver to specify a number of callbacks:

<table>
<thead>
<tr>
<th>Callback</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>called when a new listener gets added (subscribing to the same event twice will only cause this callback to get called once)</td>
</tr>
<tr>
<td>del</td>
<td>called when a listener stops listening</td>
</tr>
<tr>
<td>replace</td>
<td>replace event ‘old’ with event ‘new’.</td>
</tr>
<tr>
<td>merge</td>
<td>merge event ‘old’ into event ‘new’.</td>
</tr>
</tbody>
</table>

All 4 callbacks are optional, if you don’t want to specify any callbacks the `ops` argument itself maybe NULL.

**Unsubscribing an event**

Unsubscribing to an event is via:

```c
v4l2_event_unsubscribe (fh, sub)
```

This function is used to implement `video_device->ioctl_ops->vidioc_unsubscribe_event`. A driver may call `v4l2_event_unsubscribe()` directly unless it wants to be involved in unsubscription process.
The special type V4L2_EVENT_ALL may be used to unsubscribe all events. The drivers may want to handle this in a special way.

**Check if there’s a pending event**

Checking if there’s a pending event is via:

```c
v4l2_event_pending(fh)
```

This function returns the number of pending events. Useful when implementing poll.

**How events work**

Events are delivered to user space through the poll system call. The driver can use `v4l2_fh->wait` (a `wait_queue_head_t`) as the argument for `poll_wait()`.

There are standard and private events. New standard events must use the smallest available event type. The drivers must allocate their events from their own class starting from class base. Class base is `V4L2_EVENT_PRIVATE_START + n * 1000` where `n` is the lowest available number. The first event type in the class is reserved for future use, so the first available event type is ‘class base + 1’.

An example on how the V4L2 events may be used can be found in the OMAP 3 ISP driver (`drivers/media/platform/omap3isp`).

A subdev can directly send an event to the `v4l2_device` notify function with `V4L2_DEVICE_NOTIFY_EVENT`. This allows the bridge to map the subdev that sends the event to the video node(s) associated with the subdev that need to be informed about such an event.

**V4L2 event functions and data structures**

```c
definition
struct v4l2_kevent
    Internal kernel event struct.

struct v4l2_kevent {
    struct list_head list;
    struct v4l2_subscribed_event * sev;
    struct v4l2_event event;
};
```

**Members**

- **list**
  - *type*: `struct list_head`
    List node for the `v4l2_fh->available list`.

- **sev**
  - *type*: `struct v4l2_subscribed_event`
    Pointer to parent `v4l2_subscribed_event`.

- **event**
  - *type*: `struct v4l2_event`
    The event itself.

**Definition**

2.1. Video2Linux devices
struct v4l2_subscribed_event_ops {
    int (*add) (struct v4l2_subscribed_event *sev, unsigned int elems);
    void (*del) (struct v4l2_subscribed_event *sev);
    void (*replace) (struct v4l2_event *old, const struct v4l2_event *new);
    void (*merge) (const struct v4l2_event *old, struct v4l2_event *new);
};

Members

add

    • type: int (*)(struct v4l2_subscribed_event *sev, unsigned int elems)
      Optional callback, called when a new listener is added

del

    • type: void (*)(struct v4l2_subscribed_event *sev)
      Optional callback, called when a listener stops listening

replace

    • type: void (*)(struct v4l2_event *old, const struct v4l2_event *new)
      Optional callback that can replace event 'old' with event 'new'.

merge

    • type: void (*)(const struct v4l2_event *old, struct v4l2_event *new)
      Optional callback that can merge event 'old' into event 'new'.

struct v4l2_subscribed_event

    Internal struct representing a subscribed event.

Definition

struct v4l2_subscribed_event {
    struct list_head list;
    u32 type;
    u32 id;
    u32 flags;
    struct v4l2_fh *fh;
    struct list_head node;
    const struct v4l2_subscribed_event_ops *ops;
    unsigned int elems;
    unsigned int first;
    unsigned int in_use;
    struct v4l2_kevent events[];
};

Members

list

    • type: struct list_head
      List node for the v4l2_fh->subscribed list.

type

    • type: u32
      Event type.

id

    • type: u32
      Associated object ID (e.g. control ID). 0 if there isn’t any.
flags
  • type: u32
    Copy of v4l2_event_subscription->flags.

fh
  • type: struct v4l2_fh *
    Filehandle that subscribed to this event.

node
  • type: struct list_head
    List node that hooks into the object's event list (if there is one).

ops
  • type: const struct v4l2_subscribed_event_ops *
    v4l2_subscribed_event_ops

elems
  • type: unsigned int
    The number of elements in the events array.

first
  • type: unsigned int
    The index of the events containing the oldest available event.

in_use
  • type: unsigned int
    The number of queued events.

events[]
  • type: struct v4l2_kevent
    An array of elems events.

int v4l2_event_dequeue(struct v4l2_fh * fh, struct v4l2_event * event, int nonblocking)
  Dequeue events from video device.

Parameters
struct v4l2_fh * fh pointer to struct v4l2_fh
struct v4l2_event * event pointer to struct v4l2_event
int nonblocking if not zero, waits for an event to arrive

void v4l2_event_queue(struct video_device * vdev, const struct v4l2_event * ev)
  Queue events to video device.

Parameters
struct video_device * vdev pointer to struct video_device
const struct v4l2_event * ev pointer to struct v4l2_event

Description
The event will be queued for all struct v4l2_fh file handlers.

2.1. Video2Linux devices
void \texttt{v4l2\_event\_queue\_fh}(\texttt{struct v4l2\_fh * fh}, \texttt{const struct v4l2\_event * ev})
Queue events to video device.

\textbf{Parameters}
- \texttt{struct v4l2\_fh * fh} pointer to \texttt{struct v4l2\_fh}
- \texttt{const struct v4l2\_event * ev} pointer to \texttt{struct v4l2\_event}

\textbf{Description}
The event will be queued only for the specified \texttt{struct v4l2\_fh} file handler.

\textbf{Note:}
The driver's only responsibility is to fill in the type and the data fields. The other fields will be filled in by V4L2.

int \texttt{v4l2\_event\_pending}(\texttt{struct v4l2\_fh * fh})
Check if an event is available

\textbf{Parameters}
- \texttt{struct v4l2\_fh * fh} pointer to \texttt{struct v4l2\_fh}

\textbf{Description}
Returns the number of pending events.

int \texttt{v4l2\_event\_subscribe}(\texttt{struct v4l2\_fh * fh}, \texttt{const struct v4l2\_event\_subscription * sub}, \texttt{unsigned int elems}, \texttt{const struct v4l2\_subscribed\_event\_ops * ops})
Subscribes to an event

\textbf{Parameters}
- \texttt{struct v4l2\_fh * fh} pointer to \texttt{struct v4l2\_fh}
- \texttt{const struct v4l2\_event\_subscription * sub} pointer to \texttt{struct v4l2\_event\_subscription}
- \texttt{unsigned int elems} size of the events queue
- \texttt{const struct v4l2\_subscribed\_event\_ops * ops} pointer to \texttt{v4l2\_subscribed\_event\_ops}

\textbf{Description}
- \textbf{Note:}
  - if \texttt{elems} is zero, the framework will fill in a default value, with is currently 1 element.

int \texttt{v4l2\_event\_unsubscribe}(\texttt{struct v4l2\_fh * fh}, \texttt{const struct v4l2\_event\_subscription * sub})
Unsubscribes to an event

\textbf{Parameters}
- \texttt{struct v4l2\_fh * fh} pointer to \texttt{struct v4l2\_fh}
- \texttt{const struct v4l2\_event\_subscription * sub} pointer to \texttt{struct v4l2\_event\_subscription}
void v4l2_event_unsubscribe_all(struct v4l2_fh * fh)
    Unsubscribes to all events

Parameters

struct v4l2_fh * fh pointer to struct v4l2_fh

int v4l2_event_subdev_unsubscribe(struct v4l2_subdev * sd, struct v4l2_fh * fh, struct v4l2_event_subscription * sub)
    Subdev variant of v4l2_event_unsubscribe()

Parameters

struct v4l2_subdev * sd pointer to struct v4l2_subdev
struct v4l2_fh * fh pointer to struct v4l2_fh
struct v4l2_event_subscription * sub pointer to struct v4l2_event_subscription

Description

Note:

This function should be used for the struct v4l2_subdev_core_ops unsubscribe_event field.

int v4l2_src_change_event_subscribe(struct v4l2_fh * fh, const struct v4l2_event_subscription * sub)

Parameters

struct v4l2_fh * fh pointer to struct v4l2_fh
const struct v4l2_event_subscription * sub pointer to struct v4l2_event_subscription

int v4l2_src_change_event_subdev_subscribe(struct v4l2_subdev * sd, struct v4l2_fh * fh, struct v4l2_event_subscription * sub)
    Variant of v4l2_event_subscribe(), meant to subscribe only events of the type V4L2_EVENT_SOURCE_CHANGE.

Parameters

struct v4l2_subdev * sd pointer to struct v4l2_subdev
struct v4l2_fh * fh pointer to struct v4l2_fh
struct v4l2_event_subscription * sub pointer to struct v4l2_event_subscription

2.1.12 V4L2 Controls

Introduction

The V4L2 control API seems simple enough, but quickly becomes very hard to implement correctly in drivers. But much of the code needed to handle controls is actually not driver specific and can be moved to the V4L core framework.

After all, the only part that a driver developer is interested in is:

1. How do I add a control?
2. How do I set the control’s value? (i.e. s_ctrl)

And occasionally:

3. How do I get the control’s value? (i.e. g_volatile_ctrl)
4. How do I validate the user’s proposed control value? (i.e. try_ctrl)
All the rest is something that can be done centrally.

The control framework was created in order to implement all the rules of the V4L2 specification with respect to controls in a central place. And to make life as easy as possible for the driver developer.

Note that the control framework relies on the presence of a struct `v4l2_device` for V4L2 drivers and struct `v4l2_subdev` for sub-device drivers.

**Objects in the framework**

There are two main objects:

The `v4l2_ctrl` object describes the control properties and keeps track of the control's value (both the current value and the proposed new value).

`v4l2_ctrl_handler` is the object that keeps track of controls. It maintains a list of `v4l2_ctrl` objects that it owns and another list of references to controls, possibly to controls owned by other handlers.

**Basic usage for V4L2 and sub-device drivers**

1. Prepare the driver:
   1.1) Add the handler to your driver's top-level struct:

   ```c
   struct foo_dev {
       ...
       struct v4l2_ctrl_handler ctrl_handler;
       ...
   };
   struct foo_dev *foo;
   ```

   1.2) Initialize the handler:

   ```c
   v4l2_ctrl_handler_init(&foo->ctrl_handler, nr_of_controls);
   ```

   The second argument is a hint telling the function how many controls this handler is expected to handle. It will allocate a hashtable based on this information. It is a hint only.

   1.3) Hook the control handler into the driver:

   1.3.1) For V4L2 drivers do this:

   ```c
   struct foo_dev {
       ...
       struct v4l2_device v4l2_dev;
       ...
       struct v4l2_ctrl_handler ctrl_handler;
       ...
   };
   foo->v4l2_dev.ctrl_handler = &foo->ctrl_handler;
   ```

   Where `foo->v4l2_dev` is of type struct `v4l2_device`.

   Finally, remove all control functions from your `v4l2_ioctl_ops` (if any): `vidioc_queryctrl`, `vidioc_query_ext_ctrl`, `vidioc_querymenu`, `vidioc_g_ctrl`, `vidioc_s_ctrl`, `vidioc_g_extCtrls`, `vidioc_try_extCtrls` and `vidioc_s_extCtrls`. Those are now no longer needed.

   1.3.2) For sub-device drivers do this:
struct foo_dev {
...  
  struct v4l2_subdev sd;
...  
  struct v4l2_ctrl_handler ctrl_handler;
...  
};

foo->sd.ctrl_handler = &foo->ctrl_handler;

Where foo->sd is of type struct v4l2_subdev.

1.4) Clean up the handler at the end:

v4l2_ctrl_handler_free(&foo->ctrl_handler);

2. Add controls:

You add non-menu controls by calling v4l2_ctrl_new_std:

```c
struct v4l2_ctrl *v4l2_ctrl_new_std(struct v4l2_ctrl_handler *hdl,
  const struct v4l2_ctrl_ops *ops,
  u32 id, s32 min, s32 max, u32 step, s32 def);
```

Menu and integer menu controls are added by calling v4l2_ctrl_new_std_menu:

```c
struct v4l2_ctrl *v4l2_ctrl_new_std_menu(struct v4l2_ctrl_handler *hdl,
  const struct v4l2_ctrl_ops *ops,
  u32 id, s32 max, s32 skip_mask, s32 def);
```

Menu controls with a driver specific menu are added by calling v4l2_ctrl_new_std_menu_items:

```c
struct v4l2_ctrl *v4l2_ctrl_new_std_menu_items(
  struct v4l2_ctrl_handler *hdl,
  const struct v4l2_ctrl_ops *ops, u32 id, s32 max,
  s32 skip_mask, s32 def, const char * const *qmenu);
```

Integer menu controls with a driver specific menu can be added by calling v4l2_ctrl_new_int_menu:

```c
struct v4l2_ctrl *v4l2_ctrl_new_int_menu(struct v4l2_ctrl_handler *hdl,
  const struct v4l2_ctrl_ops *ops,
  u32 id, s32 max, s32 def, const s64 *qmenu_int);
```

These functions are typically called right after the v4l2_ctrl_handler_init:

```c
static const s64 exp_bias_qmenu[] = {
  -2, -1, 0, 1, 2
};
static const char * const test_pattern[] = {
  "Disabled",
  "Vertical Bars",
  "Solid Black",
  "Solid White",
};

v4l2_ctrl_handler_init(&foo->ctrl_handler, nr_of_controls);
```

v4l2_ctrl_new_std(&foo->ctrl_handler, &foo_ctrl_ops,
V4L2_CID_BRIGHTNESS, 0, 255, 1, 128);

v4l2_ctrl_new_std(&foo->ctrl_handler, &foo_ctrl_ops,
V4L2_CID_CONTRAST, 0, 255, 1, 128);

v4l2_ctrl_new_std_menu(&foo->ctrl_handler, &foo_ctrl_ops,
V4L2_CID_POWER_LINE_FREQUENCY,
V4L2_CID_POWER_LINE_FREQUENCY_60HZ, 0,
V4L2_CID_POWER_LINE_FREQUENCY_DISABLED); v4l2_ctrl_new_int_menu(&foo->ctrl_handler, &foo_ctrl_ops, V4L2_CID_EXPOSURE_BIAS, ARRAY_SIZE(exp_bias_qmenu) - 1, ARRAY_SIZE(exp_bias_qmenu) / 2 - 1, exp_bias_qmenu);
 v4l2_ctrl_new_std_menu_items(&foo->ctrl_handler, &foo_ctrl_ops, V4L2_CID_TEST_PATTERN, ARRAY_SIZE(test_pattern) - 1, 0, 0, test_pattern);

... if (foo->ctrl_handler.error) {
    int err = foo->ctrl_handler.error;
    v4l2_ctrl_handler_free(&foo->ctrl_handler);
    return err;
}

The v4l2_ctrl_new_std function returns the v4l2_ctrl pointer to the new control, but if you do not need to access the pointer outside the control ops, then there is no need to store it.

The v4l2_ctrl_new_std function will fill in most fields based on the control ID except for the min, max, step and default values. These are passed in the last four arguments. These values are driver specific while control attributes like type, name, flags are all global. The control's current value will be set to the default value.

The v4l2_ctrl_new_std_menu function is very similar but it is used for menu controls. There is no min argument since that is always 0 for menu controls, and instead of a step there is a skip_mask argument: if bit X is 1, then menu item X is skipped.

The v4l2_ctrl_new_int_menu function creates a new standard integer menu control with driver-specific items in the menu. It differs from v4l2_ctrl_new_std_menu in that it doesn't have the mask argument and takes as the last argument an array of signed 64-bit integers that form an exact menu item list.

The v4l2_ctrl_new_std_menu_items function is very similar to v4l2_ctrl_new_std_menu but takes an extra parameter qmenu, which is the driver specific menu for an otherwise standard menu control. A good example for this control is the test pattern control for capture/display/sensors devices that have the capability to generate test patterns. These test patterns are hardware specific, so the contents of the menu will vary from device to device.

Note that if something fails, the function will return NULL or an error and set ctrl_handler->error to the error code. If ctrl_handler->error was already set, then it will just return and do nothing. This is also true for v4l2_ctrl_handler_init if it cannot allocate the internal data structure.

This makes it easy to init the handler and just add all controls and only check the error code at the end. Saves a lot of repetitive error checking.

It is recommended to add controls in ascending control ID order: it will be a bit faster that way.

3. Optionally force initial control setup:

v4l2_ctrl_handler_setup(&foo->ctrl_handler);

This will call s_ctrl for all controls unconditionally. Effectively this initializes the hardware to the default control values. It is recommended that you do this as this ensures that both the internal data structures and the hardware are in sync.

4. Finally: implement the v4l2_ctrl_ops

static const struct v4l2_ctrl_ops foo_ctrl_ops = {
    .s_ctrl = foo_s_ctrl,
};

Usually all you need is s_ctrl:
static int foo_s_ctrl(struct v4l2_ctrl *ctrl)
{
    struct foo *state = container_of(ctrl->handler, struct foo, ctrl_handler);

    switch (ctrl->id) {
    case V4L2_CID_BRIGHTNESS:
        write_reg(0x123, ctrl->val);
        break;
    case V4L2_CID_CONTRAST:
        write_reg(0x456, ctrl->val);
        break;
    }
    return 0;
}

The control ops are called with the v4l2_ctrl pointer as argument. The new control value has already been validated, so all you need to do is to actually update the hardware registers.

You’re done! And this is sufficient for most of the drivers we have. No need to do any validation of control values, or implement QUERYCTRL, QUERY_EXT_CTRL and QUERYMENU. And G/S_CTRL as well as G/TRY/S_EXT_CTRLS are automatically supported.

Note:
The remainder sections deal with more advanced controls topics and scenarios. In practice the basic usage as described above is sufficient for most drivers.

Inheriting Controls

When a sub-device is registered with a V4L2 driver by calling v4l2_device_register_subdev() and the ctrl_handler fields of both v4l2_subdev and v4l2_device are set, then the controls of the subdev will become automatically available in the V4L2 driver as well. If the subdev driver contains controls that already exist in the V4L2 driver, then those will be skipped (so a V4L2 driver can always override a subdev control).

What happens here is that v4l2_device_register_subdev() calls v4l2_ctrl_add_handler() adding the controls of the subdev to the controls of v4l2_device.

Accessing Control Values

The following union is used inside the control framework to access control values:

union v4l2_ctrl_ptr {
    s32 *p_s32;
    s64 *p_s64;
    char *p_char;
    void *p;
};

The v4l2_ctrl struct contains these fields that can be used to access both current and new values:

s32 val;
struct {
    s32 val;
} cur;

union v4l2_ctrl_ptr p_new;
union v4l2_ctrl_ptr p_cur;
If the control has a simple s32 type type, then:

```c
g ctrl->val == ctrl->p_new.p_s32
g ctrl->cur.val == ctrl->p_cur.p_s32
```

For all other types use `ctrl->p_cur.p<something>`. Basically the val and cur.val fields can be considered an alias since these are used so often.

Within the control ops you can freely use these. The val and cur.val speak for themselves. The p_char pointers point to character buffers of length `ctrl->maximum + 1`, and are always 0-terminated.

Unless the control is marked volatile the p_cur field points to the the current cached control value. When you create a new control this value is made identical to the default value. After calling `v4l2_ctrl_handler_setup()` this value is passed to the hardware. It is generally a good idea to call this function.

Whenever a new value is set that new value is automatically cached. This means that most drivers do not need to implement the `g_volatile_ctrl()` op. The exception is for controls that return a volatile register such as a signal strength read-out that changes continuously. In that case you will need to implement `g_volatile_ctrl` like this:

```c
static int foo_g_volatile_ctrl(struct v4l2_ctrl *ctrl) {
    switch (ctrl->id) {
        case V4L2_CID_BRIGHTNESS:
            ctrl->val = read_reg(0x123);
            break;
    }
}
```

Note that you use the `new value` union as well in `g_volatile_ctrl`. In general controls that need to implement `g_volatile_ctrl` are read-only controls. If they are not, a `V4L2_EVENT_CTRL_CH_VALUE` will not be generated when the control changes.

To mark a control as volatile you have to set `V4L2_CTRL_FLAG_VOLATILE`:

```c
ctrl = v4l2_ctrl_new_std(&sd->ctrl_handler, ...);
if (ctrl)
    ctrl->flags |= V4L2_CTRL_FLAG_VOLATILE;
```

For try/s_ctrl the new values (i.e. as passed by the user) are filled in and you can modify them in try_ctrl or set them in s_ctrl. The `cur` union contains the current value, which you can use (but not change!) as well.

If s_ctrl returns 0 (OK), then the control framework will copy the new final values to the `cur` union.

While in `g_volatile/s/try_ctrl` you can access the value of all controls owned by the same handler since the handler’s lock is held. If you need to access the value of controls owned by other handlers, then you have to be very careful not to introduce deadlocks.

Outside of the control ops you have to go through to helper functions to get or set a single control value safely in your driver:

```c
s32 v4l2_ctrl_get_ctrl(struct v4l2_ctrl *ctrl);
int v4l2_ctrl_set_ctrl(struct v4l2_ctrl *ctrl, s32 val);
```

These functions go through the control framework just as VIDIOC_G/S_CTRL ioctls do. Don’t use these inside the control ops `g_volatile/s/try_ctrl`, though, that will result in a deadlock since these helpers lock the handler as well.

You can also take the handler lock yourself:

```c
mutex_lock(&state->ctrl_handler.lock);
pr_info("String value is '%s'\n", ctrl1->p_cur.p_char);
```
Menu Controls

The `v4l2_ctrl` struct contains this union:

```c
union {
    u32 step;
    u32 menu_skip_mask;
};
```

For menu controls `menu_skip_mask` is used. What it does is that it allows you to easily exclude certain menu items. This is used in the `VIDIOC_QUERYMENU` implementation where you can return `-EINVAL` if a certain menu item is not present. Note that `VIDIOC_QUERYCTRL` always returns a step value of 1 for menu controls.

A good example is the MPEG Audio Layer II Bitrate menu control where the menu is a list of standardized possible bitrates. But in practice hardware implementations will only support a subset of those. By setting the skip mask you can tell the framework which menu items should be skipped. Setting it to 0 means that all menu items are supported.

You set this mask either through the `v4l2_ctrl_config` struct for a custom control, or by calling `v4l2_ctrl_new_std_menu()`.

Custom Controls

Driver specific controls can be created using `v4l2_ctrl_new_custom()`:

```c
static const struct v4l2_ctrl_config ctrl_filter = {
    .ops = &ctrl_custom_ops,
    .id = V4L2_CID_MPEG_CX2341X_VIDEO_SPATIAL_FILTER,
    .name = "Spatial Filter",
    .type = V4L2_CTRL_TYPE_INTEGER,
    .flags = V4L2_CTRL_FLAG_SLIDER,
    .max = 15,
    .step = 1,
};

ctrl = v4l2_ctrl_new_custom(&foo->ctrl_handler, &ctrl_filter, NULL);
```

The last argument is the `priv` pointer which can be set to driver-specific private data. The `v4l2_ctrl_config` struct also has a field to set the `is_private` flag.

If the name field is not set, then the framework will assume this is a standard control and will fill in the name, type and flags fields accordingly.

Active and Grabbed Controls

If you get more complex relationships between controls, then you may have to activate and deactivate controls. For example, if the Chroma AGC control is on, then the Chroma Gain control is inactive. That is, you may set it, but the value will not be used by the hardware as long as the automatic gain control is on. Typically user interfaces can disable such input fields.

You can set the ‘active’ status using `v4l2_ctrl_activate()`. By default all controls are active. Note that the framework does not check for this flag. It is meant purely for GUIs. The function is typically called from within `s_ctrl`. 

2.1. Video2Linux devices
The other flag is the ‘grabbed’ flag. A grabbed control means that you cannot change it because it is in use by some resource. Typical examples are MPEG bitrate controls that cannot be changed while capturing is in progress.

If a control is set to ‘grabbed’ using v4l2_ctrl_grab(), then the framework will return -EBUSY if an attempt is made to set this control. The v4l2_ctrl_grab() function is typically called from the driver when it starts or stops streaming.

Control Clusters

By default all controls are independent from the others. But in more complex scenarios you can get dependencies from one control to another. In that case you need to ‘cluster’ them:

```c
struct foo {
    struct v4l2_ctrl_handler ctrl_handler;
    #define AUDIO_CL_VOLUME (0)
    #define AUDIO_CL_MUTE (1)
    struct v4l2_ctrl *audio_cluster[2];
    ...
};
state->audio_cluster[AUDIO_CL_VOLUME] =
    v4l2_ctrl_new_std(&state->ctrl_handler, ...);
state->audio_cluster[AUDIO_CL_MUTE] =
    v4l2_ctrl_new_std(&state->ctrl_handler, ...);
state->audio_cluster[AUDIO_CL_VOLUME] =
    v4l2_ctrl_cluster(ARRAY_SIZE(state->audio_cluster), state->audio_cluster);
```

From now on whenever one or more of the controls belonging to the same cluster is set (or ‘gotten’, or ‘tried’), only the control ops of the first control (‘volume’ in this example) is called. You effectively create a new composite control. Similar to how a ‘struct’ works in C.

So when s_ctrl is called with V4L2_CID_AUDIO_VOLUME as argument, you should set all two controls belonging to the audio_cluster:

```c
static int foo_s_ctrl(struct v4l2_ctrl *ctrl)
{
    struct foo *state = container_of(ctrl->handler, struct foo, ctrl_handler);

    switch (ctrl->id) {
    case V4L2_CID_AUDIO_VOLUME:
        struct v4l2_ctrl *mute = ctrl->cluster[AUDIO_CL_MUTE];
        write_reg(0x123, mute->val ? 0 : ctrl->val);
        break;
    case V4L2_CID_CONTRAST:
        write_reg(0x456, ctrl->val);
        break;
    }
    return 0;
}
```

In the example above the following are equivalent for the VOLUME case:

```
ctrl == ctrl->cluster[AUDIO_CL_VOLUME] == state->audio_cluster[AUDIO_CL_VOLUME]
ctrl->cluster[AUDIO_CL_MUTE] == state->audio_cluster[AUDIO_CL_MUTE]
```

In practice using cluster arrays like this becomes very tiresome. So instead the following equivalent method is used:

```c
struct {
    /* audio cluster */
    ...
}
```

656 Chapter 2. Media subsystem kernel internal API
The anonymous struct is used to clearly ‘cluster’ these two control pointers, but it serves no other purpose. The effect is the same as creating an array with two control pointers. So you can just do:

```c
struct v4l2_ctrl *volume;
struct v4l2_ctrl *mute;
```

And in foo_s_ctrl you can use these pointers directly: state->mute->val.

Note that controls in a cluster may be NULL. For example, if for some reason mute was never added (because the hardware doesn’t support that particular feature), then mute will be NULL. So in that case we have a cluster of 2 controls, of which only 1 is actually instantiated. The only restriction is that the first control of the cluster must always be present, since that is the ‘master’ control of the cluster. The master control is the one that identifies the cluster and that provides the pointer to the v4l2_ctrl_ops struct that is used for that cluster.

Obviously, all controls in the cluster array must be initialized to either a valid control or to NULL.

In rare cases you might want to know which controls of a cluster actually were set explicitly by the user. For this you can check the ‘is_new’ flag of each control. For example, in the case of a volume/mute cluster the ‘is_new’ flag of the mute control would be set if the user called VIDIOC_S_CTRL for mute only. If the user would call VIDIOC_S_EXT_CTRLS for both mute and volume controls, then the ‘is_new’ flag would be 1 for both controls.

The ‘is_new’ flag is always 1 when called from v4l2_ctrl_handler_setup().

### Handling autogain/gain-type Controls with Auto Clusters

A common type of control cluster is one that handles ‘auto-foo/foo’-type controls. Typical examples are autogain/gain, autoexposure/exposure, autowhitebalance/red balance/blue balance. In all cases you have one control that determines whether another control is handled automatically by the hardware, or whether it is under manual control from the user.

If the cluster is in automatic mode, then the manual controls should be marked inactive and volatile. When the volatile controls are read the g_volatile_ctrl operation should return the value that the hardware’s automatic mode set up automatically.

If the cluster is put in manual mode, then the manual controls should become active again and the volatile flag is cleared (so g_volatile_ctrl is no longer called while in manual mode). In addition just before switching to manual mode the current values as determined by the auto mode are copied as the new manual values.

Finally the V4L2_CTRL_FLAG_UPDATE should be set for the auto control since changing that control affects the control flags of the manual controls.

In order to simplify this a special variation of v4l2_ctrl_cluster was introduced:

```c
void v4l2_ctrl_auto_cluster(unsigned ncontrols, struct v4l2_ctrl **controls, u8 manual_val, bool set_volatile);
```

The first two arguments are identical to v4l2_ctrl_cluster. The third argument tells the framework which value switches the cluster into manual mode. The last argument will optionally set V4L2_CTRL_FLAG_VOLATILE for the non-auto controls. If it is false, then the manual controls are never volatile. You would typically use that if the hardware does not give you the option to read back to values as determined by the auto mode (e.g. if autogain is on, the hardware doesn’t allow you to obtain the current gain value).

The first control of the cluster is assumed to be the ‘auto’ control.

Using this function will ensure that you don’t need to handle all the complex flag and volatile handling.
VIDIOC_LOG_STATUS Support

This ioctl allow you to dump the current status of a driver to the kernel log. The \texttt{v4l2_ctrl_handler_log_status} can be used to dump the value of the controls owned by the given handler to the log. You can supply a prefix as well. If the prefix didn’t end with a space, then ‘: ‘ will be added for you.

Different Handlers for Different Video Nodes

Usually the V4L2 driver has just one control handler that is global for all video nodes. But you can also specify different control handlers for different video nodes. You can do that by manually setting the\texttt{ctrl_handler} field of struct video_device.

That is no problem if there are no subdevs involved but if there are, then you need to block the automatic merging of subdev controls to the global control handler. You do that by simply setting the\texttt{ctrl_handler} field in struct v4l2_device to NULL. Now v4l2_device_register_subdev() will no longer merge subdev controls.

After each subdev was added, you will then have to call \texttt{v4l2_ctrl_add_handler} manually to add the subdev’s control handler (\texttt{sd->ctrl_handler}) to the desired control handler. This control handler may be specific to the video_device or for a subset of video_device’s. For example: the radio device nodes only have audio controls, while the video and vbi device nodes share the same control handler for the audio and video controls.

If you want to have one handler (e.g. for a radio device node) have a subset of another handler (e.g. for a video device node), then you should first add the controls to the first handler, add the other controls to the second handler and finally add the first handler to the second. For example:

\begin{verbatim}
\texttt{v4l2_ctrl_new_std}(&radio_ctrl_handler, &radio_ops, V4L2_CID_AUDIO_VOLUME, ...);
\texttt{v4l2_ctrl_new_std}(&radio_ctrl_handler, &radio_ops, V4L2_CID_AUDIO_MUTE, ...);
\texttt{v4l2_ctrl_new_std}(&video_ctrl_handler, &video_ops, V4L2_CID_BRIGHTNESS, ...);
\texttt{v4l2_ctrl_new_std}(&video_ctrl_handler, &video_ops, V4L2_CID_CONTRAST, ...);
\texttt{v4l2_ctrl_add_handler}(&video_ctrl_handler, &radio_ctrl_handler, NULL);
\end{verbatim}

The last argument to \texttt{v4l2_ctrl_add_handler()} is a filter function that allows you to filter which controls will be added. Set it to NULL if you want to add all controls.

Or you can add specific controls to a handler:

\begin{verbatim}
volume = \texttt{v4l2_ctrl_new_std}(&video_ctrl_handler, &ops, V4L2_CID_AUDIO_VOLUME, ...);
\texttt{v4l2_ctrl_new_std}(&video_ctrl_handler, &ops, V4L2_CID_BRIGHTNESS, ...);
\texttt{v4l2_ctrl_new_std}(&video_ctrl_handler, &ops, V4L2_CID_CONTRAST, ...);
\end{verbatim}

What you should not do is make two identical controls for two handlers. For example:

\begin{verbatim}
\texttt{v4l2_ctrl_new_std}(&radio_ctrl_handler, &radio_ops, V4L2_CID_AUDIO_MUTE, ...);
\texttt{v4l2_ctrl_new_std}(&video_ctrl_handler, &video_ops, V4L2_CID_AUDIO_MUTE, ...);
\end{verbatim}

This would be bad since muting the radio would not change the video mute control. The rule is to have one control for each hardware ‘knob’ that you can twiddle.

Finding Controls

Normally you have created the controls yourself and you can store the struct v4l2_ctrl pointer into your own struct.

But sometimes you need to find a control from another handler that you do not own. For example, if you have to find a volume control from a subdev.

You can do that by calling \texttt{v4l2_ctrl_find}:
Since v4l2_ctrl_find will lock the handler you have to be careful where you use it. For example, this is not a good idea:

```c
struct v4l2_ctrl *volume;
volume = v4l2_ctrl_find(sd->ctrl_handler, V4L2_CID_AUDIO_VOLUME);
```

When v4l2_ctrl_new_std is called by the framework the ctrl_handler.lock is already taken, so attempting to find another control from the same handler will deadlock.

It is recommended not to use this function from inside the control ops.

**Inheriting Controls**

When one control handler is added to another using v4l2_ctrl_add_handler, then by default all controls from one are merged to the other. But a subdev might have low-level controls that make sense for some advanced embedded system, but not when it is used in consumer-level hardware. In that case you want to keep those low-level controls local to the subdev. You can do this by simply setting the ‘is_private’ flag of the control to 1:

```c
static const struct v4l2_ctrl_config ctrl_private = {
    .ops = &ctrl_custom_ops,
    .id = V4L2_CID ...
    .name = "Some Private Control",
    .type = V4L2_CTRL_TYPE_INTEGER,
    .max = 15,
    .step = 1,
    .is_private = 1,
};
ctrl = v4l2_ctrl_new_custom(&foo->ctrl_handler, &ctrl_private, NULL);
```

These controls will now be skipped when v4l2_ctrl_add_handler is called.

**V4L2_CTRL_TYPE_CTRL_CLASS Controls**

Controls of this type can be used by GUIs to get the name of the control class. A fully featured GUI can make a dialog with multiple tabs with each tab containing the controls belonging to a particular control class. The name of each tab can be found by querying a special control with ID <control class | 1>.

Drivers do not have to care about this. The framework will automatically add a control of this type whenever the first control belonging to a new control class is added.

**Adding Notify Callbacks**

Sometimes the platform or bridge driver needs to be notified when a control from a sub-device driver changes. You can set a notify callback by calling this function:
```c
void v4l2_ctrl_notify(struct v4l2_ctrl *ctrl,
          void (*notify)(struct v4l2_ctrl *ctrl, void *priv), void *priv);
```

Whenever the given control changes value the notify callback will be called with a pointer to the control and the priv pointer that was passed with v4l2_ctrl_notify. Note that the control’s handler lock is held when the notify function is called.

There can be only one notify function per control handler. Any attempt to set another notify function will cause a WARN_ON.

**v4l2_ctrl functions and data structures**

```c
union v4l2_ctrl_ptr
    A pointer to a control value.

Definition
```

```c
union v4l2_ctrl_ptr {
    s32  * p_s32;
    s64  * p_s64;
    u8   * p_u8;
    u16  * p_u16;
    u32  * p_u32;
    char * p_char;
    void * p;
};
```

**Members**

```c
p_s32
    • type: s32 *
    Pointer to a 32-bit signed value.
```

```c
p_s64
    • type: s64 *
    Pointer to a 64-bit signed value.
```

```c
p_u8
    • type: u8 *
    Pointer to a 8-bit unsigned value.
```

```c
p_u16
    • type: u16 *
    Pointer to a 16-bit unsigned value.
```

```c
p_u32
    • type: u32 *
    Pointer to a 32-bit unsigned value.
```

```c
p_char
    • type: char *
    Pointer to a string.
```

```c
p
    • type: void *
```
Pointer to a compound value.

struct v4l2_ctrl_ops
The control operations that the driver has to provide.

Definition

```c
struct v4l2_ctrl_ops {
    int (* g_volatile_ctrl) (struct v4l2_ctrl *ctrl);
    int (* try_ctrl) (struct v4l2_ctrl *ctrl);
    int (* s_ctrl) (struct v4l2_ctrl *ctrl);
};
```

Members

**g_volatile_ctrl**
- **type**: int (*)(struct v4l2_ctrl *ctrl)
  Get a new value for this control. Generally only relevant for volatile (and usually read-only) controls such as a control that returns the current signal strength which changes continuously. If not set, then the currently cached value will be returned.

**try_ctrl**
- **type**: int (*)(struct v4l2_ctrl *ctrl)
  Test whether the control's value is valid. Only relevant when the usual min/max/step checks are not sufficient.

**s_ctrl**
- **type**: int (*)(struct v4l2_ctrl *ctrl)
  Actually set the new control value. s_ctrl is compulsory. The ctrl->handler->lock is held when these ops are called, so no one else can access controls owned by that handler.

struct v4l2_ctrl_type_ops
The control type operations that the driver has to provide.

Definition

```c
struct v4l2_ctrl_type_ops {
    bool (* equal) (const struct v4l2_ctrl *ctrl, u32 idx,union v4l2_ctrl_ptr ptr1,union v4l2_ctrl_ptr ptr2);
    void (* init) (const struct v4l2_ctrl *ctrl, u32 idx,union v4l2_ctrl_ptr ptr);
    void (* log) (const struct v4l2_ctrl *ctrl);
    int (* validate) (const struct v4l2_ctrl *ctrl, u32 idx,union v4l2_ctrl_ptr ptr);
};
```

Members

**equal**
- **type**: bool (*)(const struct v4l2_ctrl *ctrl,u32 idx,union v4l2_ctrl_ptr ptr1,union v4l2_ctrl_ptr ptr2)
  return true if both values are equal.

**init**
- **type**: void (*)(const struct v4l2_ctrl *ctrl,u32 idx,union v4l2_ctrl_ptr ptr)
  initialize the value.

**log**
- **type**: void (*)(const struct v4l2_ctrl *ctrl)
  log the value.

2.1. Video2Linux devices
validate

- **type**: int (*)(const struct v4l2_ctrl *ctrl, u32 idx, union v4l2_ctrl_ptr ptr)
  validate the value. Return 0 on success and a negative value otherwise.

**struct v4l2_ctrl**

The control structure.

**Definition**

```c
struct v4l2_ctrl {
    struct list_head node;
    struct list_head ev_subs;
    struct v4l2_ctrl_handler * handler;
    struct v4l2_ctrl ** cluster;
    unsigned int ncontrols;
    unsigned int done:1;
    unsigned int is_new:1;
    unsigned int has_changed:1;
    unsigned int is_private:1;
    unsigned int is_auto:1;
    unsigned int is_int:1;
    unsigned int is_string:1;
    unsigned int is_ptr:1;
    unsigned int is_array:1;
    unsigned int has_volatile:1;
    unsigned int call_notify:1;
    unsigned int manual_mode_value:8;
    const struct v4l2_ctrl_ops * ops;
    const struct v4l2_ctrl_type_ops * type_ops;
    u32 id;
    const char * name;
    enum v4l2_ctrl_type type;
    s64 minimum;
    s64 maximum;
    s64 default_value;
    u32 elems;
    u32 elem_size;
    u32 dims[V4L2_CTRL_MAX_DIMS];
    u32 nr_of_dims;
    union cur;
    union v4l2_ctrl_ptr p_new;
    union v4l2_ctrl_ptr p_cur;
};
```

**Members**

- **node**
  - **type**: struct list_head
    The list node.

- **ev_subs**
  - **type**: struct list_head
    The list of control event subscriptions.

- **handler**
  - **type**: struct v4l2_ctrl_handler *
    The handler that owns the control.

- **cluster**
  - **type**: struct v4l2_ctrl **
Point to start of cluster array.

**ncontrols**
- **type**: `unsigned int`
  Number of controls in cluster array.

**done**
- **type**: `unsigned int:1`
  Internal flag: set for each processed control.

**is_new**
- **type**: `unsigned int:1`
  Set when the user specified a new value for this control. It is also set when called from `v4l2_ctrl_handler_setup()`. Drivers should never set this flag.

**has_changed**
- **type**: `unsigned int:1`
  Set when the current value differs from the new value. Drivers should never use this flag.

**is_private**
- **type**: `unsigned int:1`
  If set, then this control is private to its handler and it will not be added to any other handlers. Drivers can set this flag.

**is_auto**
- **type**: `unsigned int:1`
  If set, then this control selects whether the other cluster members are in ‘automatic’ mode or ‘manual’ mode. This is used for autogain/gain type clusters. Drivers should never set this flag directly.

**is_int**
- **type**: `unsigned int:1`
  If set, then this control has a simple integer value (i.e. it uses `ctrl->val`).

**is_string**
- **type**: `unsigned int:1`
  If set, then this control has type `V4L2_CTRL_TYPE_STRING`.

**is_ptr**
- **type**: `unsigned int:1`
  If set, then this control is an array and/or has type `>= V4L2_CTRL_COMPOUND_TYPES` and/or has type `V4L2_CTRL_TYPE_STRING`. In other words, `struct v4l2_ext_control` uses field `p` to point to the data.

**is_array**
- **type**: `unsigned int:1`
  If set, then this control contains an N-dimensional array.

**has_volatiles**
- **type**: `unsigned int:1`
  If set, then one or more members of the cluster are volatile. Drivers should never touch this flag.

**call_notify**
- **type**: `unsigned int:1`
If set, then call the handler’s notify function whenever the control’s value changes.

**manual_mode_value**

- **type**: unsigned int: 8
  
  If the is_auto flag is set, then this is the value of the auto control that determines if that control is in manual mode. So if the value of the auto control equals this value, then the whole cluster is in manual mode. Drivers should never set this flag directly.

**ops**

- **type**: const struct v4l2_ctrl_ops *
  
  The control ops.

**type_ops**

- **type**: const struct v4l2_ctrl_type_ops *
  
  The control type ops.

**id**

- **type**: u32
  
  The control ID.

**name**

- **type**: const char *
  
  The control name.

**type**

- **type**: enum v4l2_ctrl_type
  
  The control type.

**minimum**

- **type**: s64
  
  The control’s minimum value.

**maximum**

- **type**: s64
  
  The control’s maximum value.

**default_value**

- **type**: s64
  
  The control’s default value.

**elems**

- **type**: u32
  
  The number of elements in the N-dimensional array.

**elem_size**

- **type**: u32
  
  The size in bytes of the control.

**dims[V4L2_CTRL_MAX_DIMS]**

- **type**: u32
  
  The size of each dimension.

**nr_of_dims**
• **type**: u32
  The number of dimensions in `dims`.

cur
  • **type**: union
  The control’s current value.

p_new
  • **type**: union `v4l2_ctrl_ptr`
  The control’s new value represented via an union with provides a standard way of accessing control types through a pointer.

p_cur
  • **type**: union `v4l2_ctrl_ptr`
  The control’s current value represented via an union with provides a standard way of accessing control types through a pointer.

struct `v4l2_ctrl_ref`
  The control reference.

**Definition**

```
struct v4l2_ctrl_ref {
    struct list_head node;
    struct v4l2_ctrl_ref * next;
    struct v4l2_ctrl * ctrl;
    struct v4l2_ctrl_helper * helper;
};
```

**Members**

**node**
  • **type**: struct `list_head`
  List node for the sorted list.

**next**
  • **type**: struct `v4l2_ctrl_ref`
  Single-link list node for the hash.

**ctrl**
  • **type**: struct `v4l2_ctrl`
  The actual control information.

**helper**
  • **type**: struct `v4l2_ctrl_helper`
  Pointer to helper struct. Used internally in `prepare_extCtrls()`.

**Description**

Each control handler has a list of these refs. The `list_head` is used to keep a sorted-by-control-ID list of all controls, while the next pointer is used to link the control in the hash’s bucket.

**struct v4l2_ctrl_handler**
  The control handler keeps track of all the controls: both the controls owned by the handler and those inherited from other handlers.
struct v4l2_ctrl_handler {
    struct mutex _lock;
    struct mutex * lock;
    struct list_head ctrls;
    struct list_head ctrl_refs;
    struct v4l2_ctrl_ref * cached;
    struct v4l2_ctrl_ref ** buckets;
    v4l2_ctrl_notify_fnc notify;
    void * notify_priv;
    u16 nr_of_buckets;
    int error;
};

Members

_lock
  • **type**: struct mutex
    Default for “lock”.

lock
  • **type**: struct mutex *
    Lock to control access to this handler and its controls. May be replaced by the user right after init.

ctrls
  • **type**: struct list_head
    The list of controls owned by this handler.

ctrl_refs
  • **type**: struct list_head
    The list of control references.

cached
  • **type**: struct v4l2_ctrl_ref *
    The last found control reference. It is common that the same control is needed multiple times, so this is a simple optimization.

buckets
  • **type**: struct v4l2_ctrl_ref **
    Buckets for the hashing. Allows for quick control lookup.

notify
  • **type**: v4l2_ctrl_notify_fnc
    A notify callback that is called whenever the control changes value. Note that the handler’s lock is held when the notify function is called!

notify_priv
  • **type**: void *
    Passed as argument to the v4l2_ctrl notify callback.

nr_of_buckets
  • **type**: u16
    Total number of buckets in the array.

error
**type**: int

The error code of the first failed control addition.

```c
struct v4l2_ctrl_config
    Control configuration structure.

**Definition**

```c
struct v4l2_ctrl_config {
    const struct v4l2_ctrl_ops * ops;
    const struct v4l2_ctrl_type_ops * type_ops;
    u32 id;
    const char * name;
    enum v4l2_ctrl_type type;
    s64 min;
    s64 max;
    u64 step;
    s64 def;
    u32 dims[V4L2_CTRL_MAX_DIMS];
    u32 elem_size;
    u32 flags;
    u64 menu_skip_mask;
    const char *const * qmenu;
    const s64 * qmenu_int;
    unsigned int is_private:1;
};
```

**Members**

**ops**

- **type**: const struct v4l2_ctrl_ops *
  The control ops.

**type_ops**

- **type**: const struct v4l2_ctrl_type_ops *
  The control type ops. Only needed for compound controls.

**id**

- **type**: u32
  The control ID.

**name**

- **type**: const char *
  The control name.

**type**

- **type**: enum v4l2_ctrl_type
  The control type.

**min**

- **type**: s64
  The control’s minimum value.

**max**

- **type**: s64
  The control’s maximum value.
step
  • type: u64
  
The control’s step value for non-menu controls.

def
  • type: s64
  
The control’s default value.

dims[V4L2_CTRL_MAX_DIMS]
  • type: u32
  
The size of each dimension.

elem_size
  • type: u32
  
The size in bytes of the control.

flags
  • type: u32
  
The control’s flags.

menu_skip_mask
  • type: u64
  
The control’s skip mask for menu controls. This makes it easy to skip menu items that are not valid. If bit X is set, then menu item X is skipped. Of course, this only works for menus with <= 64 menu items. There are no menus that come close to that number, so this is OK. Should we ever need more, then this will have to be extended to a bit array.

qmenu
  • type: const char *const *
  
  A const char * array for all menu items. Array entries that are empty strings ("") correspond to non-existing menu items (this is in addition to the menu_skip_mask above). The last entry must be NULL.

qmenu_int
  • type: const s64 *
  
  A const s64 integer array for all menu items of the type V4L2_CTRL_TYPE_INTEGER_MENU.

is_private
  • type: unsigned int:1
  
  If set, then this control is private to its handler and it will not be added to any other handlers.

void v4l2_ctrl_fill(u32 id, const char ** name, enum v4l2_ctrl_type * type, s64 * min, s64 * max, 
  u64 * step, s64 * def, u32 * flags)
  
  Fill in the control fields based on the control ID.

Parameters

u32 id ID of the control

const char ** name name of the control

enum v4l2_ctrl_type * type type of the control

s64 * min minimum value for the control

s64 * max maximum value for the control
u64 * step control step
s64 * def default value for the control
u32 * flags flags to be used on the control

Description
This works for all standard V4L2 controls. For non-standard controls it will only fill in the given arguments
and name will be NULL.

This function will overwrite the contents of name, type and flags. The contents of min, max, step and
def may be modified depending on the type.

Note:
Do not use in drivers! It is used internally for backwards compatibility control handling only. Once all
drivers are converted to use the new control framework this function will no longer be exported.

int v4l2_ctrl_handler_init_class(struct v4l2_ctrl_handler * hdl, unsigned int nr_of_controls_hint, struct lock_class_key * key, const char * name)
Initialize the control handler.

Parameters
struct v4l2_ctrl_handler * hdl The control handler.
unsigned int nr_of_controls_hint A hint of how many controls this handler is expected to refer to.
This is the total number, so including any inherited controls. It doesn’t have to be precise, but if
it is way off, then you either waste memory (too many buckets are allocated) or the control lookup
becomes slower (not enough buckets are allocated, so there are more slow list lookups). It will always
work, though.
struct lock_class_key * key Used by the lock validator if CONFIG_LOCKDEP is set.
const char * name Used by the lock validator if CONFIG_LOCKDEP is set.

Description
Returns an error if the buckets could not be allocated. This error will also be stored in hdl->error.
Never use this call directly, always use the v4l2_ctrl_handler_init macro that hides the key and name
arguments.

void v4l2_ctrl_handler_free(struct v4l2_ctrl_handler * hdl)
Free all controls owned by the handler and free the control list.

Parameters
struct v4l2_ctrl_handler * hdl The control handler.

Description
Does nothing if hdl == NULL.

void v4l2_ctrl_lock(struct v4l2_ctrl * ctrl)
Helper function to lock the handler associated with the control.

Parameters
struct v4l2_ctrl * ctrl The control to lock.

void v4l2_ctrl_unlock(struct v4l2_ctrl * ctrl)
Helper function to unlock the handler associated with the control.

Parameters
struct v4l2_ctrl * ctrl The control to unlock.
int v4l2_ctrl_handler_setup(struct v4l2_ctrl_handler * hd)
    Call the s_ctrl op for all controls belonging to the handler to initialize the hardware to the current
    control values.

Parameters
struct v4l2_ctrl_handler * hd  The control handler.

Description
Button controls will be skipped, as are read-only controls.
If hd == NULL, then this just returns 0.

void v4l2_ctrl_handler_log_status(struct v4l2_ctrl_handler * hd, const char * prefix)
    Log all controls owned by the handler.

Parameters
struct v4l2_ctrl_handler * hd  The control handler.
const char * prefix  The prefix to use when logging the control values. If the prefix does not end with
        a space, then " : " will be added after the prefix. If prefix == NULL, then no prefix will be used.

Description
For use with VIDIOC_LOG_STATUS.
Does nothing if hd == NULL.

struct v4l2_ctrl * v4l2_ctrl_new_custom(struct v4l2_ctrl_handler * hd, const struct v4l2_ctrl_config * cfg,
        void * priv)
    Allocate and initialize a new custom V4L2 control.

Parameters
struct v4l2_ctrl_handler * hd  The control handler.
const struct v4l2_ctrl_config * cfg The control’s configuration data.
void * priv  The control’s driver-specific private data.

Description
If the v4l2_ctrl struct could not be allocated then NULL is returned and hd->error is set to the error
code (if it wasn’t set already).

struct v4l2_ctrl * v4l2_ctrl_new_std(struct v4l2_ctrl_handler * hd, const struct v4l2_ctrl_ops *
        ops, u32 id, s64 min, s64 max, u64 step, s64 def)
    Allocate and initialize a new standard V4L2 non-menu control.

Parameters
struct v4l2_ctrl_handler * hd  The control handler.
const struct v4l2_ctrl_ops * ops The control ops.
u32 id  The control ID.
s64 min  The control’s minimum value.
s64 max  The control’s maximum value.
u64 step  The control’s step value
s64 def  The control’s default value.

Description
If the v4l2_ctrl struct could not be allocated, or the control ID is not known, then NULL is returned and
hd->error is set to the appropriate error code (if it wasn’t set already).
If id refers to a menu control, then this function will return NULL.
Use `v4l2_ctrl_new_std_menu()` when adding menu controls.

```c
def v4l2_ctrl_new_std_menu(struct v4l2_ctrl_handler * hdl, const struct v4l2_ctrl_ops * ops, u32 id, u8 max, u64 mask, u8 def)
```

Allocate and initialize a new standard V4L2 menu control.

---

**Parameters**

- `struct v4l2_ctrl_handler * hdl` The control handler.
- `const struct v4l2_ctrl_ops * ops` The control ops.
- `u32 id` The control ID.
- `u8 max` The control’s maximum value.
- `u64 mask` The control’s skip mask for menu controls. This makes it easy to skip menu items that are not valid. If bit X is set, then menu item X is skipped. Of course, this only works for menus with <= 64 menu items. There are no menus that come close to that number, so this is OK. Should we ever need more, then this will have to be extended to a bit array.
- `u8 def` The control’s default value.

**Description**

Same as `v4l2_ctrl_new_std()`, but `min` is set to 0 and the `mask` value determines which menu items are to be skipped.

If `id` refers to a non-menu control, then this function will return NULL.

```c
def v4l2_ctrl_new_std_menu_items(struct v4l2_ctrl_handler * hdl, const struct v4l2_ctrl_ops * ops, u32 id, u8 max, u64 mask, u8 def, const char *const * qmenu)
```

Create a new standard V4L2 menu control with driver specific menu.

---

**Parameters**

- `struct v4l2_ctrl_handler * hdl` The control handler.
- `const struct v4l2_ctrl_ops * ops` The control ops.
- `u32 id` The control ID.
- `u8 max` The control’s maximum value.
- `u64 mask` The control’s skip mask for menu controls. This makes it easy to skip menu items that are not valid. If bit X is set, then menu item X is skipped. Of course, this only works for menus with <= 64 menu items. There are no menus that come close to that number, so this is OK. Should we ever need more, then this will have to be extended to a bit array.
- `u8 def` The control’s default value.
- `const char *const * qmenu` The new menu.

**Description**

Same as `v4l2_ctrl_new_std_menu()`, but `qmenu` will be the driver specific menu of this control.

```c
def v4l2_ctrl_new_int_menu(struct v4l2_ctrl_handler * hdl, const struct v4l2_ctrl_ops * ops, u32 id, u8 max, u8 def, const s64 * qmenu_int)
```

Create a new standard V4L2 integer menu control.

---

**Parameters**

- `struct v4l2_ctrl_handler * hdl` The control handler.
- `const struct v4l2_ctrl_ops * ops` The control ops.
- `u32 id` The control ID.
- `u8 max` The control’s maximum value.
- `u8 def` The control’s default value.

---

2.1. Video2Linux devices
const s64 * qmenu_int  The control’s menu entries.

**Description**

Same as `v4l2_ctrl_new_std_menu()`, but **mask** is set to 0 and it additionally takes as an argument an array of integers determining the menu items.

If **id** refers to a non-integer-menu control, then this function will return NULL.

```c
int v4l2_ctrl_add_handler(struct v4l2_ctrl_handler * hdl, struct v4l2_ctrl_handler * add, v4l2_ctrl_filter filter)
```

Add all controls from handler **add** to handler **hdl**.

**Parameters**

- **struct v4l2_ctrl_handler * hdl**  The control handler.
- **struct v4l2_ctrl_handler * add**  The control handler whose controls you want to add to the **hdl** control handler.
- **v4l2_ctrl_filter filter**  This function will filter which controls should be added.

**Description**

Does nothing if either of the two handlers is a NULL pointer. If **filter** is NULL, then all controls are added. Otherwise only those controls for which **filter** returns true will be added. In case of an error **hdl**->error will be set to the error code (if it wasn’t set already).

```c
bool v4l2_ctrl_radio_filter(const struct v4l2_ctrl * ctrl)
```

Standard filter for radio controls.

**Parameters**

- **const struct v4l2_ctrl * ctrl**  The control that is filtered.

**Description**

This will return true for any controls that are valid for radio device nodes. Those are all of the V4L2_CID_AUDIO_* user controls and all FM transmitter class controls.

This function is to be used with `v4l2_ctrl_add_handler()`.

```c
void v4l2_ctrl_cluster(unsigned int ncontrols, struct v4l2_ctrl ** controls)
```

Mark all controls in the cluster as belonging to that cluster.

**Parameters**

- **unsigned int ncontrols**  The number of controls in this cluster.
- **struct v4l2_ctrl ** controls**  The cluster control array of size **ncontrols**.

```c
void v4l2_ctrl_auto_cluster(unsigned int ncontrols, struct v4l2_ctrl ** controls, u8 manual_val, bool set_volatile)
```

Mark all controls in the cluster as belonging to that cluster and set it up for autofoo/foo-type handling.

**Parameters**

- **unsigned int ncontrols**  The number of controls in this cluster.
- **struct v4l2_ctrl ** controls**  The cluster control array of size **ncontrols**. The first control must be the ‘auto’ control (e.g. autogain, autoexposure, etc.)
- **u8 manual_val**  The value for the first control in the cluster that equals the manual setting.
- **bool set_volatile**  If true, then all controls except the first auto control will be volatile.

**Description**

Use for control groups where one control selects some automatic feature and the other controls are only active whenever the automatic feature is turned off (manual mode). Typical examples: autogain vs gain, auto-whitebalance vs red and blue balance, etc.

The behavior of such controls is as follows:
When the autofoo control is set to automatic, then any manual controls are set to inactive and any reads will call g_volatile_ctrl (if the control was marked volatile).

When the autofoo control is set to manual, then any manual controls will be marked active, and any reads will just return the current value without going through g_volatile_ctrl.

In addition, this function will set the V4L2_CTRL_FLAG_UPDATE flag on the autofoo control and V4L2_CTRL_FLAG_INACTIVE on the foo control(s) if autofoo is in auto mode.

```c
struct v4l2_ctrl * v4l2_ctrl_find(struct v4l2_ctrl_handler * hdl, u32 id)
```

Find a control with the given ID.

**Parameters**

- `struct v4l2_ctrl_handler * hdl` The control handler.
- `u32 id` The control ID to find.

**Description**

If `hdl` == NULL this will return NULL as well. Will lock the handler so do not use from inside `v4l2_ctrl_ops`.

```c
void v4l2_ctrl_activate(struct v4l2_ctrl * ctrl, bool active)
```

Make the control active or inactive.

**Parameters**

- `struct v4l2_ctrl * ctrl` The control to (de)activate.
- `bool active` True if the control should become active.

**Description**

This sets or clears the V4L2_CTRL_FLAG_INACTIVE flag atomically. Does nothing if `ctrl` == NULL. This will usually be called from within the s_ctrl op. The V4L2_EVENT_CTRL event will be generated afterwards.

This function assumes that the control handler is locked.

```c
void v4l2_ctrl_grab(struct v4l2_ctrl * ctrl, bool grabbed)
```

Mark the control as grabbed or not grabbed.

**Parameters**

- `struct v4l2_ctrl * ctrl` The control to (de)activate.
- `bool grabbed` True if the control should become grabbed.

**Description**

This sets or clears the V4L2_CTRL_FLAG_GRABBED flag atomically. Does nothing if `ctrl` == NULL. The V4L2_EVENT_CTRL event will be generated afterwards. This will usually be called when starting or stopping streaming in the driver.

This function assumes that the control handler is not locked and will take the lock itself.

```c
int __v4l2_ctrl_modify_range(struct v4l2_ctrl * ctrl, s64 min, s64 max, u64 step, s64 def)
```

Unlocked variant of `v4l2_ctrl_modify_range()`.

**Parameters**

- `struct v4l2_ctrl * ctrl` The control to update.
- `s64 min` The control’s minimum value.
- `s64 max` The control’s maximum value.
- `u64 step` The control’s step value
- `s64 def` The control’s default value.
Description
Update the range of a control on the fly. This works for control types INTEGER, BOOLEAN, MENU, INTEGER MENU and BITMASK. For menu controls the `step` value is interpreted as a menu_skip_mask.
An error is returned if one of the range arguments is invalid for this control type.
This function assumes that the control handler is not locked and will take the lock itself.

```c
int v4l2_ctrl_modify_range(struct v4l2_ctrl * ctrl, s64 min, s64 max, u64 step, s64 def)
```
Update the range of a control.

Parameters
- `struct v4l2_ctrl * ctrl` The control to update.
- `s64 min` The control’s minimum value.
- `s64 max` The control’s maximum value.
- `u64 step` The control’s step value
- `s64 def` The control’s default value.

Description
Update the range of a control on the fly. This works for control types INTEGER, BOOLEAN, MENU, INTEGER MENU and BITMASK. For menu controls the `step` value is interpreted as a menu_skip_mask.
An error is returned if one of the range arguments is invalid for this control type.
This function assumes that the control handler is not locked and will take the lock itself.

```c
void v4l2_ctrl_notify(struct v4l2_ctrl * ctrl, v4l2_ctrl_notify_fnc notify, void * priv)
```
Function to set a notify callback for a control.

Parameters
- `struct v4l2_ctrl * ctrl` The control.
- `v4l2_ctrl_notify_fnc notify` The callback function.
- `void * priv` The callback private handle, passed as argument to the callback.

Description
This function sets a callback function for the control. If `ctrl` is NULL, then it will do nothing. If `notify` is NULL, then the notify callback will be removed.
There can be only one notify. If another already exists, then a WARN_ON will be issued and the function will do nothing.

```c
const char * v4l2_ctrl_get_name(u32 id)
```
Get the name of the control

Parameters
- `u32 id` The control ID.

Description
This function returns the name of the given control ID or NULL if it isn’t a known control.

```c
const char * v4l2_ctrl_get_menu(u32 id)
```
Get the menu string array of the control

Parameters
- `u32 id` The control ID.

Description
This function returns the NULL-terminated menu string array name of the given control ID or NULL if it isn’t a known menu control.
const s64 *v4l2_ctrl_get_int_menu(u32 id, u32 *len)
    Get the integer menu array of the control

Parameters
u32 id The control ID.
u32 * len The size of the integer array.

Description
This function returns the integer array of the given control ID or NULL if it if isn’t a known integer menu control.

s32 v4l2_ctrl_g_ctrl(struct v4l2_ctrl *ctrl)
    Helper function to get the control’s value from within a driver.

Parameters
struct v4l2_ctrl * ctrl The control.

Description
This returns the control’s value safely by going through the control framework. This function will lock the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.

This function is for integer type controls only.

int __v4l2_ctrl_s_ctrl(struct v4l2_ctrl * ctrl, s32 val)
    Unlocked variant of v4l2_ctrl_s_ctrl().

Parameters
struct v4l2_ctrl * ctrl The control.
s32 val The control’s new value.

Description
This sets the control’s new value safely by going through the control framework. This function assumes the control’s handler is already locked, allowing it to be used from within the v4l2_ctrl_ops functions.

This function is for integer type controls only.

int v4l2_ctrl_s_ctrl(struct v4l2_ctrl * ctrl, s32 val)
    Helper function to set the control’s value from within a driver.

Parameters
struct v4l2_ctrl * ctrl The control.
s32 val The new value.

Description
This sets the control’s new value safely by going through the control framework. This function will lock the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.

This function is for integer type controls only.

s64 v4l2_ctrl_g_ctrl_int64(struct v4l2_ctrl *ctrl)
    Helper function to get a 64-bit control’s value from within a driver.

Parameters
struct v4l2_ctrl * ctrl The control.

Description
This returns the control’s value safely by going through the control framework. This function will lock the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.

This function is for 64-bit integer type controls only.
int __v4l2_ctrl_s_ctrl_int64(struct v4l2_ctrl * ctrl, s64 val)
  Unlocked variant of v4l2_ctrl_s_ctrl_int64().

Parameters
struct v4l2_ctrl * ctrl The control.
s64 val The new value.

Description
This sets the control’s new value safely by going through the control framework. This function assumes
the control’s handler is already locked, allowing it to be used from within the v4l2_ctrl_ops functions.
This function is for 64-bit integer type controls only.

int v4l2_ctrl_s_ctrl_int64(struct v4l2_ctrl * ctrl, s64 val)
  Helper function to set a 64-bit control’s value from within a driver.

Parameters
struct v4l2_ctrl * ctrl The control.
s64 val The new value.

Description
This sets the control’s new value safely by going through the control framework. This function will lock
the control’s handler, so it cannot be used from within the v4l2_ctrl_ops functions.
This function is for 64-bit integer type controls only.

int __v4l2_ctrl_s_ctrl_string(struct v4l2_ctrl * ctrl, const char * s)
  Unlocked variant of v4l2_ctrl_s_ctrl_string().

Parameters
struct v4l2_ctrl * ctrl The control.
const char * s The new string.

Description
This sets the control’s new string safely by going through the control framework. This function assumes
the control’s handler is already locked, allowing it to be used from within the v4l2_ctrl_ops functions.
This function is for string type controls only.

int v4l2_ctrl_s_ctrl_string(struct v4l2_ctrl * ctrl, const char * s)
  Helper function to set a control’s string value from within a driver.

Parameters
struct v4l2_ctrl * ctrl The control.
const char * s The new string. Controls name This sets the control’s new string safely by going through
the control framework. This function will lock the control’s handler, so it cannot be used from within
the v4l2_ctrl_ops functions.

Description
This function is for string type controls only.

void v4l2_ctrl_replace(struct v4l2_event * old, const struct v4l2_event * new)
  Function to be used as a callback to struct v4l2_subscribed_event_ops replace()

Parameters
struct v4l2_event * old pointer to struct v4l2_event with the reported event;
const struct v4l2_event * new pointer to struct v4l2_event with the modified event;

void v4l2_ctrl_merge(const struct v4l2_event * old, struct v4l2_event * new)
  Function to be used as a callback to struct v4l2_subscribed_event_ops merge()
Parameters

const struct v4l2_event * old  pointer to  struct v4l2_event  with the reported event;
struct v4l2_event * new  pointer to  struct v4l2_event  with the merged event;

int  v4l2 ctrl_log_status (struct file * file, void * fh)
    helper function to implement VIDI0C_LOG_STATUS ioctl

Parameters

struct file * file  pointer to struct file
void * fh unused. Kept just to be compatible to the arguments expected by  struct v4l2_ioctl_ops .vidioc_log_status.

Description

Can be used as a vidioc_log_status function that just dumps all controls associated with the filehandle.

int  v4l2 ctrl_subscribe_event (struct v4l2_fh * fh, const struct v4l2_event_subscription * sub)
    Subscribes to an event

Parameters

struct v4l2_fh * fh  pointer to struct v4l2_fh
const struct v4l2_event_subscription * sub  pointer to  struct v4l2_event_subscription

Description

Can be used as a vidioc_subscribe_event function that just subscribes control events.

unsigned int  v4l2 ctrl_poll (struct file * file, struct poll_table_struct * wait)
    function to be used as a callback to the poll() That just polls for control events.

Parameters

struct file * file  pointer to struct file
struct poll_table_struct * wait  pointer to struct poll_table_struct

int  v4l2_queryctrl (struct v4l2_ctrl_handler * hdl, struct v4l2_queryctrl * qc)
    Helper function to implement  VIDI0C_QUERYCTRL  ioctl

Parameters

struct v4l2_ctrl_handler * hdl  pointer to  struct v4l2_ctrl_handler
struct v4l2_queryctrl * qc  pointer to  struct v4l2_queryctrl

Description

If hdl == NULL then they will all return -EINVAL.

int  v4l2_query_ext_ctrl (struct v4l2_ctrl_handler * hdl, struct v4l2_query_ext_ctrl * qc)
    Helper function to implement  VIDI0C_QUERY_EXT_CTRL  ioctl

Parameters

struct v4l2_ctrl_handler * hdl  pointer to  struct v4l2_ctrl_handler
struct v4l2_query_ext_ctrl * qc  pointer to  struct v4l2_query_ext_ctrl

Description

If hdl == NULL then they will all return -EINVAL.

int  v4l2_querymenu (struct v4l2_ctrl_handler * hdl, struct v4l2_querymenu * qm)
    Helper function to implement  VIDI0C_QUERYMENU  ioctl

Parameters

struct v4l2_ctrl_handler * hdl  pointer to  struct v4l2_ctrl_handler
struct v4l2_querymenu * qm pointer to struct v4l2_querymenu

Description
If hdl == NULL then they will all return -EINVAL.

int v4l2_g_ctrl(struct v4l2_ctrl_handler * hdl, struct v4l2_control * ctrl)
    Helper function to implement VIDIOC_G_CTRL ioctl

Parameters
struct v4l2_ctrl_handler * hdl pointer to struct v4l2_ctrl_handler
struct v4l2_control * ctrl pointer to struct v4l2_control

Description
If hdl == NULL then they will all return -EINVAL.

int v4l2_s_ctrl(struct v4l2_fh * fh, struct v4l2_ctrl_handler * hdl, struct v4l2_control * ctrl)
    Helper function to implement VIDIOC_S_CTRL ioctl

Parameters
struct v4l2_fh * fh pointer to struct v4l2_fh
struct v4l2_ctrl_handler * hdl pointer to struct v4l2_ctrl_handler
struct v4l2_control * ctrl pointer to struct v4l2_control

Description
If hdl == NULL then they will all return -EINVAL.

int v4l2_g_extCtrls(struct v4l2_ctrl_handler * hdl, struct v4l2_ext_controls * c)
    Helper function to implement VIDIOC_G_EXT_CTRLS ioctl

Parameters
struct v4l2_ctrl_handler * hdl pointer to struct v4l2_ctrl_handler
struct v4l2_ext_controls * c pointer to struct v4l2_ext_controls

Description
If hdl == NULL then they will all return -EINVAL.

int v4l2_try_extCtrls(struct v4l2_ctrl_handler * hdl, struct v4l2_ext_controls * c)
    Helper function to implement VIDIOC_TRY_EXT_CTRLS ioctl

Parameters
struct v4l2_ctrl_handler * hdl pointer to struct v4l2_ctrl_handler
struct v4l2_ext_controls * c pointer to struct v4l2_ext_controls

Description
If hdl == NULL then they will all return -EINVAL.

int v4l2_s_extCtrls(struct v4l2_fh * fh, struct v4l2_ctrl_handler * hdl, struct v4l2_ext_controls * c)
    Helper function to implement VIDIOC_S_EXT_CTRLS ioctl

Parameters
struct v4l2_fh * fh pointer to struct v4l2_fh
struct v4l2_ctrl_handler * hdl pointer to struct v4l2_ctrl_handler
struct v4l2_ext_controls * c pointer to struct v4l2_ext_controls

Description
If hdl == NULL then they will all return -EINVAL.
int v4l2_ctrl_subdev_subscribe_event(struct v4l2_subdev *sd, struct v4l2_fh *fh, struct v4l2_event_subscription *sub)

Helper function to implement as a struct v4l2_subdev_core_ops subscribe_event function that just subscribes control events.

Parameters

struct v4l2_subdev * sd pointer to struct v4l2_subdev
struct v4l2_fh * fh pointer to struct v4l2_fh
struct v4l2_event_subscription * sub pointer to struct v4l2_event_subscription

int v4l2_ctrl_subdev_log_status(struct v4l2_subdev *sd)

Log all controls owned by subdev’s control handler.

Parameters

struct v4l2_subdev * sd pointer to struct v4l2_subdev

2.1.13 Videobuf Framework

Author: Jonathan Corbet <corbet@lwn.net>
Current as of 2.6.33

Note:

The videobuf framework was deprecated in favor of videobuf2. Shouldn’t be used on new drivers.

Introduction

The videobuf layer functions as a sort of glue layer between a V4L2 driver and user space. It handles the allocation and management of buffers for the storage of video frames. There is a set of functions which can be used to implement many of the standard POSIX I/O system calls, including read(), poll(), and, happily, mmap(). Another set of functions can be used to implement the bulk of the V4L2 ioctl() calls related to streaming I/O, including buffer allocation, queueing and dequeueing, and streaming control. Using videobuf imposes a few design decisions on the driver author, but the payback comes in the form of reduced code in the driver and a consistent implementation of the V4L2 user-space API.

Buffer types

Not all video devices use the same kind of buffers. In fact, there are (at least) three common variations:

• Buffers which are scattered in both the physical and (kernel) virtual address spaces. (Almost) all user-space buffers are like this, but it makes great sense to allocate kernel-space buffers this way as well when it is possible. Unfortunately, it is not always possible; working with this kind of buffer normally requires hardware which can do scatter/gather DMA operations.

• Buffers which are physically scattered, but which are virtually contiguous; buffers allocated with vmalloc(), in other words. These buffers are just as hard to use for DMA operations, but they can be useful in situations where DMA is not available but virtually-contiguous buffers are convenient.

• Buffers which are physically contiguous. Allocation of this kind of buffer can be unreliable on fragmented systems, but simpler DMA controllers cannot deal with anything else.

Videobuf can work with all three types of buffers, but the driver author must pick one at the outset and design the driver around that decision.

[It’s worth noting that there’s a fourth kind of buffer: “overlay” buffers which are located within the system’s video memory. The overlay functionality is considered to be deprecated for most use, but it
still shows up occasionally in system-on-chip drivers where the performance benefits merit the use of this technique. Overlay buffers can be handled as a form of scattered buffer, but there are very few implementations in the kernel and a description of this technique is currently beyond the scope of this document.

Data structures, callbacks, and initialization

Depending on which type of buffers are being used, the driver should include one of the following files:

```
<media/videobuf-dma-sg.h>  /* Physically scattered */
<media/videobuf-vmalloc.h>  /* vmalloc() buffers */
<media/videobuf-dma-contig.h>  /* Physically contiguous */
```

The driver’s data structure describing a V4L2 device should include a struct videobuf_queue instance for the management of the buffer queue, along with a list_head for the queue of available buffers. There will also need to be an interrupt-safe spinlock which is used to protect (at least) the queue.

The next step is to write four simple callbacks to help videobuf deal with the management of buffers:

```
struct videobuf_queue_ops {
    int (*buf_setup)(struct videobuf_queue *q,
                     unsigned int *count, unsigned int *size);
    int (*buf_prepare)(struct videobuf_queue *q,
                       struct videobuf_buffer *vb,
                       enum v4l2_field field);
    void (*buf_queue)(struct videobuf_queue *q,
                      struct videobuf_buffer *vb);
    void (*buf_release)(struct videobuf_queue *q,
                        struct videobuf_buffer *vb);
};
```

buf_setup() is called early in the I/O process, when streaming is being initiated; its purpose is to tell videobuf about the I/O stream. The count parameter will be a suggested number of buffers to use; the driver should check it for rationality and adjust it if need be. As a practical rule, a minimum of two buffers are needed for proper streaming, and there is usually a maximum (which cannot exceed 32) which makes sense for each device. The size parameter should be set to the expected (maximum) size for each frame of data.

Each buffer (in the form of a struct videobuf_buffer pointer) will be passed to buf_prepare(), which should set the buffer’s size, width, height, and field fields properly. If the buffer’s state field is VIDEOBUF_NEEDS_INIT, the driver should pass it to:

```
int videobuf_iolock(struct videobuf_queue* q, struct videobuf_buffer *vb,
                     struct v4l2_framebuffer *fbuf);
```

Among other things, this call will usually allocate memory for the buffer. Finally, the buf_prepare() function should set the buffer’s state to VIDEOBUF_PREPARED.

When a buffer is queued for I/O, it is passed to buf_queue(), which should put it onto the driver’s list of available buffers and set its state to VIDEOBUF_QUEUED. Note that this function is called with the queue spinlock held; if it tries to acquire it as well things will come to a screeching halt. Yes, this is the voice of experience. Note also that videobuf may want on the first buffer in the queue; placing other buffers in front of it could again gum up the works. So use list_add_tail() to enqueue buffers.

Finally, buf_release() is called when a buffer is no longer intended to be used. The driver should ensure that there is no I/O active on the buffer, then pass it to the appropriate free routine(s):

```
/* Scatter/gather drivers */
int videobuf_dma_unmap(struct videobuf_queue *q,
                       struct videobuf_dmbuf *dma);
int videobuf_dma_free(struct videobuf_dmbuf *dma);
```
/* vmalloc drivers */
void videobuf_vmalloc_free (struct videobuf_buffer *buf);

/* Contiguous drivers */
void videobuf_dma_contig_free(struct videobuf_queue *q,
    struct videobuf_buffer *buf);

One way to ensure that a buffer is no longer under I/O is to pass it to:

int videobuf_waiton(struct videobuf_buffer *vb, int non_blocking, int intr);

Here, vb is the buffer, non_blocking indicates whether non-blocking I/O should be used (it should be zero in the buf_release() case), and intr controls whether an interruptible wait is used.

File operations

At this point, much of the work is done; much of the rest is slipping videobuf calls into the implementation of the other driver callbacks. The first step is in the open() function, which must initialize the videobuf queue. The function to use depends on the type of buffer used:

void videobuf_queue_sg_init(struct videobuf_queue *q,
    struct videobuf_queue_ops *ops,
    struct device *dev,
    spinlock_t *irqlock,
    enum v4l2_buf_type type,
    enum v4l2_field field,
    unsigned int msize,
    void *priv);

void videobuf_queue_vmalloc_init(struct videobuf_queue *q,
    struct videobuf_queue_ops *ops,
    struct device *dev,
    spinlock_t *irqlock,
    enum v4l2_buf_type type,
    enum v4l2_field field,
    unsigned int msize,
    void *priv);

void videobuf_queue_dma_contig_init(struct videobuf_queue *q,
    struct videobuf_queue_ops *ops,
    struct device *dev,
    spinlock_t *irqlock,
    enum v4l2_buf_type type,
    enum v4l2_field field,
    unsigned int msize,
    void *priv);

In each case, the parameters are the same: q is the queue structure for the device, ops is the set of callbacks as described above, dev is the device structure for this video device, irqlock is an interrupt-safe spinlock to protect access to the data structures, type is the buffer type used by the device (cameras will use V4L2_BUF_TYPE_VIDEO_CAPTURE, for example), field describes which field is being captured (often V4L2_FIELD_NONE for progressive devices), msize is the size of any containing structure used around struct videobuf_buffer, and priv is a private data pointer which shows up in the priv_data field of struct videobuf_queue. Note that these are void functions which, evidently, are immune to failure.

V4L2 capture drivers can be written to support either of two APIs: the read() system call and the rather more complicated streaming mechanism. As a general rule, it is necessary to support both to ensure that all applications have a chance of working with the device. Videobuf makes it easy to do that with the same code. To implement read(), the driver need only make a call to one of:
ssize_t videobuf_read_one(struct videobuf_queue *q,  
    char __user *data, size_t count,  
    loff_t *ppos, int nonblocking);

ssize_t videobuf_read_stream(struct videobuf_queue *q,  
    char __user *data, size_t count,  
    loff_t *ppos, int vbihack, int nonblocking);

Either one of these functions will read frame data into data, returning the amount actually read; the  
difference is that videobuf_read_one() will only read a single frame, while videobuf_read_stream() will  
read multiple frames if they are needed to satisfy the count requested by the application. A typical driver  
read() implementation will start the capture engine, call one of the above functions, then stop the engine  
before returning (though a smarter implementation might leave the engine running for a little while in  
anticipation of another read() call happening in the near future).

The poll() function can usually be implemented with a direct call to:

unsigned int videobuf_poll_stream(struct file *file,  
    struct videobuf_queue *q,  
    poll_table *wait);

Note that the actual wait queue eventually used will be the one associated with the first available buffer.

When streaming I/O is done to kernel-space buffers, the driver must support the mmap() system call to  
enable user space to access the data. In many V4L2 drivers, the often-complex mmap() implementation  
simplifies to a single call to:

int videobuf_mmap_mapper(struct videobuf_queue *q,  
    struct vm_area_struct *vma);

Everything else is handled by the videobuf code.

The release() function requires two separate videobuf calls:

void videobuf_stop(struct videobuf_queue *q);  
int videobuf_mmap_free(struct videobuf_queue *q);

The call to videobuf_stop() terminates any I/O in progress - though it is still up to the driver to stop the  
capture engine. The call to videobuf_mmap_free() will ensure that all buffers have been unmapped; if  
so, they will all be passed to the buf_release() callback. If buffers remain mapped, videobuf_mmap_free()  
returns an error code instead. The purpose is clearly to cause the closing of the file descriptor to fail if  
buffers are still mapped, but every driver in the 2.6.32 kernel cheerfully ignores its return value.

ioctl() operations

The V4L2 API includes a very long list of driver callbacks to respond to the many ioctl() commands made  
available to user space. A number of these - those associated with streaming I/O - turn almost directly  
into videobuf calls. The relevant helper functions are:

int videobuf_reqbufs(struct videobuf_queue *q,  
    struct v4l2_requestbuffers *req);  
int videobuf_querybuf(struct videobuf_queue *q, struct v4l2_buffer *b);  
int videobuf_qbuf(struct videobuf_queue *q, struct v4l2_buffer *b);  
int videobuf_dqbuf(struct videobuf_queue *q, struct v4l2_buffer *b,  
    int nonblocking);  
int videobuf_streamon(struct videobuf_queue *q);  
int videobuf_streamoff(struct videobuf_queue *q);

So, for example, a VIDIOC_REQBUFS call turns into a call to the driver’s vidioc_reqbufs() callback  
which, in turn, usually only needs to locate the proper struct videobuf_queue pointer and pass it to  

videobuf_reqbufs(). These support functions can replace a great deal of buffer management boilerplate in a lot of V4L2 drivers.

The vidioc_streamon() and vidioc_streamoff() functions will be a bit more complex, of course, since they will also need to deal with starting and stopping the capture engine.

**Buffer allocation**

Thus far, we have talked about buffers, but have not looked at how they are allocated. The scatter/gather case is the most complex on this front. For allocation, the driver can leave buffer allocation entirely up to the videobuf layer; in this case, buffers will be allocated as anonymous user-space pages and will be very scattered indeed. If the application is using user-space buffers, no allocation is needed; the videobuf layer will take care of calling get_user_pages() and filling in the scatterlist array.

If the driver needs to do its own memory allocation, it should be done in the vidioc_reqbufs() function, after calling videobuf_reqbufs(). The first step is a call to:

```c
struct videobuf_dmabuf *videobuf_to_dma(struct videobuf_buffer *buf);
```

The returned videobuf_dmabuf structure (defined in `<media/videobuf-dma-sg.h>`) includes a couple of relevant fields:

```c
struct scatterlist *sglist;
int sglen;
```

The driver must allocate an appropriately-sized scatterlist array and populate it with pointers to the pieces of the allocated buffer; sglen should be set to the length of the array.

Drivers using the vmalloc() method need not (and cannot) concern themselves with buffer allocation at all; videobuf will handle those details. The same is normally true of contiguous-DMA drivers as well; videobuf will allocate the buffers (with dma_alloc_coherent()) when it sees fit. That means that these drivers may be trying to do high-order allocations at any time, an operation which is not always guaranteed to work. Some drivers play tricks by allocating DMA space at system boot time; videobuf does not currently play well with those drivers.

As of 2.6.31, contiguous-DMA drivers can work with a user-supplied buffer, as long as that buffer is physically contiguous. Normal user-space allocations will not meet that criterion, but buffers obtained from other kernel drivers, or those contained within huge pages, will work with these drivers.

**Filling the buffers**

The final part of a videobuf implementation has no direct callback - it's the portion of the code which actually puts frame data into the buffers, usually in response to interrupts from the device. For all types of drivers, this process works approximately as follows:

- Obtain the next available buffer and make sure that somebody is actually waiting for it.
- Get a pointer to the memory and put video data there.
- Mark the buffer as done and wake up the process waiting for it.

Step (1) above is done by looking at the driver-managed list_head structure - the one which is filled in the buf_queue() callback. Because starting the engine and enqueuing buffers are done in separate steps, it's possible for the engine to be running without any buffers available - in the vmalloc() case especially. So the driver should be prepared for the list to be empty. It is equally possible that nobody is yet interested in the buffer; the driver should not remove it from the list or fill it until a process is waiting on it. That test can be done by examining the buffer's done field (a wait_queue_head_t structure) with waitqueue_active().

A buffer's state should be set to VIDEobuf_ACTIVE before being mapped for DMA; that ensures that the videobuf layer will not try to do anything with it while the device is transferring data.
For scatter/gather drivers, the needed memory pointers will be found in the scatterlist structure described above. Drivers using the vmalloc() method can get a memory pointer with:

```c
void *videobuf_to_vmalloc(struct videobuf_buffer *buf);
```

For contiguous DMA drivers, the function to use is:

```c
dma_addr_t videobuf_to_dma_contig(struct videobuf_buffer *buf);
```

The contiguous DMA API goes out of its way to hide the kernel-space address of the DMA buffer from drivers.

The final step is to set the size field of the relevant videobuf_buffer structure to the actual size of the captured image, set state to VIDEOBUF_DONE, then call wake_up() on the done queue. At this point, the buffer is owned by the videobuf layer and the driver should not touch it again.

Developers who are interested in more information can go into the relevant header files; there are a few low-level functions declared there which have not been talked about here. Also worthwhile is the vivi driver (drivers/media/platform/vivi.c), which is maintained as an example of how V4L2 drivers should be written. Vivi only uses the vmalloc() API, but it's good enough to get started with. Note also that all of these calls are exported GPL-only, so they will not be available to non-GPL kernel modules.

### 2.1.14 V4L2 videobuf2 functions and data structures

```c
struct vb2_mem_ops
{
  memory handling/memory allocator operations

  Definition
```

```c
  struct vb2_mem_ops {
    void (*alloc) (struct device *dev, unsigned long attrs,unsigned long size, enum dma_data_direction dma_dir,gfp_t gfp_flags);
    void (*put) (void *buf_priv);
    struct dma_buf *(*get_dmabuf) (void *buf_priv, unsigned long flags);
    void *(*get_userptr) (struct device *dev, unsigned long vaddr,unsigned long size,enum dma_data_direction dma_dir);
    void (*put_userptr) (void *buf_priv);
    void (*prepare) (void *buf_priv);
    void (*finish) (void *buf_priv);
    void *(*attach_dmabuf) (struct device *dev, struct dma_buf *dbuf,unsigned long size,enum dma_data_direction dma_dir);
    void (*detach_dmabuf) (void *buf_priv);
    int (*map_dmabuf) (void *buf_priv);
    void (*unmap_dmabuf) (void *buf_priv);
    void *(*vaddr) (void *buf_priv);
    void *(*cookie) (void *buf_priv);
    unsigned int (*num_users) (void *buf_priv);
    int (*mmap) (void *buf_priv, struct vm_area_struct *vma);
  };
```

```c
Members
```

```c
alloc
  • type: void (*)(struct device *dev, unsigned long attrs, unsigned long size, enum dma_data_direction dma_dir, gfp_t gfp_flags)
```

allocate video memory and, optionally, allocator private data, return NULL on failure or a pointer to allocator private, per-buffer data on success; the returned private structure will then be passed as buf_priv argument to other ops in this structure. Additional gfp_flags to use when allocating the are also passed to this operation. These flags are from the gfp_flags field of vb2_queue.

```c
put
```
• **type**: `void (*)(void *buf_priv)`
inform the allocator that the buffer will no longer be used; usually will result in the allocator freeing the buffer (if no other users of this buffer are present); the `buf_priv` argument is the allocator private per-buffer structure previously returned from the alloc callback.

**get_dmabuf**
• **type**: `struct dma_buf *(*)(void *buf_priv,unsigned long flags)`
acquire userspace memory for a hardware operation; used for DMABUF memory types.

**get_userptr**
• **type**: `void (*)(struct device *dev,unsigned long vaddr,unsigned long size,enum dma_data_direction dma_dir)`
acquire userspace memory for a hardware operation; used for USERPTR memory types; `vaddr` is the address passed to the videobuf layer when queuing a video buffer of USERPTR type; should return an allocator private per-buffer structure associated with the buffer on success, NULL on failure; the returned private structure will then be passed as `buf_priv` argument to other ops in this structure.

**put_userptr**
• **type**: `void (*)(void *buf_priv)`
inform the allocator that a USERPTR buffer will no longer be used.

**prepare**
• **type**: `void (*)(void *buf_priv)`
called every time the buffer is passed from userspace to the driver, useful for cache synchronisation, optional.

**finish**
• **type**: `void (*)(void *buf_priv)`
called every time the buffer is passed back from the driver to the userspace, also optional.

**attach_dmabuf**
• **type**: `void (*)(struct device *dev,struct dma_buf *dbuf,unsigned long size,enum dma_data_direction dma_dir)`
attach a shared struct dma_buf for a hardware operation; used for DMABUF memory types; `dev` is the alloc device `dbuf` is the shared dma_buf; returns NULL on failure; allocator private per-buffer structure on success; this needs to be used for further accesses to the buffer.

**detach_dmabuf**
• **type**: `void (*)(void *buf_priv)`
inform the exporter of the buffer that the current DMABUF buffer is no longer used; the `buf_priv` argument is the allocator private per-buffer structure previously returned from the attach_dmabuf callback.

**map_dmabuf**
• **type**: `int (*)(void *buf_priv)`
request for access to the dmabuf from allocator; the allocator of dmabuf is informed that this driver is going to use the dmabuf.

**unmap_dmabuf**
• **type**: `void (*)(void *buf_priv)`
releases access control to the dmabuf - allocator is notified that this driver is done using the dmabuf for now.

vaddr

**2.1. Video2Linux devices**
type: void (*)(void *buf_priv)

return a kernel virtual address to a given memory buffer associated with the passed private structure
or NULL if no such mapping exists.

cookie

• type: void (*)(void *buf_priv)

return allocator specific cookie for a given memory buffer associated with the passed private structure
or NULL if not available.

num_users

• type: unsigned int (*)(void *buf_priv)

return the current number of users of a memory buffer; return 1 if the videobuf layer (or actually the
driver using it) is the only user.

mmap

• type: int (*)(void *buf_priv, struct vm_area_struct *vma)

setup a userspace mapping for a given memory buffer under the provided virtual memory region.

Description

Those operations are used by the videobuf2 core to implement the memory handling/memory allocators
for each type of supported streaming I/O method.

Note:

1. Required ops for USERPTR types: get_userptr, put_userptr.
2. Required ops for MMAP types: alloc, put, num_users, mmap.
3. Required ops for read/write access types: alloc, put, num_users, vaddr.
4. Required ops for DMABUF types: attach_dmabuf, detach_dmabuf, map_dmabuf, unmap_dmabuf.

struct vb2_plane

plane information

Definition

struct vb2_plane {

    struct dma_buf * dbuf;
    unsigned int dbuf_mapped;
    unsigned int bytesused;
    unsigned int length;
    unsigned int min_length;
    union m;
    unsigned int data_offset;
};

Members

mem_priv

• type: void *

private data with this plane

dbuf

• type: struct dma_buf *

dma_buf - shared buffer object

dbuf_mapped
• **type**: unsigned int
  flag to show whether dbuf is mapped or not

**bytesused**
• **type**: unsigned int
  number of bytes occupied by data in the plane (payload)

**length**
• **type**: unsigned int
  size of this plane (NOT the payload) in bytes

**min_length**
• **type**: unsigned int
  minimum required size of this plane (NOT the payload) in bytes. **length** is always greater or equal to **min_length**.

**m**
• **type**: union
  Union with memtype-specific data (**offset**, **userptr** or **fd**).

**data_offset**
• **type**: unsigned int
  offset in the plane to the start of data; usually 0, unless there is a header in front of the data. Should contain enough information to be able to cover all the fields of struct `v4l2_plane` at `videodev2.h`.

**enum vb2_io_modes**
queue access methods

**Constants**

**VB2_MMAP** driver supports MMAP with streaming API
**VB2_USERPRTR** driver supports USERPTR with streaming API
**VB2_READ** driver supports `read()` style access
**VB2_WRITE** driver supports `write()` style access
**VB2_DMABUF** driver supports DMABUF with streaming API

**enum vb2_buffer_state**
current video buffer state

**Constants**

**VB2_BUF_STATE_DEQUEUED** buffer under userspace control
**VB2_BUF_STATE_PREPARING** buffer is being prepared in videobuf
**VB2_BUF_STATE_PREPARED** buffer prepared in videobuf and by the driver
**VB2_BUF_STATE_QUEUED** buffer queued in videobuf, but not in driver
**VB2_BUF_STATE_REQUEUEING** re-queue a buffer to the driver
**VB2_BUF_STATE_ACTIVE** buffer queued in driver and possibly used in a hardware operation
**VB2_BUF_STATE_DONE** buffer returned from driver to videobuf, but not yet dequeued to userspace
**VB2_BUF_STATE_ERROR** same as above, but the operation on the buffer has ended with an error, which will be reported to the userspace when it is dequeued

**struct vb2_buffer**
represents a video buffer
**Definition**

```c
definition
struct vb2_buffer {
    struct vb2_queue * vb2_queue;
    unsigned int index;
    unsigned int type;
    unsigned int memory;
    unsigned int num_planes;
    struct vb2_plane planes[VB2_MAX_PLANES];
    u64 timestamp;
};
```

**Members**

- **vb2_queue**
  - **type**: struct vb2_queue *
    - the queue to which this driver belongs

- **index**
  - **type**: unsigned int
    - id number of the buffer

- **type**
  - **type**: unsigned int
    - buffer type

- **memory**
  - **type**: unsigned int
    - the method, in which the actual data is passed

- **num_planes**
  - **type**: unsigned int
    - number of planes in the buffer on an internal driver queue

- **planes[VB2_MAX_PLANES]**
  - **type**: struct vb2_plane
    - private per-plane information; do not change

- **timestamp**
  - **type**: u64
    - frame timestamp in ns

**Definition**

```c
definition
struct vb2_ops {
    int (* queue_setup) (struct vb2_queue *q,unsigned int *num_buffers, unsigned int *num_planes,unsigned int sizes[], struct device *alloc_devs[]);
    void (* wait_prepare) (struct vb2_queue *q);
    void (* wait_finish) (struct vb2_queue *q);
    int (* buf_init) (struct vb2_buffer *vb);
    int (* buf_prepare) (struct vb2_buffer *vb);
    void (* buf_cleanup) (struct vb2_buffer *vb);
    int (* start_streaming) (struct vb2_queue *q, unsigned int count);
};
```
void (* stop_streaming) (struct vb2_queue *q);
void (* buf_queue) (struct vb2_buffer *vb);
}

Members

queue_setup

• type: int (*)(struct vb2_queue *q, unsigned int *num_buffers, unsigned int *num_planes, unsigned int sizes[], struct device *alloc_devs[])

called from VIDIOC_REQBUFS and VIDIOC_CREATE_BUFS handlers before memory allocation. It can be called twice: if the original number of requested buffers could not be allocated, then it will be called a second time with the actually allocated number of buffers to verify if that is OK. The driver should return the required number of buffers in *num_buffers, the required number of planes per buffer in *num_planes, the size of each plane should be set in the sizes[] array and optional per-plane allocator specific device in the alloc_devs[] array. When called from VIDIOC_REQBUFS, *num_planes == 0, the driver has to use the currently configured format to determine the plane sizes and *num_buffers is the total number of buffers that are being allocated. When called from VIDIOC_CREATE_BUFS, *num_planes != 0 and it describes the requested number of planes and sizes[] contains the requested plane sizes. If either *num_planes or the requested sizes are invalid callback must return -EINVAL.

In this case *num_buffers are being allocated additionally to q->num_buffers.

wait_prepare

• type: void (*)(struct vb2_queue *q)

release any locks taken while calling vb functions; it is called before an ioctl needs to wait for a new buffer to arrive; required to avoid a deadlock in blocking access type.

wait_finish

• type: void (*)(struct vb2_queue *q)

reacquire all locks released in the previous callback; required to continue operation after sleeping while waiting for a new buffer to arrive.

buf_init

• type: int (*)(struct vb2_buffer *vb)

called once after allocating a buffer (in MMAP case) or after acquiring a new USERPTR buffer; drivers may perform additional buffer-related initialization; initialization failure (return != 0) will prevent queue setup from completing successfully; optional.

buf_prepare

• type: int (*)(struct vb2_buffer *vb)

called every time the buffer is queued from userspace and from the VIDIOC_PREPARE_BUF ioctl; drivers may perform any initialization required before each hardware operation in this callback; drivers can access/modify the buffer here as it is still synced for the CPU; drivers that support VIDIOC_CREATE_BUFS must also validate the buffer size; if an error is returned, the buffer will not be queued in driver; optional.

buf_finish

• type: void (*)(struct vb2_buffer *vb)

called before every dequeue of the buffer back to userspace; the buffer is synced for the CPU, so drivers can access/modify the buffer contents; drivers may perform any operations required before userspace accesses the buffer; optional. The buffer state can be one of the following: DONE and ERROR occur while streaming is in progress, and the PREPARED state occurs when the queue has been canceled and all pending buffers are being returned to their default DEQUEUED state. Typically you only have to do something if the state is VB2_BUF_STATE_DONE, since in all other cases the buffer contents will be ignored anyway.

2.1. Video2Linux devices
buf_cleanup
  • type: void (*)(struct vb2_buffer *vb)
    called once before the buffer is freed; drivers may perform any additional cleanup; optional.

start_streaming
  • type: int (*)(struct vb2_queue *q,unsigned int count)
    called once to enter ‘streaming’ state; the driver may receive buffers with buf_queue call-
    back before start_streaming is called; the driver gets the number of already queued buffers
    in count parameter; driver can return an error if hardware fails, in that case all buffers that
    have been already given by the buf_queue callback are to be returned by the driver by calling
    vb2_buffer_done(VB2_BUF_STATE_QUEUED). If you need a minimum number of buffers before you
    can start streaming, then set min_buffers_needed in the vb2_queue structure. If that is non-
    zero then start_streaming won’t be called until at least that many buffers have been queued up
    by userspace.

stop_streaming
  • type: void (*)(struct vb2_queue *q)
    called when ‘streaming’ state must be disabled; driver should stop any DMA transactions or wait until
    they finish and give back all buffers it got from buf_queue callback by calling vb2_buffer_done()
    with either VB2_BUF_STATE_DONE or VB2_BUF_STATE_ERROR; may use vb2_wait_for_all_buffers() function

buf_queue
  • type: void (*)(struct vb2_buffer *vb)
    passes buffer vb to the driver; driver may start hardware operation on this buffer; driver should
    give the buffer back by calling vb2_buffer_done() function; it is always called after calling VID-
    IOC_STREAMON ioctl; might be called before start_streaming callback if user pre-queued buffers before
    calling VIDIOC_STREAMON.

struct vb2_buf_ops
driver-specific callbacks

Definition

```
struct vb2_buf_ops {
  int (* verify_planes_array) (struct vb2_buffer *vb, const void *pb);
  void (* fill_user_buffer) (struct vb2_buffer *vb, void *pb);
  int (* fill_vb2_buffer) (struct vb2_buffer *vb, const void *pb,struct vb2_plane *planes);
  void (* copy_timestamp) (struct vb2_buffer *vb, const void *pb);
};
```

Members

verify_planes_array
  • type: int (*)(struct vb2_buffer *vb, const void *pb)
    Verify that a given user space structure contains enough planes for the buffer. This is called for each
dequeued buffer.

fill_user_buffer
  • type: void (*)(struct vb2_buffer *vb, void *pb)
    given a vb2_buffer fill in the userspace structure. For V4L2 this is a struct v4l2_buffer.

fill_vb2_buffer
  • type: int (*)(struct vb2_buffer *vb, const void *pb, struct vb2_plane *planes)
    given a userspace structure, fill in the vb2_buffer. If the userspace structure is invalid, then this op
    will return an error.
copy_timestamp

- **type**: void (*)(struct vb2_buffer *vb, const void *pb)

  copy the timestamp from a userspace structure to the vb2_buffer struct.

**struct vb2_queue**

- a videobuf queue

**Definition**

```c
struct vb2_queue {
    unsigned int type;
    unsigned int io_modes;
    struct device *dev;
    unsigned long dma_attrs;
    unsigned fileio_read_once:1;
    unsigned fileio_write_immediately:1;
    unsigned allow_zero_bytesused:1;
    unsigned quirk_poll_must_check_waiting_for_buffers:1;
    struct mutex *lock;
    void *owner;
    const struct vb2_ops *ops;
    const struct vb2_mem_ops *mem_ops;
    const struct vb2_buf_ops *buf_ops;
    void *drv_priv;
    unsigned int buf_struct_size;
    u32 timestamp_flags;
    gfp_t gfp_flags;
    u32 min_buffers_needed;
};
```

**Members**

- **type**
  - **type**: unsigned int

    private buffer type whose content is defined by the vb2-core caller. For example, for V4L2, it should match the V4L2_BUF_TYPE_* in include/uapi/linux/videodev2.h

- **io_modes**
  - **type**: unsigned int

    supported io methods (see vb2_io_modes enum)

- **dev**
  - **type**: struct device *

    device to use for the default allocation context if the driver doesn’t fill in the alloc_devs array.

- **dma_attrs**
  - **type**: unsigned long

    DMA attributes to use for the DMA.

- **fileio_read_once**
  - **type**: unsigned:1

    report EOF after reading the first buffer

- **fileio_write_immediately**
  - **type**: unsigned:1

    queue buffer after each write() call
allow_zero_bytesused

  • type: unsigned:1
  allow bytesused == 0 to be passed to the driver

quirk_poll_must_check_waiting_for_buffers

  • type: unsigned:1
  Return POLLERR at poll when QBUF has not been called. This is a vb1 idiom that has been adopted also by vb2.

lock

  • type: struct mutex *
  pointer to a mutex that protects the vb2_queue struct. The driver can set this to a mutex to let the v4l2 core serialize the queuing ioctls. If the driver wants to handle locking itself, then this should be set to NULL. This lock is not used by the videobuf2 core API.

owner

  • type: void *
  The filehandle that ‘owns’ the buffers, i.e. the filehandle that called reqbufs, create_buffers or started fileio. This field is not used by the videobuf2 core API, but it allows drivers to easily associate an owner filehandle with the queue.

ops

  • type: const struct vb2_ops *
  driver-specific callbacks

mem_ops

  • type: const struct vb2_mem_ops *
  memory allocator specific callbacks

buf_ops

  • type: const struct vb2_buf_ops *
  callbacks to deliver buffer information between user-space and kernel-space

drv_priv

  • type: void *
  driver private data

buf_struct_size

  • type: unsigned int
  size of the driver-specific buffer structure; “0” indicates the driver doesn’t want to use a custom buffer structure type. for example, sizeof(struct vb2_v4l2_buffer) will be used for v4l2.

timestamp_flags

  • type: u32
  Timestamp flags; V4L2_BUF_FLAG_TIMESTAMP_* and V4L2_BUF_FLAG_TSTAMP_SRC_*

gfp_flags

  • type: gfp_t
  additional gfp flags used when allocating the buffers. Typically this is 0, but it may be e.g. GFP_DMA or _GFP_DMA32 to force the buffer allocation to a specific memory zone.
• **type**: u32
  the minimum number of buffers needed before `start_streaming()` can be called. Used when a DMA engine cannot be started unless at least this number of buffers have been queued into the driver.

```c
int vb2_thread_start(struct vb2_queue * q, vb2_thread_fnc fnc, void * priv, const char * thread_name)
start a thread for the given queue.
```

**Parameters**

- `struct vb2_queue * q` videobuf queue
- `vb2_thread_fnc fnc` callback function
- `void * priv` priv pointer passed to the callback function
- `const char * thread_name` the name of the thread. This will be prefixed with “vb2-”.

**Description**

This starts a thread that will queue and dequeue until an error occurs or `vb2_thread_stop` is called.

This function should not be used for anything else but the videobuf2-dvb support. If you think you have another good use-case for this, then please contact the linux-media mailinglist first.

```c
int vb2_thread_stop(struct vb2_queue * q)
stop the thread for the given queue.
```

**Parameters**

- `struct vb2_queue * q` videobuf queue

```c
bool vb2_is_streaming(struct vb2_queue * q)
return streaming status of the queue
```

**Parameters**

- `struct vb2_queue * q` videobuf queue

```c
bool vb2_fileio_is_active(struct vb2_queue * q)
return true if fileio is active.
```

**Parameters**

- `struct vb2_queue * q` videobuf queue

**Description**

This returns true if `read()` or `write()` is used to stream the data as opposed to stream I/O. This is almost never an important distinction, except in rare cases. One such case is that using `read()` or `write()` to stream a format using V4L2_FIELD_ALTERNATE is not allowed since there is no way you can pass the field information of each buffer to/from userspace. A driver that supports this field format should check for this in the queue_setup op and reject it if this function returns true.

```c
bool vb2_is_busy(struct vb2_queue * q)
return busy status of the queue
```

**Parameters**

- `struct vb2_queue * q` videobuf queue

**Description**

This function checks if queue has any buffers allocated.

```c
void * vb2_get_drv_priv(struct vb2_queue * q)
return driver private data associated with the queue
```

**Parameters**

- `struct vb2_queue * q` videobuf queue
void vb2_set_plane_payload(struct vb2_buffer * vb, unsigned int plane_no, unsigned long size)
set bytes used for the plane plane_no

Parameters
struct vb2_buffer * vb buffer for which plane payload should be set
unsigned int plane_no plane number for which payload should be set
unsigned long size payload in bytes

unsigned long vb2_get_plane_payload(struct vb2_buffer * vb, unsigned int plane_no)
get bytes used for the plane plane_no

Parameters
struct vb2_buffer * vb buffer for which plane payload should be set
unsigned int plane_no plane number for which payload should be set

unsigned long vb2_plane_size(struct vb2_buffer * vb, unsigned int plane_no)
return plane size in bytes

Parameters
struct vb2_buffer * vb buffer for which plane size should be returned
unsigned int plane_no plane number for which size should be returned

bool vb2_start_streaming_called(struct vb2_queue * q)
return streaming status of driver

Parameters
struct vb2_queue * q videobuf queue

void vb2_clear_last_buffer_dequeued(struct vb2_queue * q)
clear last buffer dequeued flag of queue

Parameters
struct vb2_queue * q videobuf queue
struct vb2_v4l2_buffer
video buffer information for v4l2

Definition
struct vb2_v4l2_buffer {
    struct vb2_buffer vb2_buf;
    __u32 flags;
    __u32 field;
    struct v4l2_timecode timecode;
    __u32 sequence;
};

Members
vb2_buf
• type: struct vb2_buffer
    video buffer 2

flags
• type: __u32
    buffer informational flags

field
• type: __u32
enum v4l2_field; field order of the image in the buffer

timecode
  • type: struct v4l2_timecode
    frame timecode

sequence
  • type: __u32
    sequence count of this frame Should contain enough information to be able to cover all the fields of
    struct v4l2_buffer at videodev2.h

struct vb2_vmarea_handler
  common vma refcount tracking handler

Definition

```c
struct vb2_vmarea_handler {
  atomic_t * refcount;
  void (* put) (void *arg);
  void * arg;
};
```

Members

refcount
  • type: atomic_t *
    pointer to refcount entry in the buffer

put
  • type: void (*)(void *arg)
    callback to function that decreases buffer refcount

arg
  • type: void *
    argument for put callback

2.1.15 V4L2 clocks

**Attention:**

This is a temporary API and it shall be replaced by the generic clock API, when the latter becomes widely available.

Many subdevices, like camera sensors, TV decoders and encoders, need a clock signal to be supplied by the system. Often this clock is supplied by the respective bridge device. The Linux kernel provides a Common Clock Framework for this purpose. However, it is not (yet) available on all architectures. Besides, the nature of the multi-functional (clock, data + synchronisation, I2C control) connection of subdevices to the system might impose special requirements on the clock API usage. E.g. V4L2 has to support clock provider driver unregistration while a subdevice driver is holding a reference to the clock. For these reasons a V4L2 clock helper API has been developed and is provided to bridge and subdevice drivers.

The API consists of two parts: two functions to register and unregister a V4L2 clock source: v4l2_clk_register() and v4l2_clk_unregister() and calls to control a clock object, similar to the respective generic clock API calls: v4l2_clk_get(), v4l2_clk_put(), v4l2_clk_enable(), v4l2_clk_disable(),
v4l2_clk_get_rate(), and v4l2_clk_set_rate(). Clock suppliers have to provide clock operations that will be called when clock users invoke respective API methods.

It is expected that once the CCF becomes available on all relevant architectures this API will be removed.

### 2.1.16 V4L2 DV Timings functions

#### bool v4l2_valid_dv_timings(const struct v4l2_dv_timings * t, const struct v4l2_dv_timings_cap * cap, v4l2_check_dv_timings_fnc fnc, void * fnc_handle)

are these timings valid?

**Parameters**

- `const struct v4l2_dv_timings * t` the v4l2_dv_timings struct.
- `const struct v4l2_dv_timings_cap * cap` the v4l2_dv_timings_cap capabilities.
- `v4l2_check_dv_timings_fnc fnc` callback to check if this timing is OK. May be NULL.
- `void * fnc_handle` a handle that is passed on to fnc.

**Description**

Returns true if the given dv_timings struct is supported by the hardware capabilities and the callback function (if non-NULL), returns false otherwise.

#### int v4l2_enum_dv_timings_cap(struct v4l2_enum_dv_timings * t, const struct v4l2_dv_timings_cap * cap, v4l2_check_dv_timings_fnc fnc, void * fnc_handle)

Helper function to enumerate possible DV timings based on capabilities

**Parameters**

- `struct v4l2_enum_dv_timings * t` the v4l2_enum_dv_timings struct.
- `const struct v4l2_dv_timings_cap * cap` the v4l2_dv_timings_cap capabilities.
- `v4l2_check_dv_timings_fnc fnc` callback to check if this timing is OK. May be NULL.
- `void * fnc_handle` a handle that is passed on to fnc.

**Description**

This enumerates dv_timings using the full list of possible CEA-861 and DMT timings, filtering out any timings that are not supported based on the hardware capabilities and the callback function (if non-NULL). If a valid timing for the given index is found, it will fill in t and return 0, otherwise it returns -EINVAL.

#### bool v4l2_find_dv_timings_cap(struct v4l2_dv_timings * t, const struct v4l2_dv_timings_cap * cap, unsigned pclock_delta, v4l2_check_dv_timings_fnc fnc, void * fnc_handle)

Find the closest timings struct

**Parameters**

- `struct v4l2_dv_timings * t` the v4l2_enum_dv_timings struct.
- `const struct v4l2_dv_timings_cap * cap` the v4l2_dv_timings_cap capabilities.
- `unsigned pclock_delta` maximum delta between t->pixelclock and the timing struct under consideration.
- `v4l2_check_dv_timings_fnc fnc` callback to check if a given timings struct is OK. May be NULL.
- `void * fnc_handle` a handle that is passed on to fnc.

**Description**

This function tries to map the given timings to an entry in the full list of possible CEA-861 and DMT timings, filtering out any timings that are not supported based on the hardware capabilities and the callback function (if non-NULL).
On success it will fill in `t` with the found timings and it returns true. On failure it will return false.

```c
bool v4l2_match_dv_timings(const struct v4l2_dv_timings * measured, const struct v4l2_dv_timings * standard, unsigned pclock_delta, bool match_reduced_fps)
```

do two timings match?

**Parameters**

- `const struct v4l2_dv_timings * measured` the measured timings data.
- `const struct v4l2_dv_timings * standard` the timings according to the standard.
- `unsigned pclock_delta` maximum delta in Hz between standard->pixelclock and the measured timings.
- `bool match_reduced_fps` if true, then fail if V4L2_DV_FL_REDUCED_FPS does not match.

**Description**

Returns true if the two timings match, returns false otherwise.

```c
void v4l2_print_dv_timings(const char * dev_prefix, const char * prefix, const struct v4l2_dv_timings * t, bool detailed)
```

log the contents of a dv_timings struct

**Parameters**

- `const char * dev_prefix` device prefix for each log line.
- `const char * prefix` additional prefix for each log line, may be NULL.
- `const struct v4l2_dv_timings * t` the timings data.
- `bool detailed` if true, give a detailed log.

```c
bool v4l2_detect_cvt(unsigned frame_height, unsigned hfreq, unsigned vsync, unsigned active_width, u32 polarities, bool interlaced, struct v4l2_dv_timings * fmt)
```

detect if the given timings follow the CVT standard

**Parameters**

- `unsigned frame_height` the total height of the frame (including blanking) in lines.
- `unsigned hfreq` the horizontal frequency in Hz.
- `unsigned vsync` the height of the vertical sync in lines.
- `unsigned active_width` active width of image (does not include blanking). This information is needed only in case of version 2 of reduced blanking. In other cases, this parameter does not have any effect on timings.
- `u32 polarities` the horizontal and vertical polarities (same as struct v4l2_bt_timings polarities).
- `bool interlaced` if this flag is true, it indicates interlaced format
- `struct v4l2_dv_timings * fmt` the resulting timings.

**Description**

This function will attempt to detect if the given values correspond to a valid CVT format. If so, then it will return true, and fmt will be filled in with the found CVT timings.

```c
bool v4l2_detect_gtf(unsigned frame_height, unsigned hfreq, unsigned vsync, u32 polarities, bool interlaced, struct v4l2_fract aspect, struct v4l2_dv_timings * fmt)
```

detect if the given timings follow the GTF standard

**Parameters**

- `unsigned frame_height` the total height of the frame (including blanking) in lines.
- `unsigned hfreq` the horizontal frequency in Hz.
unsigned vsync the height of the vertical sync in lines.

u32 polarities the horizontal and vertical polarities (same as struct v4l2_bt_timings polarities).

bool interlaced if this flag is true, it indicates interlaced format

struct v4l2_fract aspect preferred aspect ratio. GTF has no method of determining the aspect ratio in order to derive the image width from the image height, so it has to be passed explicitly. Usually the native screen aspect ratio is used for this. If it is not filled in correctly, then 16:9 will be assumed.

struct v4l2_dv_timings * fmt the resulting timings.

Description
This function will attempt to detect if the given values correspond to a valid GTF format. If so, then it will return true, and fmt will be filled in with the found GTF timings.

struct v4l2_fract v4l2_calc_aspect_ratio(u8 hor_landscape, u8 vert_portrait)
calculate the aspect ratio based on bytes 0x15 and 0x16 from the EDID.

Parameters
u8 hor_landscape byte 0x15 from the EDID.

u8 vert_portrait byte 0x16 from the EDID.

Description
Determines the aspect ratio from the EDID. See VESA Enhanced EDID standard, release A, rev 2, section 3.6.2: “Horizontal and Vertical Screen Size or Aspect Ratio”

2.1.17 V4L2 flash functions and data structures

struct v4l2_flash_config
V4L2 Flash sub-device initialization data

Definition

```c
struct v4l2_flash_config {
    char dev_name[32];
    struct led_flash_setting torch_intensity;
    struct led_flash_setting indicator_intensity;
    u32 flash_faults;
    unsigned int has_external_strobe;
};
```

Members

dev_name[32]

  • type: char
    the name of the media entity, unique in the system
torch_intensity

  • type: struct led_flash_setting
    constraints for the LED in torch mode
indicator_intensity

  • type: struct led_flash_setting
    constraints for the indicator LED
flash_faults

  • type: u32
bitmask of flash faults that the LED flash class device can report; corresponding LED_FAULT* bit
definitions are available in the header file `<linux/led-class-flash.h>`

has_external_strobe

  • **type**: unsigned int:1
  
  external strobe capability

`struct v4l2_flash`

Flash sub-device context

**Definition**

```c
struct v4l2_flash {
  struct led_classdev_flash * fled_cdev;
  struct led_classdev_flash * iled_cdev;
  const struct v4l2_flash_ops * ops;
  struct v4l2_subdev sd;
  struct v4l2_ctrl_handler hdl;
  struct v4l2_ctrl ** ctrls;
};
```

**Members**

`fled_cdev`

  • **type**: struct led_classdev_flash *
  
  LED flash class device controlled by this sub-device

`iled_cdev`

  • **type**: struct led_classdev_flash *
  
  LED class device representing indicator LED associated with the LED flash class device

`ops`

  • **type**: const struct v4l2_flash_ops *
  
  V4L2 specific flash ops

`sd`

  • **type**: struct v4l2_subdev
  
  V4L2 sub-device

`hdl`

  • **type**: struct v4l2_ctrl_handler
  
  flash controls handler

`ctrls`

  • **type**: struct v4l2_ctrl **
  
  array of pointers to controls, whose values define the sub-device state

`struct v4l2_flash * v4l2_flash_init` (struct device * `dev`, struct device_node * `of_node`, struct led_classdev_flash * `fled_cdev`, struct led_classdev_flash * `iled_cdev`, const struct v4l2_flash_ops * `ops`, struct v4l2_flash_config * `config`)

initialize V4L2 flash led sub-device

**Parameters**

`struct device * dev` flash device, e.g. an I2C device

`struct device_node * of_node` of_node of the LED, may be NULL if the same as device's
struct led_classdev_flash * fled_cdev  LED flash class device to wrap
struct led_classdev_flash * iled_cdev  LED flash class device representing indicator LED associated with fled_cdev, may be NULL
const struct v4l2_flash_ops * ops  V4L2 Flash device ops
struct v4l2_flash_config * config  initialization data for V4L2 Flash sub-device

Description
Create V4L2 Flash sub-device wrapping given LED subsystem device.

Return
A valid pointer, or, when an error occurs, the return value is encoded using ERR_PTR(). Use IS_ERR() to check and PTR_ERR() to obtain the numeric return value.

void v4l2_flash_release(struct v4l2_flash * v4l2_flash)
release V4L2 Flash sub-device

Parameters
struct v4l2_flash * v4l2_flash  the V4L2 Flash sub-device to release

Description
Release V4L2 Flash sub-device.

2.1.18 V4L2 Media Controller functions and data structures

enum tuner_pad_index
tuner pad index for MEDIA_ENT_F_TUNER

Constants
TUNER_PAD_RF_INPUT  Radiofrequency (RF) sink pad, usually linked to a RF connector entity.
TUNER_PAD_OUTPUT  Tuner video output source pad. Contains the video chrominance and luminance or the hole bandwidth of the signal converted to an Intermediate Frequency (IF) or to baseband (on zero-IF tuners).
TUNER_PAD_AUD_OUT  Tuner audio output source pad. Tuners used to decode analog TV signals have an extra pad for audio output. Old tuners use an analog stage with a saw filter for the audio IF frequency. The output of the pad is, in this case, the audio IF, with should be decoded either by the bridge chipset (that’s the case of cx2388x chipsets) or may require an external IF sound processor, like msp34xx. On modern silicon tuners, the audio IF decoder is usually incorporated at the tuner. On such case, the output of this pad is an audio sampled data.
TUNER_NUM_PADS  Number of pads of the tuner.

enum if_vid_dec_pad_index
video IF-PLL pad index for MEDIA_ENT_F_IF_VID_DECODER

Constants
IF_vid_DEC_PAD_IF_INPUT  video Intermediate Frequency (IF) sink pad
IF_vid_DEC_PAD_OUT  IF-PLL video output source pad. Contains the video chrominance and luminance IF signals.
IF_vid_DEC_PAD_NUM_PADS  Number of pads of the video IF-PLL.

enum if_aud_dec_pad_index
audio/sound IF-PLL pad index for MEDIA_ENT_F_IF_AUD_DECODER

Constants
IF_AUD_DEC_PAD_IF_INPUT  audio Intermediate Frequency (IF) sink pad
IF_AUD_DEC_PAD_OUT IF-PLL audio output source pad. Contains the audio sampled stream data, usually connected to the bridge bus via an Inter-IC Sound (I2S) bus.

IF_AUD_DEC_PAD_NUM_PADS Number of pads of the audio IF-PLL.

demod_pad_index enum
analog TV pad index for MEDIA_ENT_F_ATV_DECODER

Constants

DEMOD_PAD_IF_INPUT IF input sink pad.

DEMOD_PAD_VID_OUT Video output source pad.

DEMOD_PAD_VBI_OUT Vertical Blank Interface (VBI) output source pad.

DEMOD_PAD_AUDIO_OUT Audio output source pad.

DEMOD_NUM_PADS Maximum number of output pads.

v4l2_mc_create_media_graph

```
struct media_device * mdev
```
create Media Controller links at the graph.

Parameters

- struct media_device * mdev pointer to the media_device struct.

Description

Add links between the entities commonly found on PC customer’s hardware at the V4L2 side: camera sensors, audio and video PLL-IF decoders, tuners, analog TV decoder and I/O entities (video, VBI and Software Defined Radio).

Note:

> Webcams are modelled on a very simple way: the sensor is connected directly to the I/O entity. All dirty details, like scaler and crop HW are hidden. While such mapping is enough for v4l2 interface centric PC-consumer’s hardware, V4L2 subdev centric camera hardware should not use this routine, as it will not build the right graph.

v4l_enable_media_source

```
struct video_device * vdev
```
Hold media source for exclusive use if free

Parameters

- struct video_device * vdev pointer to struct video_device

Description

This interface calls enable_source handler to determine if media source is free for use. The enable_source handler is responsible for checking is the media source is free and start a pipeline between the media source and the media entity associated with the video device. This interface should be called from v4l2-core and dvb-core interfaces that change the source configuration.

Return

returns zero on success or a negative error code.

v4l_disable_media_source

```
struct video_device * vdev
```
Release media source

Parameters

- struct video_device * vdev pointer to struct video_device

Description

2.1. Video2Linux devices
This interface calls disable_source handler to release the media source. The disable_source handler stops the active media pipeline between the media source and the media entity associated with the video device.

**Return**
returns zero on success or a negative error code.

```c
int v4l2_pipeline_pm_use(struct media_entity * entity, int use)
```
Update the use count of an entity

**Parameters**
- **struct media_entity * entity** The entity
- **int use** Use (1) or stop using (0) the entity

**Description**
Update the use count of all entities in the pipeline and power entities on or off accordingly.

This function is intended to be called in video node open (use == 1) and release (use == 0). It uses struct media_entity.use_count to track the power status. The use of this function should be paired with v4l2_pipeline_link_notify().

Return 0 on success or a negative error code on failure. Powering entities off is assumed to never fail. No failure can occur when the use parameter is set to 0.

```c
int v4l2_pipeline_link_notify(struct media_link * link, u32 flags, unsigned int notification)
```
Link management notification callback

**Parameters**
- **struct media_link * link** The link
- **u32 flags** New link flags that will be applied
- **unsigned int notification** The link’s state change notification type (MEDIA_DEV_NOTIFY_*)

**Description**
React to link management on powered pipelines by updating the use count of all entities in the source and sink sides of the link. Entities are powered on or off accordingly. The use of this function should be paired with v4l2_pipeline_pm_use().

Return 0 on success or a negative error code on failure. Powering entities off is assumed to never fail. This function will not fail for disconnection events.

### 2.1.19 V4L2 Media Bus functions and data structures

**enum v4l2_mbus_type**
media bus type

**Constants**
- **V4L2_MBUS_PARALLEL** parallel interface with hsync and vsync
- **V4L2_MBUS_BT656** parallel interface with embedded synchronisation, can also be used for BT.1120
- **V4L2_MBUS_CSI2** MIPI CSI-2 serial interface

```c
struct v4l2_mbus_config{
    enum v4l2_mbus_type type;
    unsigned int flags;
};
```
Members

**type**
- **type**: enum v4l2_mbus_type
  - in: interface type

**flags**
- **type**: unsigned int
  - in / out: configuration flags, depending on **type**

### 2.1.20 V4L2 Memory to Memory functions and data structures

**struct v4l2_m2m_ops**
- mem-to-mem device driver callbacks

**Definition**

```c
struct v4l2_m2m_ops {
    void (* device_run) (void *priv);
    int (* job_ready) (void *priv);
    void (* job_abort) (void *priv);
    void (* lock) (void *priv);
    void (* unlock) (void *priv);
};
```

**Members**

**device_run**
- **type**: void (*)(void *priv)
  - required. Begin the actual job (transaction) inside this callback. The job does NOT have to end before this callback returns (and it will be the usual case). When the job finishes, v4l2_m2m_job_finish() has to be called.

**job_ready**
- **type**: int (*)(void *priv)
  - optional. Should return 0 if the driver does not have a job fully prepared to run yet (i.e. it will not be able to finish a transaction without sleeping). If not provided, it will be assumed that one source and one destination buffer are all that is required for the driver to perform one full transaction. This method may not sleep.

**job_abort**
- **type**: void (*)(void *priv)
  - required. Informs the driver that it has to abort the currently running transaction as soon as possible (i.e. as soon as it can stop the device safely; e.g. in the next interrupt handler), even if the transaction would not have been finished by then. After the driver performs the necessary steps, it has to call v4l2_m2m_job_finish() (as if the transaction ended normally). This function does not have to (and will usually not) wait until the device enters a state when it can be stopped.

**lock**
- **type**: void (*)(void *priv)
  - optional. Define a driver's own lock callback, instead of using m2m_ctx->q_lock.

**unlock**
- **type**: void (*)(void *priv)
optional. Define a driver’s own unlock callback, instead of using m2m_ctx->q_lock.

unsigned int v4l2_m2m_num_src_bufs_ready(struct v4l2_m2m_ctx * m2m_ctx)
return the number of source buffers ready for use

Parameters

struct v4l2_m2m_ctx * m2m_ctx pointer to struct v4l2_m2m_ctx

unsigned int v4l2_m2m_num_dst_bufs_ready(struct v4l2_m2m_ctx * m2m_ctx)
return the number of destination buffers ready for use

Parameters

struct v4l2_m2m_ctx * m2m_ctx pointer to struct v4l2_m2m_ctx

void * v4l2_m2m_next_src_buf(struct v4l2_m2m_ctx * m2m_ctx)
return next source buffer from the list of ready buffers

Parameters

struct v4l2_m2m_ctx * m2m_ctx pointer to struct v4l2_m2m_ctx

void * v4l2_m2m_next_dst_buf(struct v4l2_m2m_ctx * m2m_ctx)
return next destination buffer from the list of ready buffers

Parameters

struct v4l2_m2m_ctx * m2m_ctx pointer to struct v4l2_m2m_ctx

struct vb2_queue * v4l2_m2m_get_src_vq(struct v4l2_m2m_ctx * m2m_ctx)
return vb2_queue for source buffers

Parameters

struct v4l2_m2m_ctx * m2m_ctx pointer to struct v4l2_m2m_ctx

struct vb2_queue * v4l2_m2m_get_dst_vq(struct v4l2_m2m_ctx * m2m_ctx)
return vb2_queue for destination buffers

Parameters

struct v4l2_m2m_ctx * m2m_ctx pointer to struct v4l2_m2m_ctx

void * v4l2_m2m_src_buf_remove(struct v4l2_m2m_ctx * m2m_ctx)
take off a source buffer from the list of ready buffers and return it

Parameters

struct v4l2_m2m_ctx * m2m_ctx pointer to struct v4l2_m2m_ctx

void * v4l2_m2m_dst_buf_remove(struct v4l2_m2m_ctx * m2m_ctx)
take off a destination buffer from the list of ready buffers and return it

Parameters

struct v4l2_m2m_ctx * m2m_ctx pointer to struct v4l2_m2m_ctx

2.1.21 V4L2 Open Firmware kAPI

struct v4l2_of_bus_mipi_csi2
MIPI CSI-2 bus data structure

Definition

```
struct v4l2_of_bus_mipi_csi2 {
    unsigned int flags;
    unsigned char data_lanes[4];
    unsigned char clock_lane;
    unsigned short num_data_lanes;
```

Chapter 2. Media subsystem kernel internal API
bool lane_polarities[5];
};

Members
flags
  • type: unsigned int
    media bus (V4L2_MBUS_*) flags
data_lanes[4]
  • type: unsigned char
    an array of physical data lane indexes
clock_lane
  • type: unsigned char
    physical lane index of the clock lane
num_data_lanes
  • type: unsigned short
    number of data lanes
lane_polarities[5]
  • type: bool
    polarity of the lanes. The order is the same of the physical lanes.

struct v4l2_of_bus_parallel
  parallel data bus data structure

Definition
struct v4l2_of_bus_parallel {
  unsigned int flags;
  unsigned char bus_width;
  unsigned char data_shift;
};

Members
flags
  • type: unsigned int
    media bus (V4L2_MBUS_*) flags
bus_width
  • type: unsigned char
    bus width in bits
data_shift
  • type: unsigned char
    data shift in bits
struct v4l2_of_endpoint
  the endpoint data structure

2.1. Video2Linux devices
struct v4l2_of_endpoint {
    struct of_endpoint base;
    enum v4l2_mbus_type bus_type;
    union bus;
    u64 * link_frequencies;
    unsigned int nr_of_link_frequencies;
};

Members

base

- **type**: struct of_endpoint
  - struct of_endpoint containing port, id, and local of_node

bus_type

- **type**: enum v4l2_mbus_type
  - bus type

bus

- **type**: union
  - bus configuration data structure

link_frequencies

- **type**: u64 *
  - array of supported link frequencies

nr_of_link_frequencies

- **type**: unsigned int
  - number of elements in link_frequencies array

struct v4l2_of_link

- a link between two endpoints

Definition

struct v4l2_of_link {
    struct device_node * local_node;
    unsigned int local_port;
    struct device_node * remote_node;
    unsigned int remote_port;
};

Members

local_node

- **type**: struct device_node *
  - pointer to device_node of this endpoint

local_port

- **type**: unsigned int
  - identifier of the port this endpoint belongs to

remote_node

- **type**: struct device_node *
  - pointer to device_node of the remote endpoint
remote_port
  • type: unsigned int
    identifier of the port the remote endpoint belongs to

2.1.22 V4L2 rect helper functions

void v4l2_rect_set_size_to(struct v4l2_rect * r, const struct v4l2_rect * size)
  copy the width/height values.

Parameters
struct v4l2_rect * r rect whose width and height fields will be set
const struct v4l2_rect * size rect containing the width and height fields you need.

void v4l2_rect_set_min_size(struct v4l2_rect * r, const struct v4l2_rect * min_size)
  width and height of r should be >= min_size.

Parameters
struct v4l2_rect * r rect whose width and height will be modified
const struct v4l2_rect * min_size rect containing the minimal width and height

void v4l2_rect_set_max_size(struct v4l2_rect * r, const struct v4l2_rect * max_size)
  width and height of r should be <= max_size

Parameters
struct v4l2_rect * r rect whose width and height will be modified
const struct v4l2_rect * max_size rect containing the maximum width and height

void v4l2_rect_map_inside(struct v4l2_rect * r, const struct v4l2_rect * boundary)
  r should be inside boundary.

Parameters
struct v4l2_rect * r rect that will be modified
const struct v4l2_rect * boundary rect containing the boundary for r

bool v4l2_rect_same_size(const struct v4l2_rect * r1, const struct v4l2_rect * r2)
  return true if r1 has the same size as r2

Parameters
const struct v4l2_rect * r1 rectangle.
const struct v4l2_rect * r2 rectangle.

Description
Return true if both rectangles have the same size.

void v4l2_rect_intersect(struct v4l2_rect * r, const struct v4l2_rect * r1, const struct v4l2_rect * r2)
  calculate the intersection of two rects.

Parameters
struct v4l2_rect * r intersection of r1 and r2.
const struct v4l2_rect * r1 rectangle.
const struct v4l2_rect * r2 rectangle.

void v4l2_rect_scale(struct v4l2_rect * r, const struct v4l2_rect * from, const struct v4l2_rect * to)
  scale rect r by to/from

2.1. Video2Linux devices
Parameters

struct v4l2_rect * r rect to be scaled.
const struct v4l2_rect * from from rectangle.
const struct v4l2_rect * to to rectangle.

Description
This scales rectangle r horizontally by to->width / from->width and vertically by to->height / from->height.

Typically r is a rectangle inside from and you want the rectangle as it would appear after scaling from to to. So the resulting r will be the scaled rectangle inside to.

bool v4l2_rect_overlap(const struct v4l2_rect * r1, const struct v4l2_rect * r2)
do r1 and r2 overlap?

Parameters
const struct v4l2_rect * r1 rectangle.
const struct v4l2_rect * r2 rectangle.

Description
Returns true if r1 and r2 overlap.

2.1.23 Tuner functions and data structures

definition

enum tuner_mode

Mode of the tuner

Constants

T_RADIO Tuner core will work in radio mode
T_ANALOG_TV Tuner core will work in analog TV mode

Description
Older boards only had a single tuner device, but some devices have a separate tuner for radio. In any case, the tuner-core needs to know if the tuner chip(s) will be used in radio mode or analog TV mode, as, on radio mode, frequencies are specified on a different range than on TV mode. This enum is used by the tuner core in order to work with the proper tuner range and eventually use a different tuner chip while in radio mode.

struct tuner_setup

setup the tuner chipsets

Definition

struct tuner_setup {
    unsigned short addr;
    unsigned int type;
    unsigned int mode_mask;
    void * config;
    int (* tuner_callback) (void *dev, int component, int cmd, int arg);
};

Members

addr

• type: unsigned short
I2C address used to control the tuner device/chipset
type
  • type: unsigned int
    Type of the tuner, as defined at the TUNER_* macros. Each different tuner model should have an
    unique identifier.

mode_mask
  • type: unsigned int
    Mask with the allowed tuner modes: V4L2_TUNER_RADIO, V4L2_TUNER_ANALOG_TV and/or
    V4L2_TUNER_DIGITAL_TV, describing if the tuner should be used to support Radio, analog TV and/or
digital TV.

config
  • type: void *
    Used to send tuner-specific configuration for complex tuners that require extra parameters to be set.
    Only a very few tuners require it and its usage on newer tuners should be avoided.

tuner_callback
  • type: int (*)(void *dev,int component,int cmd,int arg)
    Some tuners require to call back the bridge driver, in order to do some tasks like rising a GPIO at the
    bridge chipset, in order to do things like resetting the device.

Description
Older boards only had a single tuner device. Nowadays multiple tuner devices may be present on a single
board. Using TUNER_SET_TYPE_ADDR to pass the tuner_setup structure it is possible to setup each tuner
device in turn.

Since multiple devices may be present it is no longer sufficient to send a command to a single i2c device.
Instead you should broadcast the command to all i2c devices.

By setting the mode_mask correctly you can select which commands are accepted by a specific tuner
device. For example, set mode_mask to T_RADIO if the device is a radio-only tuner. That specific tuner
will only accept commands when the tuner is in radio mode and ignore them when the tuner is set to TV
mode.

enum param_type
  type of the tuner parameters

Constants
TUNER_PARAM_TYPE_RADIO Tuner params are for FM and/or AM radio
TUNER_PARAM_TYPE_PAL Tuner params are for PAL color TV standard
TUNER_PARAM_TYPE_SECAM Tuner params are for SECAM color TV standard
TUNER_PARAM_TYPE_NTSC Tuner params are for NTSC color TV standard
TUNER_PARAM_TYPE_DIGITAL Tuner params are for digital TV

struct tuner_range
  define the frequencies supported by the tuner

Definition

```c
struct tuner_range {
  unsigned short limit;
  unsigned char config;
  unsigned char cb;
};
```

Members

2.1. Video2Linux devices
limit
  • **type**: unsigned short

    Max frequency supported by that range, in 62.5 kHz (TV) or 62.5 Hz (Radio), as defined by
    V4L2_TUNER_CAP_LOW.

config
  • **type**: unsigned char

    Value of the band switch byte (BB) to setup this mode.

cb
  • **type**: unsigned char

    Value of the CB byte to setup this mode.

Description

Please notice that digital tuners like xc3028/xc4000/xc5000 don’t use those ranges, as they’re defined
inside the driver. This is used by analog tuners that are compatible with the “Philips way” to setup the
tuners. On those devices, the tuner set is done via 4 bytes:

1. divider byte1 (DB1)
2. divider byte 2 (DB2)
3. Control byte (CB)
4. band switch byte (BB)

Some tuners also have an additional optional Auxiliary byte (AB).

struct **tuner_params**

Parameters to be used to setup the tuner. Those are used by drivers/media/tuners/tuner-types.c in
order to specify the tuner properties. Most of the parameters are for tuners based on tda9887 IF-PLL
multi-standard analog TV/Radio demodulator, with is very common on legacy analog tuners.

Definition

```c
struct tuner_params {
  enum param_type type;
  unsigned int cb_first_if_lower_freq:1;
  unsigned int has_tda9887:1;
  unsigned int port1_fm_high_sensitivity:1;
  unsigned int port2_fm_high_sensitivity:1;
  unsigned int fm_gain_normal:1;
  unsigned int intercarrier_mode:1;
  unsigned int port1_active:1;
  unsigned int port2_active:1;
  unsigned int port1_invert_for_secam_lc:1;
  unsigned int port2_invert_for_secam_lc:1;
  unsigned int port1_set_for_fm_mono:1;
  unsigned int default_pll_gating_18:1;
  unsigned int radio_if:2;
  signed int default_top_low:5;
  signed int default_top_mid:5;
  signed int default_top_high:5;
  signed int default_top_secam_low:5;
  signed int default_top_secam_mid:5;
  signed int default_top_secam_high:5;
  u16 iffreq;
  unsigned int count;
  struct tuner_range * ranges;
};
```

Members
type
  • **type**: enum param_type

  Type of the tuner parameters, as defined at enum param_type. If the tuner supports multiple standards, an array should be used, with one row per different standard.

**cb_first_if_lower_freq**
  • **type**: unsigned int:1

  Many Philips-based tuners have a comment in their datasheet like “For channel selection involving band switching, and to ensure smooth tuning to the desired channel without causing unnecessary charge pump action, it is recommended to consider the difference between wanted channel frequency and the current channel frequency. Unnecessary charge pump action will result in very low tuning voltage which may drive the oscillator to extreme conditions”. Set cb_first_if_lower_freq to 1, if this check is required for this tuner. I tested this for PAL by first setting the TV frequency to 203 MHz and then switching to 96.6 MHz FM radio. The result was static unless the control byte was sent first.

**has_tda9887**
  • **type**: unsigned int:1

  Set to 1 if this tuner uses a tda9887

**port1_fm_high_sensitivity**
  • **type**: unsigned int:1

  Many Philips tuners use tda9887 PORT1 to select the FM radio sensitivity. If this setting is 1, then set PORT1 to 1 to get proper FM reception.

**port2_fm_high_sensitivity**
  • **type**: unsigned int:1

  Some Philips tuners use tda9887 PORT2 to select the FM radio sensitivity. If this setting is 1, then set PORT2 to 1 to get proper FM reception.

**fm_gain_normal**
  • **type**: unsigned int:1

  Some Philips tuners use tda9887 cGainNormal to select the FM radio sensitivity. If this setting is 1, the register will use cGainNormal instead of cGainLow.

**intercarrier_mode**
  • **type**: unsigned int:1

  Most tuners with a tda9887 use QSS mode. Some (cheaper) tuners use Intercarrier mode. If this setting is 1, then the tuner needs to be set to intercarrier mode.

**port1_active**
  • **type**: unsigned int:1

  This setting sets the default value for PORT1. 0 means inactive, 1 means active. Note: the actual bit value written to the tda9887 is inverted. So a 0 here means a 1 in the B6 bit.

**port2_active**
  • **type**: unsigned int:1

  This setting sets the default value for PORT2. 0 means inactive, 1 means active. Note: the actual bit value written to the tda9887 is inverted. So a 0 here means a 1 in the B7 bit.

**port1_invert_for_secam_lc**
  • **type**: unsigned int:1
Sometimes PORT1 is inverted when the SECAM-L’ standard is selected. Set this bit to 1 if this is needed.

`port2_invert_for_secam_lc`

- **type**: unsigned int:1

Sometimes PORT2 is inverted when the SECAM-L’ standard is selected. Set this bit to 1 if this is needed.

`port1_set_for_fm_mono`

- **type**: unsigned int:1

Some cards require PORT1 to be 1 for mono Radio FM and 0 for stereo.

`default_pll_gating_18`

- **type**: unsigned int:1

Select 18% (or according to datasheet 0%) L standard PLL gating, vs the driver default of 36%.

`radio_if`

- **type**: unsigned int:2

IF to use in radio mode. Tuners with a separate radio IF filter seem to use 10.7, while those without use 33.3 for PAL/SECAM tuners and 41.3 for NTSC tuners. 0 = 10.7, 1 = 33.3, 2 = 41.3

`default_top_low`

- **type**: signed int:5

Default tda9887 TOP value in dB for the low band. Default is 0. Range: -16:+15

`default_top_mid`

- **type**: signed int:5

Default tda9887 TOP value in dB for the mid band. Default is 0. Range: -16:+15

`default_top_high`

- **type**: signed int:5

Default tda9887 TOP value in dB for the high band. Default is 0. Range: -16:+15

`default_top_secam_low`

- **type**: signed int:5

Default tda9887 TOP value in dB for SECAM-L/L’ for the low band. Default is 0. Several tuners require a different TOP value for the SECAM-L/L’ standards. Range: -16:+15

`default_top_secam_mid`

- **type**: signed int:5

Default tda9887 TOP value in dB for SECAM-L/L’ for the mid band. Default is 0. Several tuners require a different TOP value for the SECAM-L/L’ standards. Range: -16:+15

`default_top_secam_high`

- **type**: signed int:5

Default tda9887 TOP value in dB for SECAM-L/L’ for the high band. Default is 0. Several tuners require a different TOP value for the SECAM-L/L’ standards. Range: -16:+15

`iffreq`

- **type**: u16

Intermediate frequency (IF) used by the tuner on digital mode.
• **type**: unsigned int
  Size of the ranges array.

ranges
• **type**: struct tuner_range *
  Array with the frequency ranges supported by the tuner.

### 2.1.24 V4L2 common functions and data structures

```c
int v4l2_ctrl_query_fill(struct v4l2_queryctrl * qctrl, s32 min, s32 max, s32 step, s32 def)
```

**Parameters**

- `struct v4l2_queryctrl * qctrl` pointer to the `struct v4l2_queryctrl` to be filled
- `s32 min` minimum value for the control
- `s32 max` maximum value for the control
- `s32 step` control step
- `s32 def` default value for the control

**Description**

Fills the `struct v4l2_queryctrl` fields for the query control.

**Note:**

This function assumes that the `qctrl->id` field is filled.

Returns -EINVAL if the control is not known by the V4L2 core, 0 on success.

```c
struct v4l2_subdev * v4l2_i2c_new_subdev(struct v4l2_device * v4l2_dev, struct i2c_adapter * adapter, const char * client_type, u8 addr, const unsigned short * probe_addrs)
```

Load an i2c module and return an initialized `struct v4l2_subdev`.

**Parameters**

- `struct v4l2_device * v4l2_dev` pointer to `struct v4l2_device`
- `struct i2c_adapter * adapter` pointer to struct i2c_adapter
- `const char * client_type` name of the chip that's on the adapter.
- `u8 addr` I2C address. If zero, it will use `probe_addrs`
- `const unsigned short * probe_addrs` array with a list of address. The last entry at such array should be I2C_CLIENT_END.

**Description**

returns a `struct v4l2_subdev` pointer.

```c
struct v4l2_subdev * v4l2_i2c_new_subdev_board(struct v4l2_device * v4l2_dev, struct i2c_adapter * adapter, struct i2c_board_info * info, const unsigned short * probe_addrs)
```

Load an i2c module and return an initialized `struct v4l2_subdev`.

**Parameters**

- `struct v4l2_device * v4l2_dev` pointer to `struct v4l2_device`
- `struct i2c_adapter * adapter` pointer to struct i2c_adapter
**struct i2c_board_info** * info  
pointer to struct i2c_board_info used to replace the irq, platform_data and addr arguments.

**const unsigned short** * probe_addrs  
array with a list of address. The last entry at such array should be I2C_CLIENT_END.

**Description**
returns a **struct v4l2_subdev** pointer.

```c
void v4l2_i2c_subdev_init(struct v4l2_subdev * sd, struct i2c_client * client, const struct v4l2_subdev_ops * ops)
```

Initializes a **struct v4l2_subdev** with data from an i2c_client struct.

**Parameters**

- **struct v4l2_subdev** * sd  
pointer to **struct v4l2_subdev**
- **struct i2c_client** * client  
pointer to struct i2c_client
- **const struct v4l2_subdev_ops** * ops  
pointer to **struct v4l2_subdev_ops**

**unsigned short** v4l2_i2c_subdev_addr(struct v4l2_subdev * sd)

returns i2c client address of **struct v4l2_subdev**.

**Parameters**

- **struct v4l2_subdev** * sd  
pointer to **struct v4l2_subdev**

**Description**
Returns the address of an I2C sub-device

```c
struct v4l2_subdev * v4l2_spi_new_subdev(struct v4l2_device * v4l2_dev, struct spi_master * master, struct spi_board_info * info)
```

Load an spi module and return an initialized **struct v4l2_subdev**.

**Parameters**

- **struct v4l2_device** * v4l2_dev  
pointer to **struct v4l2_device**.
- **struct spi_master** * master  
pointer to struct spi_master.
- **struct spi_board_info** * info  
pointer to struct spi_board_info.

**Description**
returns a **struct v4l2_subdev** pointer.

```c
void v4l2_spi_subdev_init(struct v4l2_subdev * sd, struct spi_device * spi, const struct v4l2_subdev_ops * ops)
```

Initialize a v4l2_subdev with data from an spi_device struct.

**Parameters**

- **struct v4l2_subdev** * sd  
pointer to **struct v4l2_subdev**
- **struct spi_device** * spi  
pointer to struct spi_device.
- **const struct v4l2_subdev_ops** * ops  
pointer to **struct v4l2_subdev_ops**

**struct v4l2_ioctl_ops**
declare operations for each V4L2 ioctl

**Definition**

```c
struct v4l2_ioctl_ops {
    int (* viodic_querycap) (struct file *file, void *fh, struct v4l2_capability *cap);
    int (* viodic_enum_fmt_vid_cap) (struct file *file, void *fh,struct v4l2_fmtdesc *f);
    int (* viodic_enum_fmt_vid_overlay) (struct file *file, void *fh,struct v4l2_fmtdesc *f);

  pointer to the function that implements **VIDIOC_CREATE_BUFS** ioctl

**vidioc_prepare_buf**
• **type**: int (*)(struct file *file, void *fh, struct v4l2_buffer *b)
  pointer to the function that implements **VIDIOC_PREPARE_BUF** ioctl

**vidioc_overlay**
• **type**: int (*)(struct file *file, void *fh, unsigned int i)
  pointer to the function that implements **VIDIOC_OVERLAY** ioctl

**vidioc_g_fbuf**
• **type**: int (*)(struct file *file, void *fh, struct v4l2_framebuffer *a)
  pointer to the function that implements **VIDIOC_G_FBUF** ioctl

**vidioc_s_fbuf**
• **type**: int (*)(struct file *file, void *fh, const struct v4l2_framebuffer *a)
  pointer to the function that implements **VIDIOC_S_FBUF** ioctl

**vidioc_streamon**
• **type**: int (*)(struct file *file, void *fh, enum v4l2_buf_type i)
  pointer to the function that implements **VIDIOC_STREAMON** ioctl

**vidioc_streamoff**
• **type**: int (*)(struct file *file, void *fh, enum v4l2_buf_type i)
  pointer to the function that implements **VIDIOC_STREAMOFF** ioctl

**vidioc_g_std**
• **type**: int (*)(struct file *file, void *fh, v4l2_std_id *norm)
  pointer to the function that implements **VIDIOC_G_STD** ioctl

**vidioc_s_std**
• **type**: int (*)(struct file *file, void *fh, v4l2_std_id norm)
  pointer to the function that implements **VIDIOC_S_STD** ioctl

**vidioc_querystd**
• **type**: int (*)(struct file *file, void *fh, v4l2_std_id *a)
  pointer to the function that implements **VIDIOC_QUERYSTD** ioctl

**vidioc_enum_input**
• **type**: int (*)(struct file *file, void *fh, struct v4l2_input *inp)
  pointer to the function that implements **VIDIOC_ENUM_INPUT** ioctl

**vidioc_g_input**
• **type**: int (*)(struct file *file, void *fh, unsigned int *i)
  pointer to the function that implements **VIDIOC_G_INPUT** ioctl

**vidioc_s_input**
• **type**: int (*) (struct file *file, void *fh, unsigned int i)
  pointer to the function that implements **VIDIOC_S_INPUT** ioctl

**vidioc_enum_output**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_output *a)
  pointer to the function that implements **VIDIOC_ENUM_OUTPUT** ioctl

**vidioc_g_output**

• **type**: int (*) (struct file *file, void *fh, unsigned int *i)
  pointer to the function that implements **VIDIOC_G_OUTPUT** ioctl

**vidioc_s_output**

• **type**: int (*) (struct file *file, void *fh, unsigned int i)
  pointer to the function that implements **VIDIOC_S_OUTPUT** ioctl

**vidioc_queryctrl**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_queryctrl *a)
  pointer to the function that implements **VIDIOC_QUERYCTRL** ioctl

**vidioc_query_ext_ctrl**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_query_ext_ctrl *a)
  pointer to the function that implements **VIDIOC_QUERY_EXT_CTRL** ioctl

**vidioc_g_ctrl**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_control *a)
  pointer to the function that implements **VIDIOC_G_CTRL** ioctl

**vidioc_s_ctrl**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_control *a)
  pointer to the function that implements **VIDIOC_S_CTRL** ioctl

**vidioc_g_ext_ctrls**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_ext_controls *a)
  pointer to the function that implements **VIDIOC_G_EXT_CTRLS** ioctl

**vidioc_s_ext_ctrls**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_ext_controls *a)
  pointer to the function that implements **VIDIOC_S_EXT_CTRLS** ioctl

**vidioc_try_ext_ctrls**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_ext_controls *a)
  pointer to the function that implements **VIDIOC_TRY_EXT_CTRLS** ioctl

**vidioc_querymenu**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_querymenu *a)
  pointer to the function that implements **VIDIOC_QUERYMENU** ioctl

**vidioc_enumaudio**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_audio *a)
  pointer to the function that implements **VIDIOC_ENUMAUDIO** ioctl

**vidioc_g_audio**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_audio *a)
  pointer to the function that implements VIDIOC_G_AUDIO ioctl

**vidioc_s_audio**

• **type**: int (*) (struct file *file, void *fh, const struct v4l2_audio *a)
  pointer to the function that implements VIDIOC_S_AUDIO ioctl

**vidioc_enumaudout**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_audiout *a)
  pointer to the function that implements VIDIOC_ENUMAUDOUT ioctl

**vidioc_g_audout**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_audiout *a)
  pointer to the function that implements VIDIOC_G_AUDOUT ioctl

**vidioc_s_audout**

• **type**: int (*) (struct file *file, void *fh, const struct v4l2_audiout *a)
  pointer to the function that implements VIDIOC_S_AUDOUT ioctl

**vidioc_g_modulator**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_modulator *a)
  pointer to the function that implements VIDIOC_G_MODULATOR ioctl

**vidioc_s_modulator**

• **type**: int (*) (struct file *file, void *fh, const struct v4l2_modulator *a)
  pointer to the function that implements VIDIOC_S_MODULATOR ioctl

**vidioc_cropcap**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_cropcap *a)
  pointer to the function that implements VIDIOC_CROPCAP ioctl

**vidioc_g_crop**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_crop *a)
  pointer to the function that implements VIDIOC_G_CROP ioctl

**vidioc_s_crop**

• **type**: int (*) (struct file *file, void *fh, const struct v4l2_crop *a)
  pointer to the function that implements VIDIOC_S_CROP ioctl

**vidioc_g_selection**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_selection *s)
  pointer to the function that implements VIDIOC_G_SELECTION ioctl

**vidioc_s_selection**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_selection *s)
  pointer to the function that implements VIDIOC_S_SELECTION ioctl

**vidioc_g_jpegcomp**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_jpegcompression *a)
  pointer to the function that implements VIDIOC_G_JPEGCOMP ioctl

**vidioc_s_jpegcomp**
• **type**: int (*) (struct file *file, void *fh, const struct v4l2_jpegcompression *a)
  pointer to the function that implements **VIDIOC_S_JPEGCOMP** ioctl

**vidioc_g_enc_index**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_enc_idx *a)
  pointer to the function that implements **VIDIOC_G_ENC_INDEX** ioctl

**vidioc_encoder_cmd**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_encoder_cmd *a)
  pointer to the function that implements **VIDIOC_ENCODER_CMD** ioctl

**vidioc_try_encoder_cmd**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_encoder_cmd *a)
  pointer to the function that implements **VIDIOC_TRY_ENCODER_CMD** ioctl

**vidioc_decoder_cmd**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_decoder_cmd *a)
  pointer to the function that implements **VIDIOC_DECODER_CMD** ioctl

**vidioc_try_decoder_cmd**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_decoder_cmd *a)
  pointer to the function that implements **VIDIOC_TRY_DECODER_CMD** ioctl

**vidioc_g_parm**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_streamparm *a)
  pointer to the function that implements **VIDIOC_G_PARM** ioctl

**vidioc_s_parm**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_streamparm *a)
  pointer to the function that implements **VIDIOC_S_PARM** ioctl

**vidioc_g_tuner**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_tuner *a)
  pointer to the function that implements **VIDIOC_G_TUNER** ioctl

**vidioc_s_tuner**
• **type**: int (*) (struct file *file, void *fh, const struct v4l2_tuner *a)
  pointer to the function that implements **VIDIOC_S_TUNER** ioctl

**vidioc_g_frequency**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_frequency *a)
  pointer to the function that implements **VIDIOC_G_FREQUENCY** ioctl

**vidioc_s_frequency**
• **type**: int (*) (struct file *file, void *fh, const struct v4l2_frequency *a)
  pointer to the function that implements **VIDIOC_S_FREQUENCY** ioctl

**vidioc_enum_freq_bands**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_frequency_band *band)
  pointer to the function that implements **VIDIOC_ENUM_FREQ_BANDS** ioctl

**vidioc_g_sliced_vbi_cap**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_sliced_vbi_cap *a)
  pointer to the function that implements **VIDIOC_G_SLICED_VBI_CAP** ioctl

**vidioc_log_status**

• **type**: int (*) (struct file *file, void *fh)
  pointer to the function that implements **VIDIOC_LOG_STATUS** ioctl

**vidioc_s_hw_freq_seek**

• **type**: int (*) (struct file *file, void *fh, const struct v4l2_hw_freq_seek *a)
  pointer to the function that implements **VIDIOC_S_HW_FREQ_SEEK** ioctl

**vidioc_g_register**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_dbg_register *reg)
  pointer to the function that implements **VIDIOC_DBG_G_REGISTER** ioctl

**vidioc_s_register**

• **type**: int (*) (struct file *file, void *fh, const struct v4l2_dbg_register *reg)
  pointer to the function that implements **VIDIOC_DBG_S_REGISTER** ioctl

**vidioc_g_chip_info**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_dbg_chip_info *chip)
  pointer to the function that implements **VIDIOC_DBG_G_CHIP_INFO** ioctl

**vidioc_enum_framesizes**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_frmsizeenum *fsize)
  pointer to the function that implements **VIDIOC_ENUM_FRAMESIZES** ioctl

**vidioc_enum_frameintervals**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_frmivalenum *fival)
  pointer to the function that implements **VIDIOC_ENUM_FRAMEINTERVALS** ioctl

**vidioc_s_dv_timings**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_dv_timings *timings)
  pointer to the function that implements **VIDIOC_S_DV_TIMINGS** ioctl

**vidioc_g_dv_timings**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_dv_timings *timings)
  pointer to the function that implements **VIDIOC_G_DV_TIMINGS** ioctl

**vidioc_query_dv_timings**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_dv_timings *timings)
  pointer to the function that implements **VIDIOC_QUERY_DV_TIMINGS** ioctl

**vidioc_enum_dv_timings**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_enum_dv_timings *timings)
  pointer to the function that implements **VIDIOC_ENUM_DV_TIMINGS** ioctl

**vidioc_dv_timings_cap**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_dv_timings_cap *cap)
  pointer to the function that implements **VIDIOC_DV_TIMINGS_CAP** ioctl

**vidioc_g_edid**
• **type**: int (*) (struct file *file, void *fh, struct v4l2_edid *edid)
  pointer to the function that implements **VIDIOC_G_EDID** ioctl

**vidioc_s_edid**

• **type**: int (*) (struct file *file, void *fh, struct v4l2_edid *edid)
  pointer to the function that implements **VIDIOC_S_EDID** ioctl

**vidioc_subscribe_event**

• **type**: int (*) (struct v4l2_fh *fh, const struct v4l2_event_subscription *sub)
  pointer to the function that implements **VIDIOC_SUBSCRIBE_EVENT** ioctl

**vidioc_unsubscribe_event**

• **type**: int (*)(struct v4l2_fh *fh, const struct v4l2_event_subscription *sub)
  pointer to the function that implements **VIDIOC_UNSUBSCRIBE_EVENT** ioctl

**vidioc_default**

• **type**: long (*)(struct file *file, void *fh, bool valid_prio, unsigned int cmd, void *arg)
  pointed used to allow other ioctls

### 2.1.25 Hauppauge TV EEPROM functions and data structures

**enum tveeprom_audio_processor**

Specifies the type of audio processor used on a Hauppauge device.

**Constants**

**TVEEPROM_AUDPROC_NONE** No audio processor present

**TVEEPROM_AUDPROC_INTERNAL** The audio processor is internal to the video processor

**TVEEPROM_AUDPROC_MSP** The audio processor is a MSPXXXX device

**TVEEPROM_AUDPROC_OTHER** The audio processor is another device

**struct tveeprom**

Contains the fields parsed from Hauppauge eeproms

**Definition**

```c
struct tveeprom {
    u32 has_radio;
    u32 has_ir;
    u32 has_MAC_address;
    u32 tuner_type;
    u32 tuner_formats;
    u32 tuner_hauppauge_model;
    u32 tuner2_type;
    u32 tuner2_formats;
    u32 tuner2_hauppauge_model;
    u32 audio_processor;
    u32 decoder_processor;
    u32 model;
    u32 revision;
    u32 serial_number;
    char rev_str[5];
    u8 MAC_address[ETH_ALEN];
};
```

**Members**

726 Chapter 2. Media subsystem kernel internal API
has_radio
  • type: u32
  1 if the device has radio; 0 otherwise.

has_ir
  • type: u32
  If has_ir == 0, then it is unknown what the IR capabilities are. Otherwise: bit 0) 1 (= IR capabilities are known); bit 1) IR receiver present; bit 2) IR transmitter (blaster) present.

has_MAC_address
  • type: u32
  0: no MAC, 1: MAC present, 2: unknown.

tuner_type
  • type: u32
  type of the tuner (TUNER_*, as defined at include/media/tuner.h).

tuner_formats
  • type: u32
  Supported analog TV standards (V4L2_STD_*).

tuner_hauppauge_model
  • type: u32
  Hauppauge’s code for the device model number.

tuner2_type
  • type: u32
  type of the second tuner (TUNER_*, as defined at include/media/tuner.h).

tuner2_formats
  • type: u32
  Tuner 2 supported analog TV standards (V4L2_STD_*).

tuner2_hauppauge_model
  • type: u32
  tuner 2 Hauppauge’s code for the device model number.

audio_processor
  • type: u32
  analog audio decoder, as defined by enum tveeprom_audio_processor.

decoder_processor
  • type: u32
  Hauppauge’s code for the decoder chipset. Unused by the drivers, as they probe the decoder based on the PCI or USB ID.

model
  • type: u32
  Hauppauge’s model number

revision
  • type: u32
Card revision number

**serial_number**
- **type**: u32
  Card’s serial number

**rev_str[5]**
- **type**: char
  Card revision converted to number

**MAC_address[ETH_ALEN]**
- **type**: u8
  MAC address for the network interface

```c
void tveeprom_hauppauge_analog(struct i2c_client * c, struct tveeprom * tvee, unsigned char * eeprom_data)
```

Fill struct tveeprom using the contents of the eeprom previously filled at `eeprom_data` field.

**Parameters**
- `struct i2c_client * c` I2C client struct
- `struct tveeprom * tvee` Struct to where the eeprom parsed data will be filled;
- `unsigned char * eeprom_data` Array with the contents of the eeprom_data. It should contain 256 bytes filled with the contents of the eeprom read from the Hauppauge device.

```c
int tveeprom_read(struct i2c_client * c, unsigned char * eedata, int len)
```

Reads the contents of the eeprom found at the Hauppauge devices.

**Parameters**
- `struct i2c_client * c` I2C client struct
- `unsigned char * eedata` Array where the eeprom content will be stored.
- `int len` Size of `eedata` array. If the eeprom content will be latter be parsed by `tveeprom_hauppauge_analog()`, `len` should be, at least, 256.

## 2.2 Digital TV (DVB) devices

## 2.3 Digital TV Common functions

```c
unsigned int intlog2(u32 value)
```

computes log2 of a value; the result is shifted left by 24 bits

**Parameters**
- `u32 value` The value (must be != 0)

**Description**

to use rational values you can use the following method:

```c
intlog2(value) = intlog2(value * 2^x) - x * 2^24
```

Some usecase examples:

- `intlog2(8)` will give 3 \(<<\) 24 = 3 \(\times\) 2^24
- `intlog2(9)` will give 3 \(<<\) 24 + ... = 3.16... \(\times\) 2^24
- `intlog2(1.5)` = intlog2(3) - 2^24 = 0.584... \(\times\) 2^24

728 Chapter 2. Media subsystem kernel internal API
Return

log2(value) * 2^24

unsigned int intlog10(u32 value)
    computes log10 of a value; the result is shifted left by 24 bits

Parameters

u32 value The value (must be != 0)

Description

to use rational values you can use the following method:

    intlog10(value) = intlog10(value * 10^x) - x * 2^24

An usecase example:

    intlog10(1000) will give 3 << 24 = 3 * 2^24

due to the implementation intlog10(1000) might be not exactly 3 * 2^24

look at intlog2 for similar examples

Return

log10(value) * 2^24

ssize_t dvb_ringbuffer_pkt_write(struct dvb_ringbuffer * rbuf, u8 * buf, size_t len)
    Write a packet into the ringbuffer.

Parameters

struct dvb_ringbuffer * rbuf Ringbuffer to write to.

u8 * buf Buffer to write.

size_t len Length of buffer (currently limited to 65535 bytes max). returns Number of bytes written, or -EFAULT, -ENOMEM, -EVALID.

ssize_t dvb_ringbuffer_pkt_read_user(struct dvb_ringbuffer * rbuf, size_t idx, int offset, u8 __user * buf, size_t len)
    Read from a packet in the ringbuffer.

Parameters

struct dvb_ringbuffer * rbuf Ringbuffer concerned.

size_t idx Packet index as returned by dvb_ringbuffer_pkt_next().

int offset Offset into packet to read from.

u8 __user * buf Destination buffer for data.

size_t len Size of destination buffer.

Description

returns Number of bytes read, or -EFAULT.

Note:

Unlike dvb_ringbuffer_read(), this does NOT update the read pointer in the ringbuffer. You must use dvb_ringbuffer_pkt_dispose() to mark a packet as no longer required.

ssize_t dvb_ringbuffer_pkt_read(struct dvb_ringbuffer * rbuf, size_t idx, int offset, u8 * buf, size_t len)    
    Read from a packet in the ringbuffer.

Parameters

2.3. Digital TV Common functions
struct dvb_ringbuffer * rbuf  Ringbuffer concerned.
size_t idx  Packet index as returned by dvb_ringbuffer_pkt_next().
int offset  Offset into packet to read from.
u8 * buf  Destination buffer for data.
size_t len  Size of destination buffer.

**Note**

Unlike dvb_ringbuffer_read_user(), this DOES update the read pointer in the ring buffer.

**Description**

Returns number of bytes read, or -EFAULT.

```c
void dvb_ringbuffer_pkt_dispose(struct dvb_ringbuffer * rbuf, size_t idx)
    Dispose of a packet in the ring buffer.
```

**Parameters**

- **struct dvb_ringbuffer * rbuf**  Ring buffer concerned.
- **size_t idx**  Packet index as returned by dvb_ringbuffer_pkt_next().

```c
ssize_t dvb_ringbuffer_pkt_next(struct dvb_ringbuffer * rbuf, size_t idx, size_t * pktlen)
    Get the index of the next packet in a ringbuffer.
```

**Parameters**

- **struct dvb_ringbuffer * rbuf**  Ringbuffer concerned.
- **size_t idx**  Previous packet index, or -1 to return the first packet index.
- **size_t * pktlen**  On success, will be updated to contain the length of the packet in bytes. Returns packet index (if >=0), or -1 if no packets available.

**struct dvb_adapter**

Represents a Digital TV adapter using Linux DVB API

**Definition**

```c
struct dvb_adapter {
    int num;
    struct list_head list_head;
    struct list_head device_list;
    const char * name;
    u8 proposed_mac[6];
    void * priv;
    struct device * device;
    struct module * module;
    int mfe_shared;
    struct dvb_device * mfe_dvbdev;
    struct mutex mfe_lock;
    #if defined(CONFIG_MEDIA_CONTROLLER_DVB)
        struct media_device * mdev;
        struct media_entity * conn;
        struct media_pad * conn_pads;
    #endif
};
```

**Members**

- **num**  
  
  • **type**: int
  
  Number of the adapter
list_head
  • **type**: struct list_head
  List with the DVB adapters
device_list
  • **type**: struct list_head
  List with the DVB devices
name
  • **type**: const char *
  Name of the adapter
proposed_mac[6]
  • **type**: u8
  proposed MAC address for the adapter
priv
  • **type**: void *
  private data
device
  • **type**: struct device *
  pointer to struct device
module
  • **type**: struct module *
  pointer to struct module
mfe_shared
  • **type**: int
  mfe shared: indicates mutually exclusive frontends. The usage of this flag is currently deprecated
mfe_dvbdev
  • **type**: struct dvb_device *
  Frontend device in use, in the case of MFE
mfe_lock
  • **type**: struct mutex
  Lock to prevent using the other frontends when MFE is used.
mdev
  • **type**: struct media_device *
  pointer to struct media_device, used when the media controller is used.
conn
  • **type**: struct media_entity *
  RF connector. Used only if the device has no separate tuner.
conn_pads
  • **type**: struct media_pad *
  pointer to struct media_pad associated with conn;
struct **dvb_device**

represents a DVB device node

**Definition**

```c
struct dvb_device {
    struct list_head list_head;
    const struct file_operations * fops;
    struct dvb_adapter * adapter;
    int type;
    int minor;
    u32 id;
    int readers;
    int writers;
    int users;
    wait_queue_head_t wait_queue;
    int (* kernel_ioctl) (struct file *file, unsigned int cmd, void *arg);
#if defined(CONFIG_MEDIA_CONTROLLER_DVB)
    const char * name;
    struct media_intf_devnode * intf_devnode;
    unsigned tsout_num_entities;
    struct media_entity * entity;
    struct media_entity * tsout_entity;
    struct media_pad * pads;
    struct media_pad * tsout_pads;
#endif
    void * priv;
};
```

**Members**

**list_head**

- **type**: struct list_head
  
  List head with all DVB devices

**fops**

- **type**: const struct file_operations *
  
  pointer to struct file_operations

**adapter**

- **type**: struct dvb_adapter *
  
  pointer to the adapter that holds this device node

**type**

- **type**: int
  
  type of the device:  
  `DVBDEVICE_SEC`, `DVBDEVICE_FRONTEND`, `DVBDEVICE_DEMUX`,  
  `DVBDEVICE_DVR`, `DVBDEVICE_CA`, `DVBDEVICE_NET`

**minor**

- **type**: int
  
  devnode minor number. Major number is always DVB_MAJOR.

**id**

- **type**: u32
  
  device ID number, inside the adapter

**readers**

- **type**: int
Initialized by the caller. Each call to `open()` in Read Only mode decreases this counter by one.

**writers**
- **type**: int
  Initialized by the caller. Each call to `open()` in Read/Write mode decreases this counter by one.

**users**
- **type**: int
  Initialized by the caller. Each call to `open()` in any mode decreases this counter by one.

**wait_queue**
- **type**: wait_queue_head_t
  wait queue, used to wait for certain events inside one of the DVB API callers

**kernel_ioctl**
- **type**: int (*)(struct file *file,unsigned int cmd,void *arg)
  callback function used to handle ioctl calls from userspace.

**name**
- **type**: const char *
  Name to be used for the device at the Media Controller

**intf_devnode**
- **type**: struct media_intf_devnode *
  Pointer to media_intf_devnode. Used by the dvbdev core to store the MC device node interface

**tsout_num_entities**
- **type**: unsigned
  Number of Transport Stream output entities

**entity**
- **type**: struct media_entity *
  pointer to struct media_entity associated with the device node

**tsout_entity**
- **type**: struct media_entity *
  array with MC entities associated to each TS output node

**pads**
- **type**: struct media_pad *
  pointer to struct media_pad associated with **entity**;

**tsout_pads**
- **type**: struct media_pad *
  array with the source pads for each **tsout_entity**

**priv**
- **type**: void *
  private data
### Description
This structure is used by the DVB core (frontend, CA, net, demux) in order to create the device nodes. Usually, driver should not initialize this struct directly.

```c
int dvb_register_adapter(struct dvb_adapter * adap, const char * name, struct module * module, struct device * device, short * adapter_nums)
```

Registers a new DVB adapter

#### Parameters
- `struct dvb_adapter * adap` pointer to struct dvb_adapter
- `const char * name` Adapter’s name
- `struct module * module` initialized with THIS_MODULE at the caller
- `struct device * device` pointer to struct device that corresponds to the device driver
- `short * adapter_nums` Array with a list of the numbers for dvb_register_adapter; to select among them. Typically, initialized with: DVB_DEFINE_MOD_OPT_ADAPTER_NR(adapter_nums)

```c
int dvb_unregister_adapter(struct dvb_adapter * adap)
```

Unregisters a DVB adapter

#### Parameters
- `struct dvb_adapter * adap` pointer to struct dvb_adapter

```c
int dvb_register_device(struct dvb_adapter * adap, struct dvb_device ** pdvbdev, const struct dvb_device * template, void * priv, int type, int demux_sink_pads)
```

Registers a new DVB device

#### Parameters
- `struct dvb_adapter * adap` pointer to struct dvb_adapter
- `struct dvb_device ** pdvbdev` pointer to the place where the new struct dvb_device will be stored
- `const struct dvb_device * template` Template used to create pdvbdev;
- `void * priv` private data
- `int type` type of the device: DVB_DEVICE_SEC, DVB_DEVICE_FRONTEND, DVB_DEVICE_DEMUX, DVB_DEVICE_DVR, DVB_DEVICE_CA, DVB_DEVICE_NET
- `int demux_sink_pads` Number of demux outputs, to be used to create the TS outputs via the Media Controller.

```c
void dvb_unregister_device(struct dvb_device * dvbdev)
```

Unregisters a DVB device

#### Parameters
- `struct dvb_device * dvbdev` pointer to struct dvb_device

```c
int dvb_create_media_graph(struct dvb_adapter * adap, bool create_rf_connector)
```

Creates media graph for the Digital TV part of the device.

#### Parameters
- `struct dvb_adapter * adap` pointer to struct dvb_adapter
- `bool create_rf_connector` if true, it creates the RF connector too

### Description
This function checks all DVB-related functions at the media controller entities and creates the needed links for the media graph. It is capable of working with multiple tuners or multiple frontends, but it won’t create links if the device has multiple tuners and multiple frontends or if the device has multiple muxes. In such case, the caller driver should manually create the remaining links.
unsigned int \textbf{intlog2}\textup{(u32 value)}
computes \(\log_2\) of a value; the result is shifted left by 24 bits

\textbf{Parameters}
\textbf{u32 value} The value (must be \(!= 0\))

\textbf{Description}
to use rational values you can use the following method:
\[\text{intlog2(value)} = \text{intlog2(value} \times 2^x) - x \times 2^{24}\]
Some usecase examples:
\[\text{intlog2}(8) \text{ will give } 3 \ll 24 = 3 \times 2^{24}\]
\[\text{intlog2}(9) \text{ will give } 3 \ll 24 + \ldots = 3.16\ldots \times 2^{24}\]
\[\text{intlog2}(1.5) = \text{intlog2}(3) - 2^{24} = 0.584\ldots \times 2^{24}\]

\textbf{Return}
\(\log_2(\text{value}) \times 2^{24}\)

unsigned int \textbf{intlog10}\textup{(u32 value)}
computes \(\log_{10}\) of a value; the result is shifted left by 24 bits

\textbf{Parameters}
\textbf{u32 value} The value (must be \(!= 0\))

\textbf{Description}
to use rational values you can use the following method:
\[\text{intlog10(value)} = \text{intlog10(value} \times 10^x) - x \times 2^{24}\]
An usecase example:
\[\text{intlog10}(1000) \text{ will give } 3 \ll 24 = 3 \times 2^{24}\]
due to the implementation intlog10(1000) might be not exactly \(3 \times 2^{24}\)
look at intlog2 for similar examples

\textbf{Return}
\(\log_{10}(\text{value}) \times 2^{24}\)

\begin{verbatim}
int \textbf{dvb_register_adapter}\textup{(struct dvb_adapter * adap, const char * name, struct module * module, 
               struct device * device, short * adapter_nums)}

Registers a new DVB adapter

\textbf{Parameters}
\textbf{struct dvb_adapter * adap} pointer to \texttt{struct dvb_adapter}
\textbf{const char * name} Adapter’s name
\textbf{struct module * module} initialized with \texttt{THIS_MODULE} at the caller
\textbf{struct device * device} pointer to \texttt{struct device} that corresponds to the device driver
\textbf{short * adapter_nums} Array with a list of the numbers for \texttt{dvb_register_adapter}; to select among them. Typically, initialized with: \texttt{DVB_DEFINE_MOD_OPT_ADAPTER_NR(adapter_nums)}
\begin{verbatim}
int \textbf{dvb_unregister_adapter}\textup{(struct dvb_adapter * adap)}

Unregisters a DVB adapter

\textbf{Parameters}
\textbf{struct dvb_adapter * adap} pointer to \texttt{struct dvb_adapter}
\end{verbatim}
\end{verbatim}
int `dvb_register_device`(struct `dvb_adapter` * `adap`, struct `dvb_device` **`pdvbdev`, const struct `dvb_device` * `template`, void * `priv`, int `type`, int `demux_sink_pads`)  

Registers a new DVB device

**Parameters**

- **struct dvb_adapter** * `adap` pointer to struct dvb_adapter
- **struct dvb_device** ** `pdvbdev` pointer to the place where the new struct dvb_device will be stored
- **const struct dvb_device** * `template` Template used to create `pdvbdev`
- **void** * `priv` private data
- **int** `type` type of the device: `DVB_DEVICE_SEC`, `DVB_DEVICE_FRONTEND`, `DVB_DEVICE_DEMUX`, `DVB_DEVICE_DVR`, `DVB_DEVICE_CA`, `DVB_DEVICE_NET`  

- **int** `demux_sink_pads` Number of demux outputs, to be used to create the TS outputs via the Media Controller.

void `dvb_unregister_device`(struct `dvb_device` * `dvbdev`)  

Unregisters a DVB device

**Parameters**

- **struct dvb_device** * `dvbdev` pointer to struct dvb_device

int `dvb_create_media_graph`(struct `dvb_adapter` * `adap`, bool `create_rf_connector`)  

Creates media graph for the Digital TV part of the device.

**Parameters**

- **struct dvb_adapter** * `adap` pointer to struct dvb_adapter
- **bool** `create_rf_connector` if true, it creates the RF connector too

**Description**

This function checks all DVB-related functions at the media controller entities and creates the needed links for the media graph. It is capable of working with multiple tuners or multiple frontends, but it won’t create links if the device has multiple tuners and multiple frontends or if the device has multiple muxes. In such case, the caller driver should manually create the remaining links.

### 2.4 Digital TV Frontend kABI

#### 2.4.1 Digital TV Frontend

The Digital TV Frontend kABI defines a driver-internal interface for registering low-level, hardware specific driver to a hardware independent frontend layer. It is only of interest for Digital TV device driver writers. The header file for this API is named dvb_frontend.h and located in drivers/media/dvb-core.

Before using the Digital TV frontend core, the bridge driver should attach the frontend demod, tuner and SEC devices and call `dvb_register_frontend()`, in order to register the new frontend at the subsystem. At device detach/removal, the bridge driver should call `dvb_unregister_frontend()` to remove the frontend from the core and then `dvb_frontend_detach()` to free the memory allocated by the frontend drivers.

The drivers should also call `dvb_frontend_suspend()` as part of their handler for the device_driver.suspend(), and `dvb_frontend_resume()` as part of their handler for device_driver.resume().

A few other optional functions are provided to handle some special cases.

- **struct dvb_frontend_tune_settings** parameters to adjust frontend tuning
Definition

```c
struct dvb_frontend_tune_settings {
    int min_delay_ms;
    int step_size;
    int max_drift;
};
```

Members

- **min_delay_ms**
  - Type: int
  - Minimum delay for tuning, in ms

- **step_size**
  - Type: int
  - Step size between two consecutive frequencies

- **max_drift**
  - Type: int
  - Maximum drift

**NOTE**

Step_size is in Hz, for terrestrial/cable or kHz for satellite

Definition

```c
struct dvb_tuner_info {
    char name[128];
    u32 frequency_min;
    u32 frequency_max;
    u32 frequency_step;
    u32 bandwidth_min;
    u32 bandwidth_max;
    u32 bandwidth_step;
};
```

Members

- **name[128]**
  - Type: char
  - Name of the Frontend

- **frequency_min**
  - Type: u32
  - Minimal frequency supported

- **frequency_max**
  - Type: u32
  - Maximum frequency supported

- **frequency_step**
  - Type: u32
  - Frequency step

2.4. Digital TV Frontend kABI
bandwidth_min
   • type: u32
   minimal frontend bandwidth supported

bandwidth_max
   • type: u32
   maximum frontend bandwidth supported

bandwidth_step
   • type: u32
   frontend bandwidth step

NOTE
frequency parameters are in Hz, for terrestrial/cable or kHz for satellite.

struct analog_parameters
   Parameters to tune into an analog/radio channel

Definition

struct analog_parameters {
   unsigned int frequency;
   unsigned int mode;
   unsigned int audmode;
   u64 std;
};

Members

frequency
   • type: unsigned int
   Frequency used by analog TV tuner (either in 62.5 kHz step, for TV, or 62.5 Hz for radio)

mode
   • type: unsigned int
   Tuner mode, as defined on enum v4l2_tuner_type

audmode
   • type: unsigned int
   Audio mode as defined for the rxsubchans field at videodev2.h, e. g. V4L2_TUNER_MODE_*

std
   • type: u64
   TV standard bitmap as defined at videodev2.h, e. g. V4L2_STD_*

Description
Hybrid tuners should be supported by both V4L2 and DVB APIs. This struct contains the data that are used by the V4L2 side. To avoid dependencies from V4L2 headers, all enums here are declared as integers.

enum dvbfe_algo
   defines the algorithm used to tune into a channel

Constants

DVBFE_ALGO_HW Hardware Algorithm - Devices that support this algorithm do everything in hardware and no software support is needed to handle them. Requesting these devices to LOCK is the only thing required, device is supposed to do everything in the hardware.
**DVBFE_ALGO_SW** Software Algorithm - These are dumb devices, that require software to do everything

**DVBFE_ALGO_CUSTOM** Customizable Algorithm - Devices having this algorithm can be customized to have specific algorithms in the frontend driver, rather than simply doing a software zig-zag. In this case the zigzag maybe hardware assisted or it maybe completely done in hardware. In all cases, usage of this algorithm, in conjunction with the search and track callbacks, utilizes the driver specific algorithm.

**DVBFE_ALGO_RECOVERY** Recovery Algorithm - These devices have AUTO recovery capabilities from LOCK failure

```c
enum dvbfe_search
  search callback possible return status

Constants

**DVBFE_ALGO_SEARCH_SUCCESS** The frontend search algorithm completed and returned successfully

**DVBFE_ALGO_SEARCH_ASLEEP** The frontend search algorithm is sleeping

**DVBFE_ALGO_SEARCH_FAILED** The frontend search for a signal failed

**DVBFE_ALGO_SEARCH_INVALID** The frontend search algorithm was probably supplied with invalid parameters and the search is an invalid one

**DVBFE_ALGO_SEARCH_AGAIN** The frontend search algorithm was requested to search again

**DVBFE_ALGO_SEARCH_ERROR** The frontend search algorithm failed due to some error
```

**struct dvb_tuner_ops**
  Tuner information and callbacks

**Definition**

```c
struct dvb_tuner_ops {
  struct dvb_tuner_info info;
  int (* release) (struct dvb_frontend *fe);
  int (* init) (struct dvb_frontend *fe);
  int (* sleep) (struct dvb_frontend *fe);
  int (* suspend) (struct dvb_frontend *fe);
  int (* resume) (struct dvb_frontend *fe);
  int (* set_params) (struct dvb_frontend *fe);
  int (* set_analog_params) (struct dvb_frontend *fe, struct analog_parameters *p);
  int (* set_config) (struct dvb_frontend *fe, void *priv_cfg);
  int (* get_frequency) (struct dvb_frontend *fe, u32 *frequency);
  int (* get_bandwidth) (struct dvb_frontend *fe, u32 *bandwidth);
  int (* get_if_frequency) (struct dvb_frontend *fe, u32 *frequency);
  #define TUNER_STATUS_LOCKED 1
  #define TUNER_STATUS_STEREO 2
  int (* get_status) (struct dvb_frontend *fe, u32 *status);
  int (* get_rf_strength) (struct dvb_frontend *fe, u16 *strength);
  int (* get_afc) (struct dvb_frontend *fe, s32 *afc);
  int (* calc_regs) (struct dvb_frontend *fe, u8 *buf, int buf_len);
  int (* set_frequency) (struct dvb_frontend *fe, u32 frequency);
  int (* set_bandwidth) (struct dvb_frontend *fe, u32 bandwidth);
};
```

**Members**

- **info**
  - **type:** struct dvb_tuner_info
    - embedded struct dvb_tuner_info with tuner properties

- **release**
  - **type:** int (*)(struct dvb_frontend *fe)
    - callback function called when frontend is detached. drivers should free any allocated memory.
init
  • **type**: int (*)(struct dvb_frontend *fe)
    callback function used to initialize the tuner device.

sleep
  • **type**: int (*)(struct dvb_frontend *fe)
    callback function used to put the tuner to sleep.

suspend
  • **type**: int (*)(struct dvb_frontend *fe)
    callback function used to inform that the Kernel will suspend.

resume
  • **type**: int (*)(struct dvb_frontend *fe)
    callback function used to inform that the Kernel is resuming from suspend.

set_params
  • **type**: int (*)(struct dvb_frontend *fe)
    callback function used to inform the tuner to tune into a digital TV channel. The properties to be used are stored at `dvb_frontend.dtv_property_cache`. The tuner demod can change the parameters to reflect the changes needed for the channel to be tuned, and update statistics. This is the recommended way to set the tuner parameters and should be used on newer drivers.

set_analog_params
  • **type**: int (*)(struct dvb_frontend *fe,struct analog_parameters *p)
    callback function used to tune into an analog TV channel on hybrid tuners. It passes `analog_parameters` to the driver.

set_config
  • **type**: int (*)(struct dvb_frontend *fe,void *priv_cfg)
    callback function used to send some tuner-specific parameters.

get_frequency
  • **type**: int (*)(struct dvb_frontend *fe,u32 *frequency)
    get the actual tuned frequency

get_bandwidth
  • **type**: int (*)(struct dvb_frontend *fe,u32 *bandwidth)
    get the bandwidth used by the low pass filters

get_if_frequency
  • **type**: int (*)(struct dvb_frontend *fe,u32 *frequency)
    get the Intermediate Frequency, in Hz. For baseband, should return 0.

get_status
  • **type**: int (*)(struct dvb_frontend *fe,u32 *status)
    returns the frontend lock status

get_rf_strength
  • **type**: int (*)(struct dvb_frontend *fe,u16 *strength)
    returns the RF signal strength. Used mostly to support analog TV and radio. Digital TV should report, instead, via DVBv5 API (`dvb_frontend.dtv_property_cache`);
getafc

- **type**: int (*)(struct dvb_frontend *fe, s32 *afc)
  
  Used only by analog TV core. Reports the frequency drift due to AFC.

calc_regs

- **type**: int (*)(struct dvb_frontend *fe, u8 *buf, int buf_len)
  
  Callback function used to pass register data settings for simple tuners. Shouldn’t be used on newer drivers.

set_frequency

- **type**: int (*)(struct dvb_frontend *fe, u32 frequency)
  
  Set a new frequency. Shouldn’t be used on newer drivers.

set_bandwidth

- **type**: int (*)(struct dvb_frontend *fe, u32 bandwidth)
  
  Set a new frequency. Shouldn’t be used on newer drivers.

**NOTE**

frequencies used on get_frequency and set_frequency are in Hz for terrestrial/cable or kHz for satellite.

struct **analog_demod_info**

Information struct for analog TV part of the demod

**Definition**

```c
struct analog_demod_info {
    char * name;
};
```

**Members**

name

- **type**: char *
  
  Name of the analog TV demodulator

struct **analog_demod_ops**

Demodulation information and callbacks for analog TV and radio

**Definition**

```c
struct analog_demod_ops {
    struct analog_demod_info info;
    void (* set_params) (struct dvb_frontend *fe, struct analog_parameters *params);
    int (* has_signal) (struct dvb_frontend *fe, u16 *signal);
    int (* get_afc) (struct dvb_frontend *fe, s32 *afc);
    void (* tuner_status) (struct dvb_frontend *fe);
    void (* standby) (struct dvb_frontend *fe);
    void (* release) (struct dvb_frontend *fe);
    int (* i2c_gate_ctrl) (struct dvb_frontend *fe, int enable);
    int (* set_config) (struct dvb_frontend *fe, void *priv_cfg);
};
```

**Members**

info

- **type**: struct analog_demod_info
  
  Pointer to struct analog_demod_info

set_params
• **type**: void (*)(struct dvb_frontend *fe, struct analog_parameters *params)
  callback function used to inform the demod to set the demodulator parameters needed to decode an analog or radio channel. The properties are passed via struct **analog_params**;

**has_signal**

• **type**: int (*)(struct dvb_frontend *fe, u16 *signal)
  returns 0xffff if has signal, or 0 if it doesn’t.

**get_afc**

• **type**: int (*)(struct dvb_frontend *fe, s32 *afc)
  Used only by analog TV core. Reports the frequency drift due to AFC.

**tuner_status**

• **type**: void (*)(struct dvb_frontend *fe)
  callback function that returns tuner status bits, e. g. TUNER_STATUS_LOCKED and TUNER_STATUS_STEREO.

**standby**

• **type**: void (*)(struct dvb_frontend *fe)
  set the tuner to standby mode.

**release**

• **type**: void (*)(struct dvb_frontend *fe)
  callback function called when frontend is detached. drivers should free any allocated memory.

**i2c_gate_ctrl**

• **type**: int (*)(struct dvb_frontend *fe, int enable)
  controls the I2C gate. Newer drivers should use I2C mux support instead.

**set_config**

• **type**: int (*)(struct dvb_frontend *fe, void *priv_cfg)
  callback function used to send some tuner-specific parameters.

**struct dvb_frontend_ops**

Demodulation information and callbacks for digital TV

**Definition**

```c
struct dvb_frontend_ops {
    struct dvb_frontend_info info;
    u8 delsys[MAX_DELSYS];
    void (*release)(struct dvb_frontend* fe);
    void (*release_sec)(struct dvb_frontend* fe);
    int (*init)(struct dvb_frontend* fe);
    int (*sleep)(struct dvb_frontend* fe);
    int (*write)(struct dvb_frontend* fe, const u8 buf[], int len);
    int (*tune)(struct dvb_frontend* fe, bool re_tune,unsigned int mode_flags,unsigned int *delay,enum fe_status *status);
    enum dvbfe_algo (*get_frontend_algo)(struct dvb_frontend *fe);
    int (*set_frontend)(struct dvb_frontend *fe);
    int (*get_tune_settings)(struct dvb_frontend* fe, struct dvb_frontend_tune_settings* settings);
    int (*get_frontend)(struct dvb_frontend *fe, struct dtv_frontend_properties *props);
    int (*read_status)(struct dvb_frontend *fe, enum fe_status *status);
    int (*read_ber)(struct dvb_frontend* fe, u32* ber);
    int (*read_signal_strength)(struct dvb_frontend* fe, u16* strength);
    int (*read_snr)(struct dvb_frontend* fe, u16* snr);
};
```
```c
int (* read_ucblocks) (struct dvb_frontend* fe, u32* ucblocks);
int (* diseqc_reset_overload) (struct dvb_frontend* fe);
int (* diseqc_send_master_cmd) (struct dvb_frontend* fe, struct dvb_diseqc_master_cmd* cmd);
int (* diseqc_send_slave_reply) (struct dvb_frontend* fe, struct dvb_diseqc_slave_reply* reply);
int (* diseqc_send_burst) (struct dvb_frontend *fe,enum fe_sec_mini_cmd minicmd);
int (* set_tone) (struct dvb_frontend *fe, enum fe_sec_tone_mode tone);
int (* set_voltage) (struct dvb_frontend *fe,enum fe_sec_voltage voltage);
int (* enable_high_lnb_voltage) (struct dvb_frontend* fe, long arg);
int (* dishnetwork_send_legacy_command) (struct dvb_frontend* fe, unsigned long cmd);
int (* i2c_gate_ctrl) (struct dvb_frontend* fe, int enable);
int (* ts_bus_ctrl) (struct dvb_frontend* fe, int acquire);
int (* set_lna) (struct dvb_frontend *);
enum dvbfe_search (* search) (struct dvb_frontend *fe);
struct dvb_tuner_ops tuner_ops;
struct analog_demod_ops analog_ops;
int (* set_property) (struct dvb_frontend* fe, struct dtv_property* tvp);
int (* get_property) (struct dvb_frontend* fe, struct dtv_property* tvp);
};
```

### Members

- **info**
  - type: struct dvb_frontend_info
    - embedded struct dvb_tuner_info with tuner properties

- **delsys[MAX_DELSYS]**
  - type: u8
    - Delivery systems supported by the frontend

- **release**
  - type: void (*)(struct dvb_frontend* fe)
    - callback function called when frontend is detached. drivers should free any allocated memory.

- **release_sec**
  - type: void (*)(struct dvb_frontend* fe)
    - callback function requesting that the Satelite Equipment Control (SEC) driver to release and free any memory allocated by the driver.

- **init**
  - type: int (*)(struct dvb_frontend* fe)
    - callback function used to initialize the tuner device.

- **sleep**
  - type: int (*)(struct dvb_frontend* fe)
    - callback function used to put the tuner to sleep.

- **write**
  - type: int (*)(struct dvb_frontend* fe,const u8 buf[],int len)
    - callback function used by some demod legacy drivers to allow other drivers to write data into their registers. Should not be used on new drivers.

- **tune**
  - type: int (*)(struct dvb_frontend* fe, bool re_tune, unsigned int mode_flags, unsigned int *delay, enum fe_status *status)
callback function used by demod drivers that use `DVBFE_ALGO_HW` to tune into a frequency.

**get_frontend_algo**

- **type**: `enum dvbfe_algo (*)(struct dvb_frontend *fe)`
- returns the desired hardware algorithm.

**set_frontend**

- **type**: `int (*)(struct dvb_frontend *fe)`
- callback function used to inform the demod to set the parameters for demodulating a digital TV channel. The properties to be used are stored at `dvb_frontend.dtv_property_cache`. The demod can change the parameters to reflect the changes needed for the channel to be decoded, and update statistics.

**get_tune_settings**

- **type**: `int (*)(struct dvb_frontend* fe,struct dvb_frontend_tune_settings* settings)`
- callback function

**get_frontend**

- **type**: `int (*)(struct dvb_frontend *fe,struct dtv_frontend_properties *props)`
- callback function used to inform the parameters actually in use. The properties to be used are stored at `dvb_frontend.dtv_property_cache`; and update statistics. Please notice that it should not return an error code if the statistics are not available because the demod is not locked.

**read_status**

- **type**: `int (*)(struct dvb_frontend *fe,enum fe_status *status)`
- returns the locking status of the frontend.

**read_ber**

- **type**: `int (*)(struct dvb_frontend* fe,u32* ber)`
- legacy callback function to return the bit error rate. Newer drivers should provide such info via DVBv5 API, e.g. `set_frontend`; `get_frontend`; implementing this callback only if DVBv3 API compatibility is wanted.

**read_signal_strength**

- **type**: `int (*)(struct dvb_frontend* fe,u16* strength)`
- legacy callback function to return the signal strength. Newer drivers should provide such info via DVBv5 API, e.g. `set_frontend`; `get_frontend`; implementing this callback only if DVBv3 API compatibility is wanted.

**read_snr**

- **type**: `int (*)(struct dvb_frontend* fe,u16* snr)`
- legacy callback function to return the Signal/Noise rate. Newer drivers should provide such info via DVBv5 API, e.g. `set_frontend`; `get_frontend`; implementing this callback only if DVBv3 API compatibility is wanted.

**read_ucblocks**

- **type**: `int (*)(struct dvb_frontend* fe,u32* ucblocks)`
- legacy callback function to return the Uncorrected Error Blocks. Newer drivers should provide such info via DVBv5 API, e.g. `set_frontend`; `get_frontend`; implementing this callback only if DVBv3 API compatibility is wanted.

**diseqc_reset_overload**

- **type**: `int (*)(struct dvb_frontend* fe)`
callback function to implement the FE_DISEQC_RESET_OVERLOAD ioctl (only Satellite)

diseqc_send_master_cmd

- **type:** int (*)(struct dvb_frontend* fe, struct dvb_diseqc_master_cmd* cmd)

  callback function to implement the FE_DISEQC_SEND_MASTER_CMD ioctl (only Satellite).

diseqc_recv_slave_reply

- **type:** int (*)(struct dvb_frontend* fe, struct dvb_diseqc_slave_reply* reply)

  callback function to implement the FE_DISEQC_RECV_SLAVE_REPLY ioctl (only Satellite)

diseqc_send_burst

- **type:** int (*)(struct dvb_frontend *fe, enum fe_sec_mini_cmd minicmd)

  callback function to implement the FE_DISEQC_SEND_BURST ioctl (only Satellite).

set_tone

- **type:** int (*)(struct dvb_frontend *fe, enum fe_sec_tone_mode tone)

  callback function to implement the FE_SET_TONE ioctl (only Satellite).

set_voltage

- **type:** int (*)(struct dvb_frontend *fe, enum fe_sec_voltage voltage)

  callback function to implement the FE_SET_VOLTAGE ioctl (only Satellite).

enable_high_lnb_voltage

- **type:** int (*)(struct dvb_frontend* fe, long arg)

  callback function to implement the FE_ENABLE_HIGH_LNB_VOLTAGE ioctl (only Satellite).

dishnetwork_send_legacy_command

- **type:** int (*)(struct dvb_frontend* fe, unsigned long cmd)

  callback function to implement the FE_DISHNETWORK_SEND_LEGACY_CMD ioctl (only Satellite).

  Drivers should not use this, except when the DVB core emulation fails to provide proper support (e.g. if `set_voltage` takes more than 8ms to work), and when backward compatibility with this legacy API is required.

i2c_gate_ctrl

- **type:** int (*)(struct dvb_frontend* fe, int enable)

  controls the I2C gate. Newer drivers should use I2C mux support instead.

ts_bus_ctrl

- **type:** int (*)(struct dvb_frontend* fe, int acquire)

  callback function used to take control of the TS bus.

set_lna

- **type:** int (*)(struct dvb_frontend *)

  callback function to power on/off/auto the LNA.

search

- **type:** enum dvbfe_search (*)(struct dvb_frontend *fe)

  callback function used on some custom algo search algos.

tuner_ops

- **type:** pointer to struct dvb_tuner_ops
analog_ops

  • type: struct analog_demod_ops
  
  pointer to struct analog_demod_ops

set_property

  • type: int (*)(struct dvb_frontend* fe, struct dtv_property* tvp)
  
  callback function to allow the frontend to validate incoming properties. Should not be used on new drivers.

get_property

  • type: int (*)(struct dvb_frontend* fe, struct dtv_property* tvp)
  
  callback function to allow the frontend to override outgoing properties. Should not be used on new drivers.

struct dtv_frontend_properties

  contains a list of properties that are specific to a digital TV standard.

Definition

```c
struct dtv_frontend_properties {
  u32 frequency;
  enum fe_modulation modulation;
  enum fe_sec_voltage voltage;

Members

frequency
  • **type:** u32
    frequency in Hz for terrestrial/cable or in kHz for Satellite

modulation
  • **type:** enum fe_modulation
    Frontend modulation type

voltage
  • **type:** enum fe_sec_voltage
    SEC voltage (only Satellite)

sectone
  • **type:** enum fe_sec_tone_mode
    SEC tone mode (only Satellite)

inversion
  • **type:** enum fe_spectral_inversion
    Spectral inversion

cfec_inner
  • **type:** enum fe_code_rate
    Forward error correction inner Code Rate

transmission_mode
  • **type:** enum fe_transmit_mode
    Transmission Mode

bandwidth_hz
  • **type:** u32
    Bandwidth, in Hz. A zero value means that userspace wants to autodetect.

guard_interval
  • **type:** enum fe_guard_interval
    Guard Interval

hierarchy
  • **type:** enum fe_hierarchy
    Hierarchy

symbol_rate
- **type**: u32
  Symbol Rate

**code_rate_HP**
- **type**: enum fe_code_rate
  high priority stream code rate

**code_rate_LP**
- **type**: enum fe_code_rate
  low priority stream code rate

**pilot**
- **type**: enum fe_pilot
  Enable/disable/autodetect pilot tones

**rolloff**
- **type**: enum fe_rolloff
  Rolloff factor (alpha)

**delivery_system**
- **type**: enum fe_delivery_system
  FE delivery system (e.g. digital TV standard)

**interleaving**
- **type**: enum fe_interleaving
  interleaving

**isdbt_partial_reception**
- **type**: u8
  ISDB-T partial reception (only ISDB standard)

**isdbt_sb_mode**
- **type**: u8
  ISDB-T Sound Broadcast (SB) mode (only ISDB standard)

**isdbt_sb_subchannel**
- **type**: u8
  ISDB-T SB subchannel (only ISDB standard)

**isdbt_sb_segment_idx**
- **type**: u32
  ISDB-T SB segment index (only ISDB standard)

**isdbt_sb_segment_count**
- **type**: u32
  ISDB-T SB segment count (only ISDB standard)

**isdbt_layer_enabled**
- **type**: u8
  ISDB Layer enabled (only ISDB standard)

layer[3]
- **type**: struct

  ISDB per-layer data (only ISDB standard) **layer**.segment_count: Segment Count; **layer**.fec: per layer code rate; **layer**.modulation: per layer modulation; **layer**.interleaving: per layer interleaving.

**stream_id**
  - **type**: u32

  If different than zero, enable substream filtering, if hardware supports (DVB-S2 and DVB-T2).

**atscmh_fic_ver**
  - **type**: u8

  Version number of the FIC (Fast Information Channel) signaling data (only ATSC-M/H)

**atscmh_parade_id**
  - **type**: u8

  Parade identification number (only ATSC-M/H)

**atscmh_nog**
  - **type**: u8

  Number of MH groups per MH subframe for a designated parade (only ATSC-M/H)

**atscmh_tnog**
  - **type**: u8

  Total number of MH groups including all MH groups belonging to all MH parades in one MH subframe (only ATSC-M/H)

**atscmh_sgn**
  - **type**: u8

  Start group number (only ATSC-M/H)

**atscmh_prc**
  - **type**: u8

  Parade repetition cycle (only ATSC-M/H)

**atscmh_rs_frame_mode**
  - **type**: u8

  Reed Solomon (RS) frame mode (only ATSC-M/H)

**atscmh_rs_frame_ensemble**
  - **type**: u8

  RS frame ensemble (only ATSC-M/H)

**atscmh_rs_code_mode_pri**
  - **type**: u8

  RS code mode pri (only ATSC-M/H)

**atscmh_rs_code_mode_sec**
  - **type**: u8

  RS code mode sec (only ATSC-M/H)

**atscmh_sccc_block_mode**
  - **type**: u8

  Series Concatenated Convolutional Code (SCCC) Block Mode (only ATSC-M/H)
**atcmh_sccc_code_mode_a**
- **type**: u8
  - SCCC code mode A (only ATSC-M/H)

**atcmh_sccc_code_mode_b**
- **type**: u8
  - SCCC code mode B (only ATSC-M/H)

**atcmh_sccc_code_mode_c**
- **type**: u8
  - SCCC code mode C (only ATSC-M/H)

**atcmh_sccc_code_mode_d**
- **type**: u8
  - SCCC code mode D (only ATSC-M/H)

**lna**
- **type**: u32
  - Power ON/OFF/AUTO the Linear Now-noise Amplifier (LNA)

**strength**
- **type**: struct dtv_fe_stats
  - DVBv5 API statistics: Signal Strength

**cnr**
- **type**: struct dtv_fe_stats
  - DVBv5 API statistics: Signal to Noise ratio of the (main) carrier

**pre_bit_error**
- **type**: struct dtv_fe_stats
  - DVBv5 API statistics: pre-Viterbi bit error count

**pre_bit_count**
- **type**: struct dtv_fe_stats
  - DVBv5 API statistics: pre-Viterbi bit count

**post_bit_error**
- **type**: struct dtv_fe_stats
  - DVBv5 API statistics: post-Viterbi bit error count

**post_bit_count**
- **type**: struct dtv_fe_stats
  - DVBv5 API statistics: post-Viterbi bit count

**block_error**
- **type**: struct dtv_fe_stats
  - DVBv5 API statistics: block error count

**block_count**
- **type**: struct dtv_fe_stats
  - DVBv5 API statistics: block count
NOTE

derivated statistics like Uncorrected Error blocks (UCE) are calculated on userspace.

Only a subset of the properties are needed for a given delivery system. For more info, consult the media_api.html with the documentation of the Userspace API.

```c
struct dvb_frontend
    Frontend structure to be used on drivers.

Definition

struct dvb_frontend {
    struct dvb_frontend_ops ops;
    struct dvb_adapter * dvb;
    void * demodulator_priv;
    void * tuner_priv;
    void * frontend_priv;
    void * sec_priv;
    void * analog_demod_priv;
    struct dtv_frontend_properties dtv_property_cache;
#define DVB_FRONTEND_COMPONENT_TUNER 0
#define DVB_FRONTEND_COMPONENT_DEMOD 1
    int (* callback) (void *adapter_priv, int component, int cmd, int arg);
    int id;
    unsigned int exit;
};
```

Members

ops

- **type**: struct dvb_frontend_ops
  embedded struct dvb_frontend_ops

dvb

- **type**: struct dvb_adapter *
  pointer to struct dvb_adapter
demodulator_priv

- **type**: void *
  demod private data
tuner_priv

- **type**: void *
  tuner private data
frontend_priv

- **type**: void *
  frontend private data
sec_priv

- **type**: void *
  SEC private data
analog_demod_priv

- **type**: void *
  Analog demod private data
dtv_property_cache
• **type**: struct dtv_frontend_properties
  embedded struct dtv_frontend_properties

**callback**

• **type**: int (*)(void *adapter_priv,int component,int cmd,int arg)
  callback function used on some drivers to call either the tuner or the demodulator.

**id**

• **type**: int
  Frontend ID

**exit**

• **type**: unsigned int
  Used to inform the DVB core that the frontend thread should exit (usually, means that the hardware got disconnected.

```c
int dvb_register_frontend(struct dvb_adapter * dvb, struct dvb_frontend * fe)
```
Registers a DVB frontend at the adapter

**Parameters**

- **struct dvb_adapter * dvb** pointer to the dvb adapter
- **struct dvb_frontend * fe** pointer to the frontend struct

**Description**

Allocate and initialize the private data needed by the frontend core to manage the frontend and calls dvb_register_device() to register a new frontend. It also cleans the property cache that stores the frontend parameters and selects the first available delivery system.

```c
int dvb_unregister_frontend(struct dvb_frontend * fe)
```
Unregisters a DVB frontend

**Parameters**

- **struct dvb_frontend * fe** pointer to the frontend struct

**Description**

Stops the frontend kthread, calls dvb_unregister_device() and frees the private frontend data allocated by dvb_register_frontend().

**NOTE**

This function doesn’t frees the memory allocated by the demod, by the SEC driver and by the tuner. In order to free it, an explicit call to dvb_frontend_detach() is needed, after calling this function.

```c
void dvb_frontend_detach(struct dvb_frontend * fe)
```
Detaches and frees frontend specific data

**Parameters**

- **struct dvb_frontend * fe** pointer to the frontend struct

**Description**

This function should be called after dvb_unregister_frontend(). It calls the SEC, tuner and demod release functions: dvb_frontend_ops.release_sec, dvb_frontend_ops.tuner_ops.release, dvb_frontend_ops.analog_ops.release and dvb_frontend_ops.release.

If the driver is compiled with CONFIG_MEDIA_ATTACH, it also decreases the module reference count, needed to allow userspace to remove the previously used DVB frontend modules.

```c
int dvb_frontend_suspend(struct dvb_frontend * fe)
```
Suspends a Digital TV frontend
Parameters
struct dvb_frontend * fe pointer to the frontend struct

Description
This function prepares a Digital TV frontend to suspend.
In order to prepare the tuner to suspend, if \texttt{dvb_frontend_ops.tuner_ops.suspend()} is available, it calls it. Otherwise, it will call \texttt{dvb_frontend_ops.tuner_ops.sleep()}, if available.
It will also call \texttt{dvb_frontend_ops.sleep()} to put the demod to suspend.
The drivers should also call \texttt{dvb_frontend_suspend()} as part of their handler for the device_driver.suspend().

\textbf{int dvb_frontend_resume(struct dvb_frontend * fe)}
Resumes a Digital TV frontend

Parameters
struct dvb_frontend * fe pointer to the frontend struct

Description
This function resumes the usual operation of the tuner after resume.
In order to resume the frontend, it calls the demod \texttt{dvb_frontend_ops.init()}. If \texttt{dvb_frontend_ops.tuner_ops.resume()} is available, it calls it. Otherwise, it will call \texttt{dvb_frontend_ops.tuner_ops.init()}, if available.
Once tuner and demods are resumed, it will enforce that the SEC voltage and tone are restored to their previous values and wake up the frontend’s kthread in order to retune the frontend.
The drivers should also call \texttt{dvb_frontend_resume()} as part of their handler for the device_driver.resume().

\textbf{void dvb_frontend_reinitialise(struct dvb_frontend * fe)}
forces a reinitialisation at the frontend

Parameters
struct dvb_frontend * fe pointer to the frontend struct

Description
Calls \texttt{dvb_frontend_ops.init()} and \texttt{dvb_frontend_ops.tuner_ops.init()}, and resets SEC tone and voltage (for Satellite systems).

\textbf{NOTE}
Currently, this function is used only by one driver (budget-av). It seems to be due to address some special issue with that specific frontend.

\textbf{void dvb_frontend_sleep_until(ktime_t * waketime, u32 add_usec)}
Sleep for the amount of time given by add_usec parameter

Parameters
ktime_t * waketime pointer to a struct ktime_t
u32 add_usec time to sleep, in microseconds

Description
This function is used to measure the time required for the \texttt{FE\_DISHNETWORK\_SEND\_LEGACY\_CMD} ioctl to work. It needs to be as precise as possible, as it affects the detection of the dish tone command at the satellite subsystem.
It's used internally by the DVB frontend core, in order to emulate \texttt{FE\_DISHNETWORK\_SEND\_LEGACY\_CMD} using the \texttt{dvb_frontend_ops.set_voltage()} callback.
NOTE

It should not be used at the drivers, as the emulation for the legacy callback is provided by the Kernel. The only situation where this should be at the drivers is when there are some bugs at the hardware that would prevent the core emulation to work. On such cases, the driver would be writing a `dvbfrontend_ops.dishnetwork_send_legacy_command` and calling this function directly.

2.5 Digital TV Demux kABI

2.5.1 Digital TV Demux

The Kernel Digital TV Demux kABI defines a driver-internal interface for registering low-level, hardware specific driver to a hardware independent demux layer. It is only of interest for Digital TV device driver writers. The header file for this kABI is named demux.h and located in drivers/media/dvb-core.

The demux kABI should be implemented for each demux in the system. It is used to select the TS source of a demux and to manage the demux resources. When the demux client allocates a resource via the demux kABI, it receives a pointer to the kABI of that resource.

Each demux receives its TS input from a DVB front-end or from memory, as set via this demux kABI. In a system with more than one front-end, the kABI can be used to select one of the DVB front-ends as a TS source for a demux, unless this is fixed in the HW platform.

The demux kABI only controls front-ends regarding to their connections with demuxes; the kABI used to set the other front-end parameters, such as tuning, are devined via the Digital TV Frontend kABI.

The functions that implement the abstract interface demux should be defined static or module private and registered to the Demux core for external access. It is not necessary to implement every function in the struct &dmx_demux. For example, a demux interface might support Section filtering, but not PES filtering. The kABI client is expected to check the value of any function pointer before calling the function: the value of NULL means that the function is not available.

Whenever the functions of the demux API modify shared data, the possibilities of lost update and race condition problems should be addressed, e.g. by protecting parts of code with mutexes.

Note that functions called from a bottom half context must not sleep. Even a simple memory allocation without using GFP_ATOMIC can result in a kernel thread being put to sleep if swapping is needed. For example, the Linux Kernel calls the functions of a network device interface from a bottom half context. Thus, if a demux kABI function is called from network device code, the function must not sleep.

2.6 Demux Callback API

2.6.1 Demux Callback

This kernel-space API comprises the callback functions that deliver filtered data to the demux client. Unlike the other DVB kABIs, these functions are provided by the client and called from the demux code.

The function pointers of this abstract interface are not packed into a structure as in the other demux APIs, because the callback functions are registered and used independent of each other. As an example, it is possible for the API client to provide several callback functions for receiving TS packets and no callbacks for PES packets or sections.

The functions that implement the callback API need not be re-entrant: when a demux driver calls one of these functions, the driver is not allowed to call the function again before the original call returns. If a callback is triggered by a hardware interrupt, it is recommended to use the Linux bottom half mechanism or start a tasklet instead of making the callback function call directly from a hardware interrupt.

This mechanism is implemented by `dmx_ts_cb()` and `dmx_section_cb()` callbacks.
enum ts_filter_type
    filter type bitmap for dmx_ts_feed.set()

Constants
TS_PACKET  Send TS packets (188 bytes) to callback (default).
TS_PAYLOAD_ONLY  In case TS_PACKET is set, only send the TS payload (<=184 bytes per packet) to call-
                 back
TS_DECODER  Send stream to built-in decoder (if present).
TS_DEMUX   In case TS_PACKET is set, send the TS to the demux device, not to the dvr device

struct dmx_ts_feed
    Structure that contains a TS feed filter

Definition

struct dmx_ts_feed {
    int is_filtering;
    struct dmx_demux * parent;
    void * priv;
    int (* set) (struct dmx_ts_feed *feed,u16 pid,int type,enum dmx_ts_pes pes_type,size_t circular_buffer_size,ktime_t timeout);
    int (* start_filtering) (struct dmx_ts_feed *feed);
    int (* stop_filtering) (struct dmx_ts_feed *feed);
};

Members

is_filtering
    • type: int
        Set to non-zero when filtering in progress

parent
    • type: struct dmx_demux *
        pointer to struct dmx_demux

priv
    • type: void *
        pointer to private data of the API client

set
    • type: int (*)(struct dmx_ts_feed *feed,u16 pid,int type,enum dmx_ts_pes pes_type,size_t circular_buffer_size,ktime_t timeout)
        sets the TS filter

start_filtering
    • type: int (*)(struct dmx_ts_feed *feed)
        starts TS filtering

stop_filtering
    • type: int (*)(struct dmx_ts_feed *feed)
        stops TS filtering

Description

A TS feed is typically mapped to a hardware PID filter on the demux chip. Using this API, the client can set the filtering properties to start/stop filtering TS packets on a particular TS feed.

2.6. Demux Callback API 755
struct dmx_section_filter
    Structure that describes a section filter

Definition

struct dmx_section_filter {
    u8 filter_value[DMX_MAX_FILTER_SIZE];
    u8 filter_mask[DMX_MAX_FILTER_SIZE];
    u8 filter_mode[DMX_MAX_FILTER_SIZE];
    struct dmx_section_feed * parent;
    void * priv;
};

Members

filter_value[DMX_MAX_FILTER_SIZE]
    • type: u8
    Contains up to 16 bytes (128 bits) of the TS section header that will be matched by the section filter

filter_mask[DMX_MAX_FILTER_SIZE]
    • type: u8
    Contains a 16 bytes (128 bits) filter mask with the bits specified by filter_value that will be used on the filter match logic.

filter_mode[DMX_MAX_FILTER_SIZE]
    • type: u8
    Contains a 16 bytes (128 bits) filter mode.

parent
    • type: struct dmx_section_feed *
    Pointer to struct dmx_section_feed.

priv
    • type: void *
    Pointer to private data of the API client.

Description

The filter_mask controls which bits of filter_value are compared with the section headers/payload. On a binary value of 1 in filter_mask, the corresponding bits are compared. The filter only accepts sections that are equal to filter_value in all the tested bit positions.

struct dmx_section_feed
    Structure that contains a section feed filter

Definition

struct dmx_section_feed {
    int is_filtering;
    struct dmx_demux * parent;
    void * priv;
    int check_crc;
    int (* set) (struct dmx_section_feed *feed,u16 pid,size_t circular_buffer_size,int check_crc);
    int (* allocate_filter) (struct dmx_section_feed *feed,struct dmx_section_filter **filter);
    int (* release_filter) (struct dmx_section_feed *feed,struct dmx_section_filter *filter);
    int (* start_filtering) (struct dmx_section_feed *feed);
    int (* stop_filtering) (struct dmx_section_feed *feed);
};

Members
is_filtering
  • type: int
    Set to non-zero when filtering in progress

parent
  • type: struct dmx_demux *
    pointer to struct dmx_demux

priv
  • type: void *
    pointer to private data of the API client

check_crc
  • type: int
    If non-zero, check the CRC values of filtered sections.

set
  • type: int (*)(struct dmx_section_feed *feed,u16 pid,size_t circular_buffer_size,int check_crc)
    sets the section filter

allocate_filter
  • type: int (*)(struct dmx_section_feed *feed,struct dmx_section_filter **filter)
    This function is used to allocate a section filter on the demux. It should only be called when no
    filtering is in progress on this section feed. If a filter cannot be allocated, the function fails with
    -ENOSPC.

release_filter
  • type: int (*)(struct dmx_section_feed *feed,struct dmx_section_filter *filter)
    This function releases all the resources of a previously allocated section filter. The function should
    not be called while filtering is in progress on this section feed. After calling this function, the caller
    should not try to dereference the filter pointer.

start_filtering
  • type: int (*)(struct dmx_section_feed *feed)
    starts section filtering

stop_filtering
  • type: int (*)(struct dmx_section_feed *feed)
    stops section filtering

Description
A TS feed is typically mapped to a hardware PID filter on the demux chip. Using this API, the client can
set the filtering properties to start/stop filtering TS packets on a particular TS feed.

int dmx_ts_cb(const u8 * buffer1, size_t buffer1_length, const u8 * buffer2, size_t buffer2_length, struct dmx_ts_feed * source)
DVB demux TS filter callback function prototype

Parameters
const u8 * buffer1 Pointer to the start of the filtered TS packets.
size_t buffer1_length Length of the TS data in buffer1.
const u8 * buffer2 Pointer to the tail of the filtered TS packets, or NULL.
size_t buffer2_length Length of the TS data in buffer2.
struct dmx_ts_feed * source Indicates which TS feed is the source of the callback.

Description
This function callback prototype, provided by the client of the demux API, is called from the demux code. The function is only called when filtering on a TS feed has been enabled using the `start_filtering()` function at the `dmx_demux`. Any TS packets that match the filter settings are copied to a circular buffer. The filtered TS packets are delivered to the client using this callback function. The size of the circular buffer is controlled by the `circular_buffer_size` parameter of the `dmx_ts_feed` function. It is expected that the `buffer1` and `buffer2` callback parameters point to addresses within the circular buffer, but other implementations are also possible. Note that the called party should not try to free the memory the `buffer1` and `buffer2` parameters point to.

When this function is called, the `buffer1` parameter typically points to the start of the first undelivered TS packet within a circular buffer. The `buffer2` buffer parameter is normally NULL, except when the received TS packets have crossed the last address of the circular buffer and “wrapped” to the beginning of the buffer. In the latter case the `buffer1` parameter would contain an address within the circular buffer, while the `buffer2` parameter would contain the first address of the circular buffer. The number of bytes delivered with this function (i.e. `buffer1_length + buffer2_length`) is usually equal to the value of the `callback_length` parameter given in the `set()` function, with one exception: if a timeout occurs before receiving `callback_length` bytes of TS data, any undelivered packets are immediately delivered to the client by calling this function. The timeout duration is controlled by the `set()` function in the TS Feed API.

If a TS packet is received with errors that could not be fixed by the TS-level forward error correction (FEC), the Transport_error_indicator flag of the TS packet header should be set. The TS packet should not be discarded, as the error can possibly be corrected by a higher layer protocol. If the called party is slow in processing the callback, it is possible that the circular buffer eventually fills up. If this happens, the demux driver should discard any TS packets received while the buffer is full and return -EOVERFLOW.

The type of data returned to the callback can be selected by the `dmx_ts_feed.set` function. The type parameter decides if the raw TS packet (TS_PACKET) or just the payload (TS_PACKET|TS_PAYLOAD_ONLY) should be returned. If additionally the TS_DECODER bit is set the stream will also be sent to the hardware MPEG decoder.

Return
0, on success; -EOVERFLOW, on buffer overflow.

```c
int dmx_section_cb(const u8 * buffer1, size_t buffer1_len, const u8 * buffer2, size_t buffer2_len, struct dmx_section_filter * source)
```

Parameters
- `buffer1` Pointer to the start of the filtered section, e.g. within the circular buffer of the demux driver.
- `buffer1_len` Length of the filtered section data in `buffer1`, including headers and CRC.
- `buffer2` Pointer to the tail of the filtered section data, or NULL. Useful to handle the wrapping of a circular buffer.
- `buffer2_len` Length of the filtered section data in `buffer2`, including headers and CRC.
- `source` Indicates which section feed is the source of the callback.

Description
This function callback prototype, provided by the client of the demux API, is called from the demux code. The function is only called when filtering of sections has been enabled using the function `dmx_ts_feed.start_filtering()`. When the demux driver has received a complete section that matches at least one section filter, the client is notified via this callback function. Normally this function is called for each received section; however, it is also possible to deliver multiple sections with one callback, for example when the system load is high. If an error occurs while receiving a section, this function should be called with the corresponding error type set in the success field, whether or not there is data to deliver.
The Section Feed implementation should maintain a circular buffer for received sections. However, this is not necessary if the Section Feed API is implemented as a client of the TS Feed API, because the TS Feed implementation then buffers the received data. The size of the circular buffer can be configured using the `dmx_ts_feed`.**set** function in the Section Feed API. If there is no room in the circular buffer when a new section is received, the section must be discarded. If this happens, the value of the success parameter should be `DMX_OVERRUN_ERROR` on the next callback.

```c
enum dmx_frontend_source
  Used to identify the type of frontend

Constants

DMX_MEMORY_FE  The source of the demux is memory. It means that the MPEG-TS to be filtered comes from userspace, via `write()` syscall.

DMX_FRONTEND_0  The source of the demux is a frontend connected to the demux.
```

```c
struct dmx_frontend
  Structure that lists the frontends associated with a demux

Definition
```

```c
struct dmx_frontend {
  struct list_head connectivity_list;
  enum dmx_frontend_source source;
};
```

```c
Members

connectivity_list
  • type: struct list_head
    List of front-ends that can be connected to a particular demux;

source
  • type: enum dmx_frontend_source
    Type of the frontend.

Description

FIXME: this structure should likely be replaced soon by some media-controller based logic.
```

```c
enum dmx_demux_caps
  MPEG-2 TS Demux capabilities bitmap

Constants

DMX_TS_FILTERING  set if TS filtering is supported;

DMX_SECTION_FILTERING  set if section filtering is supported;

DMX_MEMORY_BASED_FILTERING  set if `write()` available.
```

```c
Description

Those flags are OR’ed in the `dmx_demux.capabilities` field

struct dmx_demux
  Structure that contains the demux capabilities and callbacks.

Definition
```

```c
struct dmx_demux {
  enum dmx_demux_caps capabilities;
  struct dmx_frontend * frontend;
  void * priv;
  int (* open) (struct dmx_demux *demux);
  int (* close) (struct dmx_demux *demux);
};
```
Members

capabilities

- **type**: enum dmx_demux_caps
  Bitfield of capability flags.

frontend

- **type**: struct dmx_frontend *
  Front-end connected to the demux

priv

- **type**: void *
  Pointer to private data of the API client

open

- **type**: int (*)(struct dmx_demux *demux)
  This function reserves the demux for use by the caller and, if necessary, initializes the demux. When the demux is no longer needed, the function close should be called. It should be possible for multiple clients to access the demux at the same time. Thus, the function implementation should increment the demux usage count when open is called and decrement it when close is called. The demux function parameter contains a pointer to the demux API and instance data. It returns: 0 on success; -EUSERS, if maximum usage count was reached; -EINVAL, on bad parameter.

close

- **type**: int (*)(struct dmx_demux *demux)
  This function reserves the demux for use by the caller and, if necessary, initializes the demux. When the demux is no longer needed, the function close should be called. It should be possible for multiple clients to access the demux at the same time. Thus, the function implementation should increment the demux usage count when open is called and decrement it when close is called. The demux function parameter contains a pointer to the demux API and instance data. It returns: 0 on success; -ENODEV, if demux was not in use (e.g. no users); -EINVAL, on bad parameter.

write

- **type**: int (*)(struct dmx_demux *demux, const char __user *buf, size_t count)
  This function provides the demux driver with a memory buffer containing TS packets. Instead of receiving TS packets from the DVB front-end, the demux driver software will read packets from memory. Any clients of this demux with active TS, PES or Section filters will receive filtered data via the Demux callback API (see 0). The function returns when all the data in the buffer has been consumed by the demux. Demux hardware typically cannot read TS from memory. If this is the case, memory-based filtering has to be implemented entirely in software. The demux function parameter contains a pointer to the demux API and instance data. The buf function parameter contains a pointer to the
TS data in kernel-space memory. The `count` function parameter contains the length of the TS data. It returns: 0 on success; -ERESTARTSYS, if mutex lock was interrupted; -EINTR, if a signal handling is pending; -ENODEV, if demux was removed; -EINVAL, on bad parameter.

**allocate_ts_feed**

- **type**: `int (*)(struct dmx_demux *demux,struct dmx_ts_feed **feed, dmx_ts_cb callback)`

Allocates a new TS feed, which is used to filter the TS packets carrying a certain PID. The TS feed normally corresponds to a hardware PID filter on the demux chip. The `demux` function parameter contains a pointer to the demux API and instance data. The `feed` function parameter contains a pointer to the TS feed API and instance data. The `callback` function parameter contains a pointer to the callback function for passing received TS packet. It returns: 0 on success; -ERESTARTSYS, if mutex lock was interrupted; -EBUSY, if no more TS feeds is available; -EINVAL, on bad parameter.

**release_ts_feed**

- **type**: `int (*)(struct dmx_demux *demux, struct dmx_ts_feed *feed)`

Releases the resources allocated with `allocate_ts_feed`. Any filtering in progress on the TS feed should be stopped before calling this function. The `demux` function parameter contains a pointer to the demux API and instance data. The `feed` function parameter contains a pointer to the TS feed API and instance data. It returns: 0 on success; -EINVAL on bad parameter.

**allocate_section_feed**

- **type**: `int (*)(struct dmx_demux *demux,struct dmx_section_feed **feed, dmx_section_cb callback)`

Allocates a new section feed, i.e. a demux resource for filtering and receiving sections. On platforms with hardware support for section filtering, a section feed is directly mapped to the demux HW. On other platforms, TS packets are first PID filtered in hardware and a hardware section filter then emulated in software. The caller obtains an API pointer of type `dmx_section_feed_t` as an out parameter. Using this API the caller can set filtering parameters and start receiving sections. The `demux` function parameter contains a pointer to the demux API and instance data. The `feed` function parameter contains a pointer to the TS feed API and instance data. The `callback` function parameter contains a pointer to the callback function for passing received TS packet. It returns: 0 on success; -EBUSY, if no more TS feeds is available; -EINVAL, on bad parameter.

**release_section_feed**

- **type**: `int (*)(struct dmx_demux *demux, struct dmx_section_feed *feed)`

Releases the resources allocated with `allocate_section_feed`, including allocated filters. Any filtering in progress on the section feed should be stopped before calling this function. The `demux` function parameter contains a pointer to the demux API and instance data. The `feed` function parameter contains a pointer to the TS feed API and instance data. It returns: 0 on success; -EINVAL on bad parameter.

**add_frontend**

- **type**: `int (*)(struct dmx_demux *demux, struct dmx_frontend *frontend)`

Registers a connectivity between a demux and a front-end, i.e., indicates that the demux can be connected via a call to `connect_frontend` to use the given front-end as a TS source. The client of this function has to allocate dynamic or static memory for the frontend structure and initialize its fields before calling this function. This function is normally called during the driver initialization. The caller must not free the memory of the frontend struct before successfully calling `remove_frontend`. The `demux` function parameter contains a pointer to the demux API and instance data. The `frontend` function parameter contains a pointer to the front-end instance data. It returns: 0 on success; -EINVAL, on bad parameter.

**remove_frontend**

- **type**: `int (*)(struct dmx_demux *demux, struct dmx_frontend *frontend)`
Indicates that the given front-end, registered by a call to `add_frontend`, can no longer be connected as a TS source by this demux. The function should be called when a front-end driver or a demux driver is removed from the system. If the front-end is in use, the function fails with the return value of -EBUSY. After successfully calling this function, the caller can free the memory of the frontend struct if it was dynamically allocated before the `add_frontend` operation. The `demux` function parameter contains a pointer to the demux API and instance data. The `frontend` function parameter contains a pointer to the front-end instance data. It returns: 0 on success; -ENODEV, if the front-end was not found, -EINVAL, on bad parameter.

**get_frontends**

- **type**: `struct list_head *(*)(struct dmx_demux *demux)`

Provides the APIs of the front-ends that have been registered for this demux. Any of the front-ends obtained with this call can be used as a parameter for `connect_frontend`. The include file demux.h contains the macro DMX_FE_ENTRY() for converting an element of the generic type `struct list_head` to the type `struct dmx_frontend`. The caller must not free the memory of any of the elements obtained via this function call. The `**demux` function parameter contains a pointer to the demux API and instance data. It returns a struct list_head pointer to the list of front-end interfaces, or NULL in the case of an empty list.

**connect_frontend**

- **type**: `int (*)(struct dmx_demux *demux,struct dmx_frontend *frontend)`

Connects the TS output of the front-end to the input of the demux. A demux can only be connected to a front-end registered to the demux with the function `add_frontend`. It may or may not be possible to connect multiple demuxes to the same front-end, depending on the capabilities of the HW platform. When not used, the front-end should be released by calling `disconnect_frontend`. The `demux` function parameter contains a pointer to the demux API and instance data. The `frontend` function parameter contains a pointer to the front-end instance data. It returns: 0 on success; -EINVAL, on bad parameter.

**disconnect_frontend**

- **type**: `int (*)(struct dmx_demux *demux)`

Disconnects the demux and a front-end previously connected by a `connect_frontend` call. The `demux` function parameter contains a pointer to the demux API and instance data. It returns: 0 on success; -EINVAL, on bad parameter.

**get_pes_pids**

- **type**: `int (*)(struct dmx_demux *demux,u16 *pids)`

Get the PIDs for DMX_PES_AUDIO0, DMX_PES_VIDEO0, DMX_PES_TELETEXT0, DMX_PES_SUBTITLE0 and DMX_PES_PCR0. The `demux` function parameter contains a pointer to the demux API and instance data. The `pids` function parameter contains an array with five u16 elements where the PIDs will be stored. It returns: 0 on success; -EINVAL, on bad parameter.

### 2.7 Digital TV Conditional Access kABI

**struct dvb_ca_en50221**

Structure describing a CA interface

**Definition**

```c
struct dvb_ca_en50221 {
    struct module * owner;
    int (* read_attribute_mem) (struct dvb_ca_en50221 *ca, int slot, int address);
    int (* write_attribute_mem) (struct dvb_ca_en50221 *ca, int slot, int address, u8 value);
    int (* read_cam_control) (struct dvb_ca_en50221 *ca, int slot, u8 address);
    int (* write_cam_control) (struct dvb_ca_en50221 *ca, int slot, u8 address, u8 value);
};
```
int (* slot_reset) (struct dvb_ca_en50221 *ca, int slot);
int (* slot_shutdown) (struct dvb_ca_en50221 *ca, int slot);
int (* slot_ts_enable) (struct dvb_ca_en50221 *ca, int slot);
int (* poll_slot_status) (struct dvb_ca_en50221 *ca, int slot, int open);
void * data;
void * private;
};

Members
owner
  • type: struct module *
    the module owning this structure
read_attribute_mem
  • type: int (*)(struct dvb_ca_en50221 *ca,int slot,int address)
    function for reading attribute memory on the CAM
write_attribute_mem
  • type: int (*)(struct dvb_ca_en50221 *ca,int slot,int address,u8 value)
    function for writing attribute memory on the CAM
read_cam_control
  • type: int (*)(struct dvb_ca_en50221 *ca,int slot,u8 address)
    function for reading the control interface on the CAM
write_cam_control
  • type: int (*)(struct dvb_ca_en50221 *ca,int slot,u8 address,u8 value)
    function for reading the control interface on the CAM
slot_reset
  • type: int (*)(struct dvb_ca_en50221 *ca,int slot)
    function to reset the CAM slot
slot_shutdown
  • type: int (*)(struct dvb_ca_en50221 *ca,int slot)
    function to shutdown a CAM slot
slot_ts_enable
  • type: int (*)(struct dvb_ca_en50221 *ca,int slot)
    function to enable the Transport Stream on a CAM slot
poll_slot_status
  • type: int (*)(struct dvb_ca_en50221 *ca,int slot, int open)
    function to poll slot status. Only necessary if DVB_CA_FLAG_EN50221_IRQ_CAMCHANGE is not set.
data
  • type: void *
    private data, used by caller.
private
  • type: void *
    Opaque data used by the dvb_ca core. Do not modify!
NOTE

the read_*, write_* and poll_slot_status functions will be called for different slots concurrently and need
to use locks where and if appropriate. There will be no concurrent access to one slot.

```c
void dvb_ca_en50221_camchange_irq(struct dvb_ca_en50221 * pubca, int slot, int change_type)
A CAMCHANGE IRQ has occurred.
```

**Parameters**

- `struct dvb_ca_en50221 * pubca`: CA instance.
- `int slot`: Slot concerned.
- `int change_type`: One of the DVB_CA_CAMCHANGE_* values

```c
void dvb_ca_en50221_camready_irq(struct dvb_ca_en50221 * pubca, int slot)
A CAMREADY IRQ has occurred.
```

**Parameters**

- `struct dvb_ca_en50221 * pubca`: CA instance.
- `int slot`: Slot concerned.

```c
void dvb_ca_en50221_frda_irq(struct dvb_ca_en50221 * ca, int slot)
An FR or a DA IRQ has occurred.
```

**Parameters**

- `struct dvb_ca_en50221 * ca`: CA instance.
- `int slot`: Slot concerned.
- `int dvb_ca_en50221_init(struct dvb_adapter * dvb_adapter, struct dvb_ca_en50221 * ca, int flags, int slot_count)`
  - Initialise a new DVB CA device.

**Parameters**

- `struct dvb_adapter * dvb_adapter`: DVB adapter to attach the new CA device to.
- `struct dvb_ca_en50221 * ca`: The dvb_ca instance.
- `int flags`: Flags describing the CA device (DVB_CA_EN50221_FLAG_*).
- `int slot_count`: Number of slots supported.

**Description**

```c
return 0 on success, nonzero on failure
```

```c
void dvb_ca_en50221_release(struct dvb_ca_en50221 * ca)
Release a DVB CA device.
```

**Parameters**

- `struct dvb_ca_en50221 * ca`: The associated dvb_ca instance.

### 2.8 Remote Controller devices

#### 2.8.1 Remote Controller core

```c
enum rc_driver_type
    type of the RC output
```

**Constants**

- `RC_DRIVER_SCANCODE`: Driver or hardware generates a scancode

---

764 Chapter 2. Media subsystem kernel internal API
**RC_DRIVER_IR_RAW** Driver or hardware generates pulse/space sequences. It needs a Infra-Red pulse/Space decoder

**struct rc_scancode_filter**
Filter scan codes.

**Definition**

```c
struct rc_scancode_filter {
    u32 data;
    u32 mask;
};
```

**Members**

**data**

- **type:** u32
  Scancode data to match.

**mask**

- **type:** u32
  Mask of bits of scan code to compare.

**enum rc_filter_type**
Filter type constants.

**Constants**

**RC_FILTER_NORMAL** Filter for normal operation.

**RC_FILTER_WAKEUP** Filter for waking from suspend.

**RC_FILTER_MAX** Number of filter types.

**struct rc_dev**
represents a remote control device

**Definition**

```c
struct rc_dev {
    struct device dev;
    atomic_t initialized;
    const struct attribute_group * sysfs_groups[5];
    const char * input_name;
    const char * input_phys;
    struct input_id input_id;
    char * driver_name;
    const char * map_name;
    struct rc_map rc_map;
    struct mutex lock;
    unsigned int minor;
    struct ir_raw_event_ctrl * raw;
    struct input_dev * input_dev;
    enum rc_driver_type driver_type;
    bool idle;
    u64 allowed_protocols;
    u64 enabled_protocols;
    u64 allowed_wakeup_protocols;
    u64 enabled_wakeup_protocols;
    struct rc_scancode_filter scancode_filter;
    struct rc_scancode_filter scancode_wakeup_filter;
    u32 scancode_mask;
    u32 users;
    void * priv;
};
```
spinlock_t keylock;
bool keypressed;
unsigned long keyup_jiffies;
struct timer_list timer_keyup;
u32 last_keycode;
enum rc_type last_protocol;
u32 last_scancode;
u8 last_toggle;
u32 timeout;
u32 min_timeout;
u32 max_timeout;
u32 rx_resolution;
u32 tx_resolution;
int (* change_protocol) (struct rc_dev *dev, u64 *rc_type);
int (* change_wakeup_protocol) (struct rc_dev *dev, u64 *rc_type);
int (* open) (struct rc_dev *dev);
void (* close) (struct rc_dev *dev);
int (* s_tx_mask) (struct rc_dev *dev, u32 mask);
int (* s_tx_carrier) (struct rc_dev *dev, u32 carrier);
int (* s_tx_duty_cycle) (struct rc_dev *dev, u32 duty_cycle);
int (* s_rx_carrier_range) (struct rc_dev *dev, u32 min, u32 max);
int (* tx_ir) (struct rc_dev *dev, unsigned *txbuf, unsigned n);
void (* s_idle) (struct rc_dev *dev, bool enable);
int (* s_learning_mode) (struct rc_dev *dev, int enable);
int (* s_carrier_report) (struct rc_dev *dev, int enable);
int (* s_filter) (struct rc_dev *dev, struct rc_scancode_filter *filter);
int (* s_wakeup_filter) (struct rc_dev *dev,struct rc_scancode_filter *filter);
int (* s_timeout) (struct rc_dev *dev,unsigned int timeout);
};

Members
dev
  • type: struct device
    driver model's view of this device
initialized
  • type: atomic_t
    1 if the device init has completed, 0 otherwise
sysfs_groups[5]
  • type: const struct attribute_group *
    sysfs attribute groups
input_name
  • type: const char *
    name of the input child device
input_phys
  • type: const char *
    physical path to the input child device
input_id
  • type: struct input_id
    id of the input child device (struct input_id)
driver_name
- **type**: char *
  name of the hardware driver which registered this device

**map_name**
- **type**: const char *
  name of the default keymap

**rc_map**
- **type**: struct rc_map
  current scan/key table

**lock**
- **type**: struct mutex
  used to ensure we've filled in all protocol details before anyone can call show_protocols or store_protocols

**minor**
- **type**: unsigned int
  unique minor remote control device number

**raw**
- **type**: struct ir_raw_event_ctrl *
  additional data for raw pulse/space devices

**input_dev**
- **type**: struct input_dev *
  the input child device used to communicate events to userspace

**driver_type**
- **type**: enum rc_driver_type
  specifies if protocol decoding is done in hardware or software

**idle**
- **type**: bool
  used to keep track of RX state

**allowed_protocols**
- **type**: u64
  bitmask with the supported RC_BIT_* protocols

**enabled_protocols**
- **type**: u64
  bitmask with the enabled RC_BIT_* protocols

**allowed_wakeup_protocols**
- **type**: u64
  bitmask with the supported RC_BIT_* wakeup protocols

**enabled_wakeup_protocols**
- **type**: u64
  bitmask with the enabled RC_BIT_* wakeup protocols

---

### 2.8. Remote Controller devices

767
scancode_filter
  • type: struct rc_scancode_filter
    scancode filter

scancode_wakeup_filter
  • type: struct rc_scancode_filter
    scancode wakeup filters

scancode_mask
  • type: u32
    some hardware decoders are not capable of providing the full scancode to the application. As this is a hardware limit, we can't do anything with it. Yet, as the same keycode table can be used with other devices, a mask is provided to allow its usage. Drivers should generally leave this field in blank

users
  • type: u32
    number of current users of the device

priv
  • type: void *
    driver-specific data

keylock
  • type: spinlock_t
    protects the remaining members of the struct

keypressed
  • type: bool
    whether a key is currently pressed

keyup_jiffies
  • type: unsigned long
    time (in jiffies) when the current keypress should be released

timer_keyup
  • type: struct timer_list
    timer for releasing a keypress

last_keycode
  • type: u32
    keycode of last keypress

last_protocol
  • type: enum rc_type
    protocol of last keypress

last_scancode
  • type: u32
    scancode of last keypress

last_toggle
  • type: u8
toggle value of last command

**timeout**
- **type**: u32
  optional time after which device stops sending data

**min_timeout**
- **type**: u32
  minimum timeout supported by device

**max_timeout**
- **type**: u32
  maximum timeout supported by device

**rx_resolution**
- **type**: u32
  resolution (in ns) of input sampler

**tx_resolution**
- **type**: u32
  resolution (in ns) of output sampler

**change_protocol**
- **type**: int (*)(struct rc_dev *dev,u64 *rc_type)
  allow changing the protocol used on hardware decoders

**change_wakeup_protocol**
- **type**: int (*)(struct rc_dev *dev,u64 *rc_type)
  allow changing the protocol used for wakeup filtering

**open**
- **type**: int (*)(struct rc_dev *dev)
  callback to allow drivers to enable polling/irq when IR input device is opened.

**close**
- **type**: void (*)(struct rc_dev *dev)
  callback to allow drivers to disable polling/irq when IR input device is opened.

**s_tx_mask**
- **type**: int (*)(struct rc_dev *dev,u32 mask)
  set transmitter mask (for devices with multiple tx outputs)

**s_tx_carrier**
- **type**: int (*)(struct rc_dev *dev,u32 carrier)
  set transmit carrier frequency

**s_tx_duty_cycle**
- **type**: int (*)(struct rc_dev *dev,u32 duty_cycle)
  set transmit duty cycle (0% - 100%)

**s_rx_carrier_range**
- **type**: int (*)(struct rc_dev *dev,u32 min,u32 max)
inform driver about carrier it is expected to handle

**tx_ir**
- **type**: int (*)(struct rc_dev *dev,unsigned *txbuf,unsigned n)
- transmit IR

**s_idle**
- **type**: void (*)(struct rc_dev *dev,bool enable)
- enable/disable hardware idle mode, upon which, device doesn’t interrupt host until it sees IR pulses

**s_learning_mode**
- **type**: int (*)(struct rc_dev *dev,int enable)
- enable wide band receiver used for learning

**s_carrier_report**
- **type**: int (*)(struct rc_dev *dev,int enable)
- enable carrier reports

**s_filter**
- **type**: int (*)(struct rc_dev *dev,struct rc_scancode_filter *filter)
- set the scancode filter

**s_wakeup_filter**
- **type**: int (*)(struct rc_dev *dev,struct rc_scancode_filter *filter)
- set the wakeup scancode filter

**s_timeout**
- **type**: int (*)(struct rc_dev *dev,unsigned int timeout)
- set hardware timeout in ns

```c
struct rc_dev * rc_allocate_device(void)
    Allocates a RC device

Parameters
void no arguments

Description
returns a pointer to struct rc_dev.
```

```c
void rc_free_device(struct rc_dev * dev)
    Frees a RC device

Parameters
struct rc_dev * dev pointer to struct rc_dev.
```

```c
int rc_register_device(struct rc_dev * dev)
    Registers a RC device

Parameters
struct rc_dev * dev pointer to struct rc_dev.
```

```c
void rc_unregister_device(struct rc_dev * dev)
    Unregisters a RC device

Parameters
struct rc_dev * dev pointer to struct rc_dev.
```
int `rc_open`(struct `rc_dev` * `rdev`)  
Opens a RC device

**Parameters**

`struct rc_dev * rdev` pointer to struct `rc_dev`.

void `rc_close`(struct `rc_dev` * `rdev`)  
Closes a RC device

**Parameters**

`struct rc_dev * rdev` pointer to struct `rc_dev`.

int `rc_map_register`(struct `rc_map_list` * `map`)  
Registers a Remote Controller scancode map

**Parameters**

`struct rc_map_list * map` pointer to struct `rc_map_list`

void `rc_map_unregister`(struct `rc_map_list` * `map`)  
Unregisters a Remote Controller scancode map

**Parameters**

`struct rc_map_list * map` pointer to struct `rc_map_list`

struct `rc_map` * `rc_map_get`(const char * `name`)  
gets an RC map from its name

**Parameters**

const char * `name` name of the RC scancode map

### 2.8.2 LIRC

**Definition**

```c
struct lirc_driver {
    char name[40];
    int minor;
    __u32 code_length;
    unsigned int buffer_size;
    int sample_rate;
    __u32 features;
    unsigned int chunk_size;
    void * data;
    int min_timeout;
    int max_timeout;
    int (* add_to_buf) (void *data, struct lirc_buffer *buf);
    struct lirc_buffer * rbuf;
    int (* set_use_inc) (void *data);
    void (* set_use_dec) (void *data);
    struct rc_dev * rdev;
    const struct file_operations * fops;
    struct device * dev;
    struct module * owner;
};
```

**Members**

name[40]
Linux Media Subsystem Documentation, Release 4.7.0+

- **type:** char
  
  this string will be used for logs

**minor**

- **type:** int
  
  indicates minor device (/dev/lirc) number for registered driver if caller fills it with negative value, then the first free minor number will be used (if available).

**code_length**

- **type:** __u32
  
  length of the remote control key code expressed in bits.

**buffer_size**

- **type:** unsigned int
  
  Number of FIFO buffers with **chunk_size** size. If zero, creates a buffer with BUFLEN size (16 bytes).

**sample_rate**

- **type:** int
  
  if zero, the device will wait for an event with a new code to be parsed. Otherwise, specifies the sample rate for polling. Value should be between 0 and HZ. If equal to HZ, it would mean one polling per second.

**features**

- **type:** __u32
  
  lirc compatible hardware features, like LIRC_MODE_RAW, LIRC_CAN_*, as defined at include/media/lirc.h.

**chunk_size**

- **type:** unsigned int
  
  Size of each FIFO buffer.

**data**

- **type:** void *
  
  it may point to any driver data and this pointer will be passed to all callback functions.

**min_timeout**

- **type:** int
  
  Minimum timeout for record. Valid only if LIRC_CAN_SET_REC_TIMEOUT is defined.

**max_timeout**

- **type:** int
  
  Maximum timeout for record. Valid only if LIRC_CAN_SET_REC_TIMEOUT is defined.

**add_to_buf**

- **type:** int (*)(void *data,struct lirc_buffer *buf)
  
  add_to_buf will be called after specified period of the time or triggered by the external event, this behavior depends on value of the sample_rate this function will be called in user context. This routine should return 0 if data was added to the buffer and -ENODATA if none was available. This should add some number of bits evenly divisible by code_length to the buffer.

**rbuf**

- **type:** struct lirc_buffer *
if not NULL, it will be used as a read buffer, you will have to write to the buffer by other means, like
irq’s (see also lirc_serial.c).

set_use_inc
  • **type**: int (*)(void *data)
    set_use_inc will be called after device is opened

set_use_dec
  • **type**: void (*)(void *data)
    set_use_dec will be called after device is closed

**rdev**
  • **type**: struct rc_dev *
    Pointed to struct rc_dev associated with the LIRC device.

**fops**
  • **type**: const struct file_operations *
    file_operations for drivers which don’t fit the current driver model. Some ioctl’s can be directly
    handled by lirc_dev if the driver’s ioctl function is NULL or if it returns -ENOIOCTLCMD (see also
    lirc_serial.c).

**dev**
  • **type**: struct device *
    pointer to the struct device associated with the LIRC device.

**owner**
  • **type**: struct module *
    the module owning this struct

## 2.9 Media Controller devices

### 2.9.1 Media Controller

The media controller userspace API is documented in the Media Controller uAPI book. This document
focus on the kernel-side implementation of the media framework.

**Abstract media device model**

Discovering a device internal topology, and configuring it at runtime, is one of the goals of the media
framework. To achieve this, hardware devices are modelled as an oriented graph of building blocks called
entities connected through pads.

An entity is a basic media hardware building block. It can correspond to a large variety of logical blocks
such as physical hardware devices (CMOS sensor for instance), logical hardware devices (a building block
in a System-on-Chip image processing pipeline), DMA channels or physical connectors.

A pad is a connection endpoint through which an entity can interact with other entities. Data (not restricted
to video) produced by an entity flows from the entity’s output to one or more entity inputs. Pads should
not be confused with physical pins at chip boundaries.

A link is a point-to-point oriented connection between two pads, either on the same entity or on different
entities. Data flows from a source pad to a sink pad.
Media device

A media device is represented by a `struct media_device` instance, defined in `include/media/media-device.h`. Allocation of the structure is handled by the media device driver, usually by embedding the `media_device` instance in a larger driver-specific structure.

Drivers register media device instances by calling `__media_device_register()` via the macro `media_device_register()` and unregistered by calling `media_device_unregister()`.

Entities

Entities are represented by a `struct media_entity` instance, defined in `include/media/media-entity.h`. The structure is usually embedded into a higher-level structure, such as `v4l2_subdev` or `video_device` instances, although drivers can allocate entities directly.

Drivers initialize entity pads by calling `media_entity_pads_init()`.

Drivers register entities with a media device by calling `media_device_register_entity()` and unregistered by calling `media_device_unregister_entity()`.

Interfaces

Interfaces are represented by a `struct media_interface` instance, defined in `include/media/media-entity.h`. Currently, only one type of interface is defined: a device node. Such interfaces are represented by a `struct media_intf_devnode`.

Drivers initialize and create device node interfaces by calling `media_devnode_create()` and remove them by calling: `media_devnode_remove()`.

Pads

Pads are represented by a `struct media_pad` instance, defined in `include/media/media-entity.h`. Each entity stores its pads in a pads array managed by the entity driver. Drivers usually embed the array in a driver-specific structure.

Pads are identified by their entity and their 0-based index in the pads array.

Both information are stored in the `struct media_pad`, making the `media_pad` pointer the canonical way to store and pass link references.

Pads have flags that describe the pad capabilities and state. `MEDIA_PAD_FL_SINK` indicates that the pad supports sinking data. `MEDIA_PAD_FL_SOURCE` indicates that the pad supports sourcing data.

Note:

One and only one of `MEDIA_PAD_FL_SINK` or `MEDIA_PAD_FL_SOURCE` must be set for each pad.

Links

Links are represented by a `struct media_link` instance, defined in `include/media/media-entity.h`. There are two types of links:

1. pad to pad links:

Associate two entities via their PADS. Each entity has a list that points to all links originating at or targeting any of its pads. A given link is thus stored twice, once in the source entity and once in the target entity.
Drivers create pad to pad links by calling: `media_create_pad_link()` and remove with `media_entity_remove_links()`.

### 2. interface to entity links:

Associate one interface to a Link.

Drivers create interface to entity links by calling: `media_create_intf_link()` and remove with `media_remove_intf_links()`.

**Note:**

Links can only be created after having both ends already created.

Links have flags that describe the link capabilities and state. The valid values are described at `media_create_pad_link()` and `media_create_intf_link()`.

### Graph traversal

The media framework provides APIs to iterate over entities in a graph.

To iterate over all entities belonging to a media device, drivers can use the `media_device_for_each_entity` macro, defined in `include/media/media-device.h`.

```c
struct media_entity *entity;
media_device_for_each_entity(entity, mdev) {
    // entity will point to each entity in turn
    ...
}
```

Drivers might also need to iterate over all entities in a graph that can be reached only through enabled links starting at a given entity. The media framework provides a depth-first graph traversal API for that purpose.

**Note:**

Graphs with cycles (whether directed or undirected) are **NOT** supported by the graph traversal API. To prevent infinite loops, the graph traversal code limits the maximum depth to `MEDIA_ENTITY_ENUM_MAX_DEPTH`, currently defined as 16.

Drivers initiate a graph traversal by calling `media_entity_graph_walk_start()`

The graph structure, provided by the caller, is initialized to start graph traversal at the given entity.

Drivers can then retrieve the next entity by calling `media_entity_graph_walk_next()`

When the graph traversal is complete the function will return `NULL`.

Graph traversal can be interrupted at any moment. No cleanup function call is required and the graph structure can be freed normally.

Helper functions can be used to find a link between two given pads, or a pad connected to another pad through an enabled link `media_entity_find_link()` and `media_entity_remote_pad()`.

### Use count and power handling

Due to the wide differences between drivers regarding power management needs, the media controller does not implement power management. However, the `struct media_entity` includes a use_count field that media drivers can use to track the number of users of every entity for power management needs.
The `media_entity.use_count` field is owned by media drivers and must not be touched by entity drivers. Access to the field must be protected by the `media_device.graph_mutex` lock.

**Links setup**

Link properties can be modified at runtime by calling `media_entity_setup_link()`.

**Pipelines and media streams**

When starting streaming, drivers must notify all entities in the pipeline to prevent link states from being modified during streaming by calling `media_entity_pipeline_start()`.

The function will mark all entities connected to the given entity through enabled links, either directly or indirectly, as streaming.

The `struct media_pipeline` instance pointed to by the pipe argument will be stored in every entity in the pipeline. Drivers should embed the `struct media_pipeline` in higher-level pipeline structures and can then access the pipeline through the `struct media_entity.pipe` field.

Calls to `media_entity_pipeline_start()` can be nested. The pipeline pointer must be identical for all nested calls to the function. `media_entity_pipeline_start()` may return an error. In that case, it will clean up any of the changes it did by itself.

When stopping the stream, drivers must notify the entities with `media_entity_pipeline_stop()`.

If multiple calls to `media_entity_pipeline_start()` have been made the same number of `media_entity_pipeline_stop()` calls are required to stop streaming. The `media_entity.pipe` field is reset to `NULL` on the last nested stop call.

Link configuration will fail with `-EBUSY` by default if either end of the link is a streaming entity. Links that can be modified while streaming must be marked with the `MEDIA_LNK_FL_DYNAMIC` flag.

If other operations need to be disallowed on streaming entities (such as changing entities configuration parameters) drivers can explicitly check the `media_entity.stream_count` field to find out if an entity is streaming. This operation must be done with the `media_device.graph_mutex` held.

**Link validation**

Link validation is performed by `media_entity_pipeline_start()` for any entity which has sink pads in the pipeline. The `media_entity.link_validate()` callback is used for that purpose. In `link_validate()` callback, entity driver should check that the properties of the source pad of the connected entity and its own sink pad match. It is up to the type of the entity (and in the end, the properties of the hardware) what matching actually means.

Subsystems should facilitate link validation by providing subsystem specific helper functions to provide easy access for commonly needed information, and in the end provide a way to use driver-specific callbacks.

**struct media_entity_notify**

---

**Definition**

```c
struct media_entity_notify {
    struct list_head list;
    void * notify_data;
    void (* notify) (struct media_entity *entity, void *notify_data);
};
```

**Members**

---

Chapter 2. Media subsystem kernel internal API
**list**
- **type**: `struct list_head`
  List head

**notify_data**
- **type**: `void *`
  Input data to invoke the callback

**notify**
- **type**: `void (*)(struct media_entity *entity,void *notify_data)`
  Callback function pointer

**Description**
Drivers may register a callback to take action when new entities get registered with the media device.

**struct media_device**
Media device

**Definition**

```c
struct media_device {
    struct device * dev;
    struct media_devnode * devnode;
    char model[32];
    char driver_name[32];
    char serial[40];
    char bus_info[32];
    u32 hw_revision;
    u32 driver_version;
    u64 topology_version;
    u32 id;
    struct ida entity_internal_idx;
    int entity_internal_idx_max;
    struct list_head entities;
    struct list_head interfaces;
    struct list_head pads;
    struct list_head links;
    struct list_head entity_notify;
    struct mutex graph_mutex;
    struct media_entity_graph pm_count_walk;
    void * source_priv;
    int (* enable_source) (struct media_entity *entity,struct media_pipeline *pipe);
    void (* disable_source) (struct media_entity *entity);
    int (* link_notify) (struct media_link *link, u32 flags,unsigned int notification);
};
```

**Members**

**dev**
- **type**: `struct device *`
  Parent device

**devnode**
- **type**: `struct media_devnode *`
  Media device node

**model[32]**
- **type**: `char`

2.9. Media Controller devices
Device model name

driver_name[32]
  • type: char
  Optional device driver name. If not set, calls to MEDIA_IOC_DEVICE_INFO will return dev->driver->name. This is needed for USB drivers for example, as otherwise they’ll all appear as if the driver name was “usb”.

serial[40]
  • type: char
  Device serial number (optional)

bus_info[32]
  • type: char
  Unique and stable device location identifier

hw_revision
  • type: u32
  Hardware device revision

driver_version
  • type: u32
  Device driver version

topology_version
  • type: u64
  Monotonic counter for storing the version of the graph topology. Should be incremented each time the topology changes.

id
  • type: u32
  Unique ID used on the last registered graph object

topology_version
  • type: struct ida
  Unique internal entity ID used by the graph traversal algorithms

entity_internal_idx_max
  • type: int
  Allocated internal entity indices

topology_version
  • type: struct list_head
  List of registered entities

interfaces
  • type: struct list_head
  List of registered interfaces

pads
  • type: struct list_head
  List of registered pads
links
  • type: struct list_head
    List of registered links

entity_notify
  • type: struct list_head
    List of registered entity_notify callbacks

graph_mutex
  • type: struct mutex
    Protects access to struct media_device data

pm_count_walk
  • type: struct media_entity_graph
    Graph walk for power state walk. Access serialised using graph_mutex.

source_priv
  • type: void *
    Driver Private data for enable/disable source handlers

enable_source
  • type: int (*)(struct media_entity *entity, struct media_pipeline *pipe)
    Enable Source Handler function pointer

disable_source
  • type: void (*)(struct media_entity *entity)
    Disable Source Handler function pointer

link_notify
  • type: int (*)(struct media_link *link, u32 flags, unsigned int notification)
    Link state change notification callback. This callback is called with the graph_mutex held.

Description
This structure represents an abstract high-level media device. It allows easy access to entities and provides basic media device-level support. The structure can be allocated directly or embedded in a larger structure.

The parent `dev` is a physical device. It must be set before registering the media device.

`model` is a descriptive model name exported through sysfs. It doesn’t have to be unique.

`enable_source` is a handler to find source entity for the sink entity and activate the link between them if source entity is free. Drivers should call this handler before accessing the source.

`disable_source` is a handler to find source entity for the sink entity and deactivate the link between them. Drivers should call this handler to release the source.

Note
Bridge driver is expected to implement and set the handler when media_device is registered or when bridge driver finds the media_device during probe. Bridge driver sets source_priv with information necessary to run enable/disable source handlers.

Use-case: find tuner entity connected to the decoder entity and check if it is available, and activate the the link between them from enable_source and deactivate from disable_source.

```c
int media_entity_enum_init(struct media_entity_enum *ent_enum, struct media_device *mdev)
```
Initialise an entity enumeration

2.9. Media Controller devices
Parameters
struct media_entity_enum * ent_enum Entity enumeration to be initialised
struct media_device * mdev The related media device

Description
Returns zero on success or a negative error code.

void media_device_init(struct media_device * mdev)
  Initializes a media device element

Parameters
struct media_device * mdev pointer to struct media_device

Description
This function initializes the media device prior to its registration. The media device initialization and registration is split in two functions to avoid race conditions and make the media device available to user-space before the media graph has been completed.

So drivers need to first initialize the media device, register any entity within the media device, create pad to pad links and then finally register the media device by calling media_device_register() as a final step.

void media_device_cleanup(struct media_device * mdev)
  Cleansups a media device element

Parameters
struct media_device * mdev pointer to struct media_device

Description
This function that will destroy the graph_mutex that is initialized in media_device_init().

int __media_device_register(struct media_device * mdev, struct module * owner)
  Registers a media device element

Parameters
struct media_device * mdev pointer to struct media_device
struct module * owner should be filled with THIS_MODULE

Description
Users, should, instead, call the media_device_register() macro.

The caller is responsible for initializing the media_device structure before registration. The following fields must be set:

• dev must point to the parent device (usually a pci_dev, usb_interface or platform_device instance).

• model must be filled with the device model name as a NUL-terminated UTF-8 string. The device/model revision must not be stored in this field.

The following fields are optional:

• serial is a unique serial number stored as a NUL-terminated ASCII string. The field is big enough to store a GUID in text form. If the hardware doesn’t provide a unique serial number this field must be left empty.

• bus_info represents the location of the device in the system as a NUL-terminated ASCII string. For PCI/PCIe devices bus_info must be set to “PCI:” (or “PCle:”) followed by the value of pci_name(). For USB devices, the usb_make_path() function must be used. This field is used by applications to distinguish between otherwise identical devices that don’t provide a serial number.
• `hw_revision` is the hardware device revision in a driver-specific format. When possible the revision should be formatted with the KERNEL_VERSION macro.

• `driver_version` is formatted with the KERNEL_VERSION macro. The version minor must be incremented when new features are added to the userspace API without breaking binary compatibility. The version major must be incremented when binary compatibility is broken.

**Note:**

1. Upon successful registration a character device named media[0-9]+ is created. The device major and minor numbers are dynamic. The model name is exported as a sysfs attribute.
2. Unregistering a media device that hasn’t been registered is **NOT** safe.

Return

returns zero on success or a negative error code.

```c
void media_device_unregister(struct media_device * mdev)
```

Unregisters a media device element

**Parameters**

`struct media_device * mdev` pointer to struct `media_device`

**Description**

It is safe to call this function on an unregistered (but initialised) media device.

```c
int media_device_register_entity(struct media_device * mdev, struct media_entity * entity)
```

registers a media entity inside a previously registered media device.

**Parameters**

`struct media_device * mdev` pointer to struct `media_device`

`struct media_entity * entity` pointer to struct `media_entity` to be registered

**Description**

Entities are identified by a unique positive integer ID. The media controller framework will such ID automatically. IDs are not guaranteed to be contiguous, and the ID number can change on newer Kernel versions. So, neither the driver nor userspace should hardcode ID numbers to refer to the entities, but, instead, use the framework to find the ID, when needed.

The `media_entity` name, type and flags fields should be initialized before calling `media_device_register_entity()`. Entities embedded in higher-level standard structures can have some of those fields set by the higher-level framework.

If the device has pads, `media_entity_pads_init()` should be called before this function. Otherwise, the `media_entity`.*pad** and `media_entity`.*num_pads** should be zeroed before calling this function.

Entities have flags that describe the entity capabilities and state:

**MEDIA_ENT_FL_DEFAULT** indicates the default entity for a given type. This can be used to report the default audio and video devices or the default camera sensor.

**Note:**

Drivers should set the entity function before calling this function. Please notice that the values `MEDIA_ENT_F_V4L2_SUBDEV_UNKNOWN` and `MEDIA_ENT_F.UNKNOWN` should not be used by the drivers.

```c
void media_device_unregister_entity(struct media_entity * entity)
```

Unregisters a media entity.

**Parameters**

2.9. Media Controller devices
struct media_entity * entity pointer to struct media_entity to be unregistered

Description

All links associated with the entity and all PADs are automatically unregistered from the media_device when this function is called.

Unregistering an entity will not change the IDs of the other entities and the previously used ID will never be reused for a newly registered entities.

When a media device is unregistered, all its entities are unregistered automatically. No manual entities unregistration is then required.

Note: The media_entity instance itself must be freed explicitly by the driver if required.

int media_device_register_entity_notify(struct media_device * mdev, struct media_entity_notify * nptr)

Registers a media entity_notify callback

Parameters

struct media_device * mdev The media device
struct media_entity_notify * nptr The media_entity_notify

Note

When a new entity is registered, all the registered media_entity_notify callbacks are invoked.

void media_device_unregister_entity_notify(struct media_device * mdev, struct media_entity_notify * nptr)

Unregister a media entity notify callback

Parameters

struct media_device * mdev The media device
struct media_entity_notify * nptr The media_entity_notify

struct media_device * media_device_get_devres(struct device * dev)

get media device as device resource creates if one doesn’t exist

Parameters

struct device * dev pointer to struct device.

Description

Sometimes, the media controller media_device needs to be shared by more than one driver. This function adds support for that, by dynamically allocating the media_device and allowing it to be obtained from the struct device associated with the common device where all sub-device components belong. So, for example, on an USB device with multiple interfaces, each interface may be handled by a separate per-interface drivers. While each interface have its own device, they all share a common device associated with the hole USB device.

struct media_device * media_device_find_devres(struct device * dev)

find media device as device resource

Parameters

struct device * dev pointer to struct device.

void media_device_pci_init(struct media_device * mdev, struct pci_dev * pci_dev, const char * name)

create and initialize a struct media_device from a PCI device.

Parameters
void __media_device_usb_init(struct media_device * mdev, struct usb_device * udev, const char * board_name, const char * driver_name)
{
    create and initialize a struct media_device from a PCI device.
}

Parameters

struct media_device * mdev  pointer to struct media_device
struct usb_device * udev  pointer to struct usb_device
const char * board_name  media device name. If NULL, the routine will use the usb product name, if available.
const char * driver_name  name of the driver. If NULL, the routine will use the name given by udev->dev->driver->name, with is usually the wrong thing to do.

NOTE
It is better to call media_device_usb_init() instead, as such macro fills driver_name with KBUILD_MODNAME.

struct media_file_operations
Media device file operations

Definition

struct media_file_operations {
    struct module * owner;
    ssize_t (* read) (struct file *, char __user *, size_t, loff_t *);
    ssize_t (* write) (struct file *, const char __user *, size_t, loff_t *);
    unsigned int (* poll) (struct file *, struct poll_table_struct *);
    long (* ioctl) (struct file *, unsigned int, unsigned long);
    long (* compat_ioctl) (struct file *, unsigned int, unsigned long);
    int (* open) (struct file *);
    int (* release) (struct file *);
};

Members

owner

    • **type**: struct module *
    should be filled with THIS_MODULE
read

    • **type**: ssize_t (*) (struct file *,char __user *,size_t,loff_t *)
    pointer to the function that implements read() syscall
write

    • **type**: ssize_t (*) (struct file *,const char __user *,size_t,loff_t *)
    pointer to the function that implements write() syscall
poll

    • **type**: unsigned int (*) (struct file *,struct poll_table_struct *)
    pointer to the function that implements poll() syscall
ioctl
• **type:** long (*) (struct file *, unsigned int, unsigned long)
  pointer to the function that implements `ioctl()` syscall

compat_ioctl
• **type:** long (*) (struct file *, unsigned int, unsigned long)
  pointer to the function that will handle 32 bits userspace calls to the `ioctl()` syscall on a Kernel compiled with 64 bits.

open
• **type:** int (*) (struct file *)
  pointer to the function that implements `open()` syscall

release
• **type:** int (*) (struct file *)
  pointer to the function that will release the resources allocated by the `open` function.

struct **media_devnode**

  Media device node

**Definition**

```c
struct media_devnode {
  struct media_device * media_dev;
  const struct media_file_operations * fops;
  struct device dev;
  struct cdev cdev;
  struct device * parent;
  int minor;
  unsigned long flags;
  void (* release) (struct media_devnode *devnode);
};
```

**Members**

media_dev
• **type:** struct media_device *
  pointer to struct `media_device`

fops
• **type:** const struct media_file_operations *
  pointer to struct `media_file_operations` with media device ops

dev
• **type:** struct device
  pointer to struct device containing the media controller device

cdev
• **type:** struct cdev
  struct cdev pointer character device

parent
• **type:** struct device *
  parent device

minor
• **type:** int
device node minor number

flags

- **type**: unsigned long
  flags, combination of the MEDIA_FLAG_* constants

release

- **type**: void (*)(struct media_devnode *devnode)
  release callback called at the end of media_devnode_release()

**Description**

This structure represents a media-related device node.

The **parent** is a physical device. It must be set by core or device drivers before registering the node.

```c
int media_devnode_register(struct media_device *mdev, struct media_devnode *devnode, struct module *owner)
```

register a media device node

**Parameters**

- **struct media_device * mdev**: struct media_device we want to register a device node
- **struct media_devnode * devnode**: media device node structure we want to register
- **struct module * owner**: should be filled with THIS_MODULE

**Description**

The registration code assigns minor numbers and registers the new device node with the kernel. An error is returned if no free minor number can be found, or if the registration of the device node fails.

Zero is returned on success.

Note that if the media_devnode_register call fails, the release() callback of the media_devnode structure is **not** called, so the caller is responsible for freeing any data.

```c
void media_devnode_unregister_prepare(struct media_devnode *devnode)
```

clear the media device node register bit

**Parameters**

- **struct media_devnode * devnode**: the device node to prepare for unregister

**Description**

This clears the passed device register bit. Future open calls will be met with errors. Should be called before media_devnode_unregister() to avoid races with unregister and device file open calls.

This function can safely be called if the device node has never been registered or has already been unregistered.

```c
void media_devnode_unregister(struct media_devnode *devnode)
```

unregister a media device node

**Parameters**

- **struct media_devnode * devnode**: the device node to unregister

**Description**

This unregisters the passed device. Future open calls will be met with errors.

Should be called after media_devnode_unregister_prepare()

```c
struct media_devnode * media_devnode_data(struct file *filp)
```

returns a pointer to the media_devnode

**Parameters**

- **struct file * filp**
struct file * filp pointer to struct file

int media_devnode_is_registered(struct media_devnode * devnode)
returns true if media_devnode is registered; false otherwise.

Parameters
struct media_devnode * devnode pointer to struct media_devnode.

Note
If mdev is NULL, it also returns false.

enum media_gobj_type
type of a graph object

Constants
MEDIA_GRAPH_ENTITY Identify a media entity
MEDIA_GRAPH_PAD Identify a media pad
MEDIA_GRAPH_LINK Identify a media link
MEDIA_GRAPH_INTF_DEVNODE Identify a media Kernel API interface via a device node

struct media_gobj
  Define a graph object.

Definition

struct media_gobj {
  struct media_device * mdev;
  u32 id;
  struct list_head list;
};

Members
mdev
  • type: struct media_device *
    Pointer to the struct media_device that owns the object

id
  • type: u32
    Non-zero object ID identifier. The ID should be unique inside a media_device, as it is composed by
    MEDIA_BITS_PER_TYPE to store the type plus MEDIA_BITS_PER_ID to store the ID

list
  • type: struct list_head
    List entry stored in one of the per-type mdev object lists

Description
All objects on the media graph should have this struct embedded

struct media_entity_enum
  An enumeration of media entities.

Definition

struct media_entity_enum {
  unsigned long * bmap;
  int idx_max;
};
Members

bmap
  • type: unsigned long *
   Bit map in which each bit represents one entity at struct media_entity->internal_idx.

idx_max
  • type: int
   Number of bits in bmap

struct media_entity_graph
   Media graph traversal state

Definition

struct media_entity_graph {
  struct stack[MEDIA_ENTITY_ENUM_MAX_DEPTH];
  struct media_entity_enum ent_enum;
  int top;
};

Members

stack[MEDIAENTITY_ENUM_MAXDEPTH]
  • type: struct
   Graph traversal stack; the stack contains information on the path the media entities to be walked and the links through which they were reached.

ent_enum
  • type: struct media_entity_enum
   Visited entities

top
  • type: int
   The top of the stack

struct media_pipeline
   Media pipeline related information

Definition

struct media_pipeline {
  int streaming_count;
  struct media_entity_graph graph;
};

Members

streaming_count
  • type: int
   Streaming start count - streaming stop count

graph
  • type: struct media_entity_graph
   Media graph walk during pipeline start / stop

struct media_link
   A link object part of a media graph.
Definition

```c
struct media_link {
    struct media_gobj graph_obj;
    struct list_head list;
    union {unnamed_union};
    struct media_link * reverse;
    unsigned long flags;
    bool is_backlink;
};
```

Members

**graph_obj**
- **type**: struct media_gobj
  - Embedded structure containing the media object common data

**list**
- **type**: struct list_head
  - Linked list associated with an entity or an interface that owns the link.

{**unnamed_union**}
- **type**: union
  - anonymous

**reverse**
- **type**: struct media_link *
  - Pointer to the link for the reverse direction of a pad to pad link.

**flags**
- **type**: unsigned long
  - Link flags, as defined in uapi/media.h (MEDIA_LNK_FL_*)

**is_backlink**
- **type**: bool
  - Indicate if the link is a backlink.

struct media_pad
- A media pad graph object.

Definition

```c
struct media_pad {
    struct media_gobj graph_obj;
    struct media_entity * entity;
    u16 index;
    unsigned long flags;
};
```

Members

**graph_obj**
- **type**: struct media_gobj
  - Embedded structure containing the media object common data

**entity**
- **type**: struct media_entity *
Entity this pad belongs to

**index**
- **type**: u16
  Pad index in the entity pads array, numbered from 0 to n

**flags**
- **type**: unsigned long
  Pad flags, as defined in uapi/media.h (MEDIA_PAD_FL_*)

```c
struct media_entity_operations
  Media entity operations

Definition
```

```c
struct media_entity_operations {
  int (*link_setup)(struct media_entity *entity, const struct media_pad *local, const struct media_pad *remote, u32 flags);
  int (*link_validate)(struct media_link *link);
};
```

**Members**

**link_setup**
- **type**: int (*)(struct media_entity *entity, const struct media_pad *local, const struct media_pad *remote, u32 flags)
  Notify the entity of link changes. The operation can return an error, in which case link setup will be cancelled. Optional.

**link_validate**
- **type**: int (*)(struct media_link *link)
  Return whether a link is valid from the entity point of view. The media_entity_pipeline_start() function validates all links by calling this operation. Optional.

**Description**

**Note:**
Those these callbacks are called with struct media_device.**graph_mutex** mutex held.

```c
enum media_entity_type
  Media entity type
```

**Constants**

- **MEDIA_ENTITY_TYPE_BASE** The entity isn’t embedded in another subsystem structure.
- **MEDIA_ENTITY_TYPE_VIDEO_DEVICE** The entity is embedded in a struct video_device instance.
- **MEDIA_ENTITY_TYPE_V4L2_SUBDEV** The entity is embedded in a struct v4l2_subdev instance.

**Description**

Media entity objects are often not instantiated directly, but the media entity structure is inherited by (through embedding) other subsystem-specific structures. The media entity type identifies the type of the subclass structure that implements a media entity instance.

This allows runtime type identification of media entities and safe casting to the correct object type. For instance, a media entity structure instance embedded in a v4l2_subdev structure instance will have the type MEDIA_ENTITY_TYPE_V4L2_SUBDEV and can safely be cast to a v4l2_subdev structure using the container_of() macro.
struct media_entity
   A media entity graph object.

Definition

```c
struct media_entity {
    struct media_gobj graph_obj;
    const char * name;
    enum media_entity_type obj_type;
    u32 function;
    unsigned long flags;
    u16 num_pads;
    u16 num_links;
    u16 num_backlinks;
    int internal_idx;
    struct media_pad * pads;
    struct list_head links;
    const struct media_entity_operations * ops;
    int stream_count;
    int use_count;
    struct media_pipeline * pipe;
    union info;
};
```

Members

graph_obj
   • type: struct media_gobj
      Embedded structure containing the media object common data.

name
   • type: const char *
      Entity name.

obj_type
   • type: enum media_entity_type
      Type of the object that implements the media_entity.

function
   • type: u32
      Entity main function, as defined in uapi/media.h (MEDIA_ENT_F_*)

flags
   • type: unsigned long
      Entity flags, as defined in uapi/media.h (MEDIA_ENT_FL_*)

num_pads
   • type: u16
      Number of sink and source pads.

num_links
   • type: u16
      Total number of links, forward and back, enabled and disabled.

num_backlinks
   • type: u16
Number of backlinks

### internal_idx
- **type**: int
  
  An unique internal entity specific number. The numbers are re-used if entities are unregistered or registered again.

### pads
- **type**: struct media_pad *
  
  Pads array with the size defined by **num_pads**.

### links
- **type**: struct list_head
  
  List of data links.

### ops
- **type**: const struct media_entity_operations *
  
  Entity operations.

### stream_count
- **type**: int
  
  Stream count for the entity.

### use_count
- **type**: int
  
  Use count for the entity.

### pipe
- **type**: struct media_pipeline *
  
  Pipeline this entity belongs to.

### info
- **type**: union
  
  Union with devnode information. Kept just for backward compatibility.

**NOTE**

stream_count and use_count reference counts must never be negative, but are signed integers on purpose: a simple WARN_ON(<0) check can be used to detect reference count bugs that would make them negative.

**struct media_interface**

A media interface graph object.

**Definition**

```c
struct media_interface {
    struct media_gobj graph_obj;
    struct list_head links;
    u32 type;
    u32 flags;
};
```

**Members**

**graph_obj**
- **type**: struct media_gobj

2.9. Media Controller devices
embedded graph object

**links**

- **type**: `struct list_head`
  
  List of links pointing to graph entities

**type**

- **type**: `u32`
  
  Type of the interface as defined in the `uapi/media/media.h` header, e.g. `MEDIA_INTF_T_*`

**flags**

- **type**: `u32`
  
  Interface flags as defined in `uapi/media/media.h`

**struct media_intf_devnode**

A media interface via a device node.

**Definition**

```c
struct media_intf_devnode {
    struct media_interface intf;
    u32 major;
    u32 minor;
};
```

**Members**

**intf**

- **type**: `struct media_interface`
  
  embedded interface object

**major**

- **type**: `u32`
  
  Major number of a device node

**minor**

- **type**: `u32`
  
  Minor number of a device node

**u32 media_entity_id**(struct `media_entity * entity`)

return the media entity graph object id

**Parameters**

- **struct media_entity * entity** pointer to entity

**enum media_gobj_type media_type**(struct `media_gobj * gobj`)

return the media object type

**Parameters**

- **struct media_gobj * gobj** pointer to the media graph object

**u32 media_id**(struct `media_gobj * gobj`)

return the media object ID

**Parameters**

- **struct media_gobj * gobj** pointer to the media graph object

**u32 media_gobj_gen_id**(enum `media_gobj_type` type, u64 `local_id`)

encapsulates type and ID on at the object ID
Parameters

enum media_gobj_type type object type as define at enum media_gobj_type.

u64 local_id next ID, from struct media_device.*id**.

bool is_media_entity_v4l2_video_device(struct media_entity * entity)
   Check if the entity is a video_device

Parameters

struct media_entity * entity pointer to entity

Return

ture if the entity is an instance of a video_device object and can safely be cast to a struct video_device using the container_of() macro, or false otherwise.

bool is_media_entity_v4l2_subdev(struct media_entity * entity)
   Check if the entity is a v4l2_subdev

Parameters

struct media_entity * entity pointer to entity

Return

ture if the entity is an instance of a v4l2_subdev object and can safely be cast to a struct v4l2_subdev using the container_of() macro, or false otherwise.

int __media_entity_enum_init(struct media_entity_enum * ent_enum, int idx_max)
   Initialise an entity enumeration

Parameters

struct media_entity_enum * ent_enum Entity enumeration to be initialised

int idx_max Maximum number of entities in the enumeration

Return

Returns zero on success or a negative error code.

void media_entity_enum_cleanup(struct media_entity_enum * ent_enum)
   Release resources of an entity enumeration

Parameters

struct media_entity_enum * ent_enum Entity enumeration to be released

void media_entity_enum_zero(struct media_entity_enum * ent_enum)
   Clear the entire enum

Parameters

struct media_entity_enum * ent_enum Entity enumeration to be cleared

void media_entity_enum_set(struct media_entity_enum * ent_enum, struct media_entity * entity)
   Mark a single entity in the enum

Parameters

struct media_entity_enum * ent_enum Entity enumeration

struct media_entity * entity Entity to be marked

void media_entity_enum_clear(struct media_entity_enum * ent_enum, struct media_entity * entity)
   Unmark a single entity in the enum

Parameters

struct media_entity_enum * ent_enum Entity enumeration

2.9. Media Controller devices
struct media_entity * entity  Entity to be unmarked

bool media_entity_enum_test(struct media_entity_enum * ent_enum, struct media_entity * entity)
    Test whether the entity is marked

Parameters
struct media_entity_enum * ent_enum  Entity enumeration
struct media_entity * entity  Entity to be tested

Description
Returns true if the entity was marked.

bool media_entity_enum_test_and_set(struct media_entity_enum * ent_enum, struct media_entity * entity)
    Test whether the entity is marked, and mark it

Parameters
struct media_entity_enum * ent_enum  Entity enumeration
struct media_entity * entity  Entity to be tested

Description
Returns true if the entity was marked, and mark it before doing so.

bool media_entity_enum_empty(struct media_entity_enum * ent_enum)
    Test whether the entire enum is empty

Parameters
struct media_entity_enum * ent_enum  Entity enumeration

Description
Returns true if the entity was marked.

bool media_entity_enum_intersects(struct media_entity_enum * ent_enum1, struct media_entity_enum * ent_enum2)
    Test whether two enums intersect

Parameters
struct media_entity_enum * ent_enum1  First entity enumeration
struct media_entity_enum * ent_enum2  Second entity enumeration

Description
Returns true if entity enumerations e and f intersect, otherwise false.

void media_gobj_create(struct media_device * mdev, enum media_gobj_type type, struct media_gobj * gobj)
    Initialize a graph object

Parameters
struct media_device * mdev  Pointer to the media_device that contains the object
enum media_gobj_type type  Type of the object
struct media_gobj * gobj  Pointer to the graph object

Description
This routine initializes the embedded struct media_gobj inside a media graph object. It is called automatically if media_*_create() calls are used. However, if the object (entity, link, pad, interface) is embedded on some other object, this function should be called before registering the object at the media controller.
void media_gobj_destroy(struct media_gobj * gobj)
   Stop using a graph object on a media device

Parameters
struct media_gobj * gobj Pointer to the graph object

Description
This should be called by all routines like media_device_unregister() that remove/destroy media graph objects.

int media_entity_pads_init(struct media_entity * entity, u16 num_pads, struct media_pad * pads)
   Initialize the entity pads

Parameters
struct media_entity * entity entity where the pads belong
u16 num_pads total number of sink and source pads
struct media_pad * pads Array of num_pads pads.

Description
The pads array is managed by the entity driver and passed to media_entity_pads_init() where its pointer will be stored in the entity structure.
If no pads are needed, drivers could either directly fill media_entity->**num_pads** with 0 and media_entity->**pads** with NULL or call this function that will do the same.
As the number of pads is known in advance, the pads array is not allocated dynamically but is managed by the entity driver. Most drivers will embed the pads array in a driver-specific structure, avoiding dynamic allocation.
Drivers must set the direction of every pad in the pads array before calling media_entity_pads_init(). The function will initialize the other pads fields.

void media_entity_cleanup(struct media_entity * entity)
   free resources associated with an entity

Parameters
struct media_entity * entity entity where the pads belong

Description
This function must be called during the cleanup phase after unregistering the entity (currently, it does nothing).

int media_create_pad_link(struct media_entity * source, u16 source_pad, struct media_entity * sink, u16 sink_pad, u32 flags)
   creates a link between two entities.

Parameters
struct media_entity * source pointer to media_entity of the source pad.
u16 source_pad number of the source pad in the pads array
struct media_entity * sink pointer to media_entity of the sink pad.
u16 sink_pad number of the sink pad in the pads array.
u32 flags Link flags, as defined in include/uapi/linux/media.h.

Description
Valid values for flags:
• A MEDIA_LNK_FL_ENABLED flag indicates that the link is enabled and can be used to transfer media data. When two or more links target a sink pad, only one of them can be enabled at a time.
A MEDIA_LNK_FL_IMMUTABLE flag indicates that the link enabled state can’t be modified at runtime. If MEDIA_LNK_FL_IMMUTABLE is set, then MEDIA_LNK_FL_ENABLED must also be set since an immutable link is always enabled.

**Note:**

Before calling this function, `media_entity_pads_init()` and `media_device_register_entity()` should be called previously for both ends.

```c
int media_create_pad_links(const struct media_device * mdev, const u32 source_function, const struct media_entity * source, const u16 source_pad, const u32 sink_function, const struct media_entity * sink, const u16 sink_pad, const u32 flags, const bool allow_both_undefined)
```

creates a link between two entities.

**Parameters**

- `const struct media_device * mdev` Pointer to the media_device that contains the object
- `const u32 source_function` Function of the source entities. Used only if `source` is NULL.
- `struct media_entity * source` pointer to media_entity of the source pad. If NULL, it will use all entities that matches the `sink_function`.
- `const u16 source_pad` number of the source pad in the pads array
- `const u32 sink_function` Function of the sink entities. Used only if `sink` is NULL.
- `struct media_entity * sink` pointer to media_entity of the sink pad. If NULL, it will use all entities that matches the `sink_function`.
- `const u16 sink_pad` number of the sink pad in the pads array.
- `const u32 flags` Link flags, as defined in include/uapi/linux/media.h.
- `const bool allow_both_undefined` if true, then both `source` and `sink` can be NULL. In such case, it will create a crossbar between all entities that matches `source_function` to all entities that matches `sink_function`. If false, it will return 0 and won’t create any link if both `source` and `sink` are NULL.

**Description**

Valid values for flags:

A MEDIA_LNK_FL_ENABLED flag indicates that the link is enabled and can be used to transfer media data. If multiple links are created and this flag is passed as an argument, only the first created link will have this flag.

A MEDIA_LNK_FL_IMMUTABLE flag indicates that the link enabled state can’t be modified at run-time. If MEDIA_LNK_FL_IMMUTABLE is set, then MEDIA_LNK_FL_ENABLED must also be set since an immutable link is always enabled.

It is common for some devices to have multiple source and/or sink entities of the same type that should be linked. While `media_create_pad_links()` creates link by link, this function is meant to allow 1:n, n:1 and even cross-bar (n:n) links.

**NOTE**

Before calling this function, `media_entity_pads_init()` and `media_device_register_entity()` should be called previously for the entities to be linked.

```c
void media_entity_remove_links(struct media_entity * entity)
```

remove all links associated with an entity

**Parameters**

- `struct media_entity * entity` pointer to `media_entity`
Description

Note:

This is called automatically when an entity is unregistered via `media_device_register_entity()`.

```c
int __media_entity_setup_link(struct media_link * link, u32 flags)
Configure a media link without locking
```

**Parameters**

- `struct media_link * link` The link being configured
- `u32 flags` Link configuration flags

**Description**

The bulk of link setup is handled by the two entities connected through the link. This function notifies both entities of the link configuration change.

If the link is immutable or if the current and new configuration are identical, return immediately.

The user is expected to hold `link->source->parent->mutex`. If not, `media_entity_setup_link()` should be used instead.

```c
int media_entity_setup_link(struct media_link * link, u32 flags)
changes the link flags properties in runtime
```

**Parameters**

- `struct media_link * link` pointer to `media_link`
- `u32 flags` the requested new link flags

**Description**

The only configurable property is the `MEDIA_LNK_FL_ENABLED` link flag flag to enable/disable a link. Links marked with the `MEDIA_LNK_FL_IMMUTABLE` link flag can not be enabled or disabled.

When a link is enabled or disabled, the media framework calls the link_setup operation for the two entities at the source and sink of the link, in that order. If the second link_setup call fails, another link_setup call is made on the first entity to restore the original link flags.

Media device drivers can be notified of link setup operations by setting the `media_device::link_notify` pointer to a callback function. If provided, the notification callback will be called before enabling and after disabling links.

Entity drivers must implement the link_setup operation if any of their links is non-immutable. The operation must either configure the hardware or store the configuration information to be applied later.

Link configuration must not have any side effect on other links. If an enabled link at a sink pad prevents another link at the same pad from being enabled, the link_setup operation must return -EBUSY and can’t implicitly disable the first enabled link.

Note:

The valid values of the flags for the link is the same as described on `media_create_pad_link()`, for pad to pad links or the same as described on `media_create_intf_link()`, for interface to entity links.

```c
struct media_link * media_entity_find_link(struct media_pad * source, struct media_pad * sink)
Find a link between two pads
```

**Parameters**

- `struct media_pad * source` Source pad

2.9. Media Controller devices
struct media_pad * sink Sink pad

Description
Return a pointer to the link between the two entities. If no such link exists, return NULL.

struct media_pad * media_entity_remote_pad(struct media_pad * pad)
    Find the pad at the remote end of a link

Parameters
struct media_pad * pad Pad at the local end of the link

Description
Search for a remote pad connected to the given pad by iterating over all links originating or terminating at that pad until an enabled link is found.
Return a pointer to the pad at the remote end of the first found enabled link, or NULL if no enabled link has been found.

struct media_entity * media_entity_get(struct media_entity * entity)
    Get a reference to the parent module

Parameters
struct media_entity * entity The entity

Description
Get a reference to the parent media device module.
The function will return immediately if entity is NULL.
Return a pointer to the entity on success or NULL on failure.

void media_entity_graph_walk_cleanup(struct media_entity_graph * graph)
    Release resources used by graph walk.

Parameters
struct media_entity_graph * graph Media graph structure that will be used to walk the graph

void media_entity_put(struct media_entity * entity)
    Release the reference to the parent module

Parameters
struct media_entity * entity The entity

Description
Release the reference count acquired by media_entity_get().
The function will return immediately if entity is NULL.

void media_entity_graph_walk_start(struct media_entity_graph * graph, struct media_entity * entity)
    Start walking the media graph at a given entity

Parameters
struct media_entity_graph * graph Media graph structure that will be used to walk the graph
struct media_entity * entity Starting entity

Description
Before using this function, media_entity_graph_walk_init() must be used to allocate resources used for walking the graph. This function initializes the graph traversal structure to walk the entities graph starting at the given entity. The traversal structure must not be modified by the caller during graph traversal. After the graph walk, the resources must be released using media_entity_graph_walk_cleanup().
struct media_entity *media_entity_graph_walk_next(struct media_entity_graph *graph)
Get the next entity in the graph

Parameters

struct media_entity_graph * graph  Media graph structure

Description
Perform a depth-first traversal of the given media entities graph.
The graph structure must have been previously initialized with a call to media_entity_graph_walk_start().
Return the next entity in the graph or NULL if the whole graph have been traversed.

int media_entity_pipeline_start(struct media_entity * entity, struct media_pipeline * pipe)
Mark a pipeline as streaming

Parameters

struct media_entity * entity  Starting entity
struct media_pipeline * pipe  Media pipeline to be assigned to all entities in the pipeline.

Description
Mark all entities connected to a given entity through enabled links, either directly or indirectly, as streaming. The given pipeline object is assigned to every entity in the pipeline and stored in the media_entity pipe field.
Calls to this function can be nested, in which case the same number of media_entity_pipeline_stop() calls will be required to stop streaming. The pipeline pointer must be identical for all nested calls to media_entity_pipeline_start().

int __media_entity_pipeline_start(struct media_entity * entity, struct media_pipeline * pipe)
Mark a pipeline as streaming

Parameters

struct media_entity * entity  Starting entity
struct media_pipeline * pipe  Media pipeline to be assigned to all entities in the pipeline.

Description
..note:: This is the non-locking version of media_entity_pipeline_start()

void media_entity_pipeline_stop(struct media_entity * entity)
Mark a pipeline as not streaming

Parameters

struct media_entity * entity  Starting entity

Description
Mark all entities connected to a given entity through enabled links, either directly or indirectly, as not streaming. The media_entity pipe field is reset to NULL.
If multiple calls to media_entity_pipeline_start() have been made, the same number of calls to this function are required to mark the pipeline as not streaming.

void __media_entity_pipeline_stop(struct media_entity * entity)
Mark a pipeline as not streaming

Parameters

struct media_entity * entity  Starting entity
Description

**Note:**

This is the non-locking version of `media_entity_pipeline_stop()`

```c
struct media_intf_devnode *media_devnode_create(struct media_device *mdev, u32 type, u32 flags, u32 major, u32 minor)
```

creates and initializes a device node interface

**Parameters**

- `struct media_device * mdev` pointer to `media_device`
- `u32 type` type of the interface, as given by MEDIA_INTF_T_* macros as defined in the uapi/media/media.h header.
- `u32 flags` Interface flags as defined in uapi/media/media.h.
- `u32 major` Device node major number.
- `u32 minor` Device node minor number.

**Return**

If succeeded, returns a pointer to the newly allocated `media_intf_devnode` pointer.

```c
void media_devnode_remove(struct media_intf_devnode *devnode)
```

removes a device node interface

**Parameters**

- `struct media_intf_devnode * devnode` pointer to `media_intf_devnode` to be freed.

**Description**

When a device node interface is removed, all links to it are automatically removed.

```c
media_create_intf_link(struct media_entity *entity, struct media_interface *intf, u32 flags)
```

creates a link between an entity and an interface

**Parameters**

- `struct media_entity * entity` pointer to `media_entity`
- `struct media_interface * intf` pointer to `media_interface`
- `u32 flags` Link flags, as defined in include/uapi/linux/media.h.

**Description**

Valid values for flags:

- The MEDIA_LNK_FL_ENABLED flag indicates that the interface is connected to the entity hardware. That's the default value for interfaces. An interface may be disabled if the hardware is busy due to the usage of some other interface that it is currently controlling the hardware. A typical example is an hybrid TV device that handle only one type of stream on a given time. So, when the digital TV is streaming, the V4L2 interfaces won’t be enabled, as such device is not able to also stream analog TV or radio.

**Note:**

Before calling this function, `media_devnode_create()` should be called for the interface and `media_device_register_entity()` should be called for the interface that will be part of the link.

```c
void __media_remove_intf_link(struct media_link *link)
```

remove a single interface link

800 Chapter 2. Media subsystem kernel internal API
Parameters
struct media_link * link pointer to media_link.

Description

**Note:**

This is an unlocked version of media_remove_intf_link().

```c
void media_remove_intf_link(struct media_link * link)
```

remove a single interface link

Parameters
struct media_link * link pointer to media_link.

Description

**Note:**

Prefer to use this one, instead of __media_remove_intf_link().

```c
void __media_remove_intf_links(struct media_interface * intf)
```

remove all links associated with an interface

Parameters
struct media_interface * intf pointer to media_interface

Description

**Note:**

This is an unlocked version of media_remove_intf_links().

```c
void media_remove_intf_links(struct media_interface * intf)
```

remove all links associated with an interface

Parameters
struct media_interface * intf pointer to media_interface

Description

**Note:**

1. This is called automatically when an entity is unregistered via media_device_register_entity() and by media_devnode_remove().
2. Prefer to use this one, instead of __media_remove_intf_links().

2.10 CEC Kernel Support

The CEC framework provides a unified kernel interface for use with HDMI CEC hardware. It is designed to handle a multiple types of hardware (receivers, transmitters, USB dongles). The framework also gives the option to decide what to do in the kernel driver and what should be handled by userspace applications. In addition it integrates the remote control passthrough feature into the kernel’s remote control framework.
2.10.1 The CEC Protocol

The CEC protocol enables consumer electronic devices to communicate with each other through the HDMI connection. The protocol uses logical addresses in the communication. The logical address is strictly connected with the functionality provided by the device. The TV acting as the communication hub is always assigned address 0. The physical address is determined by the physical connection between devices.

The CEC framework described here is up to date with the CEC 2.0 specification. It is documented in the HDMI 1.4 specification with the new 2.0 bits documented in the HDMI 2.0 specification. But for most of the features the freely available HDMI 1.3a specification is sufficient:

2.11 The Kernel Interface

2.11.1 CEC Adapter

The struct cec_adapter represents the CEC adapter hardware. It is created by calling cec_allocate_adapter() and deleted by calling cec_delete_adapter():

```c
struct cec_adapter *cec_allocate_adapter(const struct cec_adap_ops *ops,
void *priv, const char *name, u32 caps, u8 available_las,
struct device *parent);

void cec_delete_adapter(struct cec_adapter *adap);
```

To create an adapter you need to pass the following information:

- **ops**: adapter operations which are called by the CEC framework and that you have to implement.
- **priv**: will be stored in adap->priv and can be used by the adapter ops.
- **name**: the name of the CEC adapter. Note: this name will be copied.
- **caps**: capabilities of the CEC adapter. These capabilities determine the capabilities of the hardware and which parts are to be handled by userspace and which parts are handled by kernelspace. The capabilities are returned by CEC_ADAP_G_CAPS.
- **available_las**: the number of simultaneous logical addresses that this adapter can handle. Must be 1 <= available_las <= CEC_MAX_LOG_ADDRS.
- **parent**: the parent device.

To register the /dev/cecX device node and the remote control device (if CEC_CAP_RC is set) you call:

```c
int cec_register_adapter(struct cec_adapter *adap);
```

To unregister the devices call:

```c
void cec_unregister_adapter(struct cec_adapter *adap);
```

Note: if cec_register_adapter() fails, then call cec_delete_adapter() to clean up. But if cec_register_adapter() succeeded, then only call cec_unregister_adapter() to clean up, never cec_delete_adapter(). The unregister function will delete the adapter automatically once the last user of that /dev/cecX device has closed its file handle.

2.11.2 Implementing the Low-Level CEC Adapter

The following low-level adapter operations have to be implemented in your driver:

```c
struct cec_adap_ops
```
struct cec_adap_ops
{
    /* Low-level callbacks */
    int (*adap_enable)(struct cec_adapter *adap, bool enable);
    int (*adap_monitor_all_enable)(struct cec_adapter *adap, bool enable);
    int (*adap_log_addr)(struct cec_adapter *adap, u8 logical_addr);
    int (*adap_transmit)(struct cec_adapter *adap, u8 attempts,
                        u32 signal_free_time, struct cec_msg *msg);
    void (*adap_log_status)(struct cec_adapter *adap);

    /* High-level callbacks */
    ...
};

The three low-level ops deal with various aspects of controlling the CEC adapter hardware:

To enable/disable the hardware:

int (*adap_enable)(struct cec_adapter *adap, bool enable);

This callback enables or disables the CEC hardware. Enabling the CEC hardware means powering it up
in a state where no logical addresses are claimed. This op assumes that the physical address (adap-
>phys_addr) is valid when enable is true and will not change while the CEC adapter remains enabled. The
initial state of the CEC adapter after calling cec_allocate_adapter() is disabled.

Note that adap_enable must return 0 if enable is false.

To enable/disable the 'monitor all' mode:

int (*adap_monitor_all_enable)(struct cec_adapter *adap, bool enable);

If enabled, then the adapter should be put in a mode to also monitor messages that not for us. Not all
hardware supports this and this function is only called if the CEC_CAP_MONITOR_ALL capability is set. This
callback is optional (some hardware may always be in ‘monitor all’ mode).

Note that adap_monitor_all_enable must return 0 if enable is false.

To program a new logical address:

int (*adap_log_addr)(struct cec_adapter *adap, u8 logical_addr);

If logical_addr == CEC_LOG_ADDR_INVALID then all programmed logical addresses are to be erased. Oth-
wise the given logical address should be programmed. If the maximum number of available logical
addresses is exceeded, then it should return -ENXIO. Once a logical address is programmed the CEC hard-
ware can receive directed messages to that address.

Note that adap_log_addr must return 0 if logical_addr is CEC_LOG_ADDR_INVALID.

To transmit a new message:

int (*adap_transmit)(struct cec_adapter *adap, u8 attempts,
                     u32 signal_free_time, struct cec_msg *msg);

This transmits a new message. The attempts argument is the suggested number of attempts for the
transmit.

The signal_free_time is the number of data bit periods that the adapter should wait when the line is free
before attempting to send a message. This value depends on whether this transmit is a retry, a message
from a new initiator or a new message for the same initiator. Most hardware will handle this automatically,
but in some cases this information is needed.

The CEC_FREE_TIME_TO_USEC macro can be used to convert signal_free_time to microseconds (one data
bit period is 2.4 ms).

To log the current CEC hardware status:

void (*adap_status)(struct cec_adapter *adap, struct seq_file *file);
This optional callback can be used to show the status of the CEC hardware. The status is available through debugfs: 
`cat /sys/kernel/debug/cec/cecX/status`

Your adapter driver will also have to react to events (typically interrupt driven) by calling into the framework in the following situations:

When a transmit finished (successfully or otherwise):

```c
void cec_transmit_done(struct cec_adapter *adap, u8 status, u8 arb_lost_cnt,
                       u8 nack_cnt, u8 low_drive_cnt, u8 error_cnt);
```

The status can be one of:

- **CEC_TX_STATUS_OK**: the transmit was successful.
- **CEC_TX_STATUS_ARB_LOST**: arbitration was lost: another CEC initiator took control of the CEC line and you lost the arbitration.
- **CEC_TX_STATUS_NACK**: the message was nacked (for a directed message) or acked (for a broadcast message). A retransmission is needed.
- **CEC_TX_STATUS_LOW_DRIVE**: low drive was detected on the CEC bus. This indicates that a follower detected an error on the bus and requested a retransmission.
- **CEC_TX_STATUS_ERROR**: some unspecified error occurred: this can be one of the previous two if the hardware cannot differentiate or something else entirely.
- **CEC_TX_STATUS_MAX_RETRIES**: could not transmit the message after trying multiple times. Should only be set by the driver if it has hardware support for retrying messages. If set, then the framework assumes that it doesn’t have to make another attempt to transmit the message since the hardware did that already.

The *cnt arguments are the number of error conditions that were seen. This may be 0 if no information is available. Drivers that do not support hardware retry can just set the counter corresponding to the transmit error to 1, if the hardware does support retry then either set these counters to 0 if the hardware provides no feedback of which errors occurred and how many times, or fill in the correct values as reported by the hardware.

When a CEC message was received:

```c
void cec_received_msg(struct cec_adapter *adap, struct cec_msg *msg);
```

Speaks for itself.

## 2.11.3 Implementing the High-Level CEC Adapter

The low-level operations drive the hardware, the high-level operations are CEC protocol driven. The following high-level callbacks are available:

```c
struct cec_adap_ops {
    /\* Low-level callbacks \*/
    ...
    /\* High-level CEC message callback \*/
    int (*received)(struct cec_adapter *adap, struct cec_msg *msg);
};
```

The received() callback allows the driver to optionally handle a newly received CEC message

```c
int (*received)(struct cec_adapter *adap, struct cec_msg *msg);
```

If the driver wants to process a CEC message, then it can implement this callback. If it doesn’t want to handle this message, then it should return -ENOMSG, otherwise the CEC framework assumes it processed this message and it will not no anything with it.
2.11.4 CEC framework functions

CEC Adapter drivers can call the following CEC framework functions:

```c
int cec_transmit_msg(struct cec_adapter *adap, struct cec_msg *msg, bool block);
```

Transmit a CEC message. If block is true, then wait until the message has been transmitted, otherwise just queue it and return.

```c
void cec_s_phys_addr(struct cec_adapter *adap, u16 phys_addr, bool block);
```

Change the physical address. This function will set adap->phys_addr and send an event if it has changed. If cec_s_log_addrs() has been called and the physical address has become valid, then the CEC framework will start claiming the logical addresses. If block is true, then this function won’t return until this process has finished.

When the physical address is set to a valid value the CEC adapter will be enabled (see the adap_enable op). When it is set to CEC_PHYS_ADDR_INVALID, then the CEC adapter will be disabled. If you change a valid physical address to another valid physical address, then this function will first set the address to CEC_PHYS_ADDR_INVALID before enabling the new physical address.

```c
int cec_s_log_addrs(struct cec_adapter *adap, struct cec_log_addrs *log_addrs, bool block);
```

Claim the CEC logical addresses. Should never be called if CEC_CAP_LOG_ADDRS is set. If block is true, then wait until the logical addresses have been claimed, otherwise just queue it and return. To unconfigure all logical addresses call this function with log_addrs set to NULL or with log_addrs->num_log_addrs set to 0. The block argument is ignored when unconfiguring. This function will just return if the physical address is invalid. Once the physical address becomes valid, then the framework will attempt to claim these logical addresses.

Table of Contents

3.1 Introduction

The main development site and Git repository for these drivers is https://linuxtv.org.

The DVB mailing list linux-dvb is hosted at vger. Please see http://vger.kernel.org/vger-lists.html#linux-media for details.

There are also some other old lists hosted at https://linuxtv.org/lists.php. Please check the archive https://linuxtv.org/pipermail/linux-dvb/.

The media subsystem Wiki is hosted at https://linuxtv.org/wiki/. Please check it before asking newbie questions on the list.

API documentation is documented at the Kernel. You’ll also find useful documentation at: https://linuxtv.org/docs.php.

You may also find useful material at https://linuxtv.org/downloads/.

In order to get firmware from proprietary drivers, there’s a script at the kernel tree, at scripts/get_dvb_firmware.

3.2 HOWTO: Get An Avermedia DVB-T working under Linux

February 14th 2006

Note:

This documentation is outdated. Please check at the DVB wiki at https://linuxtv.org/wiki for more updated info.

There’s a section there specific for Avermedia boards at: https://linuxtv.org/wiki/index.php/AVerMedia
3.2.1 Assumptions and Introduction

It is assumed that the reader understands the basic structure of the Linux Kernel DVB drivers and the general principles of Digital TV.

One significant difference between Digital TV and Analogue TV that the unwary (like myself) should consider is that, although the component structure of budget DVB-T cards are substantially similar to Analogue TV cards, they function in substantially different ways.

The purpose of an Analogue TV is to receive and display an Analogue Television signal. An Analogue TV signal (otherwise known as composite video) is an analogue encoding of a sequence of image frames (25 per second) rasterised using an interlacing technique. Interlacing takes two fields to represent one frame. Computers today are at their best when dealing with digital signals, not analogue signals and a composite video signal is about as far removed from a digital data stream as you can get. Therefore, an Analogue TV card for a PC has the following purpose:

- Tune the receiver to receive a broadcast signal
- demodulate the broadcast signal
- demultiplex the analogue video signal and analogue audio signal. **NOTE:** some countries employ a digital audio signal embedded within the modulated composite analogue signal - NICAM.)
- digitize the analogue video signal and make the resulting datastream available to the data bus.

The digital datastream from an Analogue TV card is generated by circuitry on the card and is often presented uncompressed. For a PAL TV signal encoded at a resolution of 768x576 24-bit color pixels over 25 frames per second - a fair amount of data is generated and must be processed by the PC before it can be displayed on the video monitor screen. Some Analogue TV cards for PCs have onboard MPEG2 encoders which permit the raw digital data stream to be presented to the PC in an encoded and compressed form - similar to the form that is used in Digital TV.

The purpose of a simple budget digital TV card (DVB-T,C or S) is to simply:

- Tune the receiver to receive a broadcast signal.
- Extract the encoded digital datastream from the broadcast signal.
- Make the encoded digital datastream (MPEG2) available to the data bus.

The significant difference between the two is that the tuner on the analogue TV card spits out an Analogue signal, whereas the tuner on the digital TV card spits out a compressed encoded digital datastream. As the signal is already digitised, it is trivial to pass this datastream to the PC databus with minimal additional processing and then extract the digital video and audio datastreams passing them to the appropriate software or hardware for decoding and viewing.

3.2.2 The Avermedia DVB-T

The Avermedia DVB-T is a budget PCI DVB card. It has 3 inputs:

- RF Tuner Input
- Composite Video Input (RCA Jack)
- SVIDEO Input (Mini-DIN)

The RF Tuner Input is the input to the tuner module of the card. The Tuner is otherwise known as the "Frontend". The Frontend of the Avermedia DVB-T is a Microtune 7202D. A timely post to the linux-dvb mailing list ascertained that the Microtune 7202D is supported by the sp887x driver which is found in the dvb-hw CVS module.

The DVB-T card is based around the BT878 chip which is a very common multimedia bridge and often found on Analogue TV cards. There is no on-board MPEG2 decoder, which means that all MPEG2 decoding must be done in software, or if you have one, on an MPEG2 hardware decoding card or chipset.
3.2.3 Getting the card going

In order to fire up the card, it is necessary to load a number of modules from the DVB driver set. Prior to this it will have been necessary to download these drivers from the linuxtv CVS server and compile them successfully.

Depending on the card’s feature set, the Device Driver API for DVB under Linux will expose some of the following device files in the /dev tree:

- /dev/dvb/adapter0/audio0
- /dev/dvb/adapter0/ca0
- /dev/dvb/adapter0/demux0
- /dev/dvb/adapter0/dvr0
- /dev/dvb/adapter0/frontend0
- /dev/dvb/adapter0/net0
- /dev/dvb/adapter0/osd0
- /dev/dvb/adapter0/video0

The primary device nodes that we are interested in (at this stage) for the Avermedia DVB-T are:

- /dev/dvb/adapter0/dvr0
- /dev/dvb/adapter0/frontend0

The dvr0 device node is used to read the MPEG2 Data Stream and the frontend0 node is used to tune the frontend tuner module.

At this stage, it has not been able to ascertain the functionality of the remaining device nodes in respect of the Avermedia DVBT. However, full functionality in respect of tuning, receiving and supplying the MPEG2 data stream is possible with the currently available versions of the driver. It may be possible that additional functionality is available from the card (i.e. viewing the additional analogue inputs that the card presents), but this has not been tested yet. If I get around to this, I’ll update the document with whatever I find.

To power up the card, load the following modules in the following order:

- modprobe bttv (normally loaded automatically)
- modprobe dvb-bt8xx (or place dvb-bt8xx in /etc/modules)

Insertion of these modules into the running kernel will activate the appropriate DVB device nodes. It is then possible to start accessing the card with utilities such as scan, tzap, dvbstream etc.

The frontend module sp887x.o, requires an external firmware. Please use the command “get_dvb_firmware sp887x” to download it. Then copy it to /usr/lib/hotplug/firmware or /lib/firmware/ (depending on configuration of firmware hotplug).

3.2.4 Receiving DVB-T in Australia

I have no experience of DVB-T in other countries other than Australia, so I will attempt to explain how it works here in Melbourne and how this affects the configuration of the DVB-T card.

The Digital Broadcasting Australia website has a Reception locator tool which provides information on transponder channels and frequencies. My local transmitter happens to be Mount Dandenong.

The frequencies broadcast by Mount Dandenong are:

Table 1. Transponder Frequencies Mount Dandenong, Vic, Aus. Broadcast Channel Frequency ABC VHF 12 226.5 MHz TEN VHF 11 219.5 MHz NINE VHF 8 191.625 MHz SEVEN VHF 6 177.5 MHz SBS UHF 29 536.5 MHz
The Scan utility has a set of compiled-in defaults for various countries and regions, but if they do not suit, or if you have a pre-compiled scan binary, you can specify a data file on the command line which contains the transponder frequencies. Here is a sample file for the above channel transponders:

```
# Data file for DVB scan program
#
# C Frequency SymbolRate FEC QAM
# S Frequency Polarisation SymbolRate FEC
# T Frequency Bandwidth FEC FEC2 QAM Mode Guard Hier
T 226500000 7MHz 2/3 NONE QAM64 8k 1/8 NONE
T 191625000 7MHz 2/3 NONE QAM64 8k 1/8 NONE
T 219500000 7MHz 2/3 NONE QAM64 8k 1/8 NONE
T 177500000 7MHz 2/3 NONE QAM64 8k 1/8 NONE
T 536500000 7MHz 2/3 NONE QAM64 8k 1/8 NONE
```

The defaults for the transponder frequency and other modulation parameters were obtained from www.dba.org.au.

When Scan runs, it will output channels.conf information for any channel’s transponders which the card’s frontend can lock onto. (i.e. any whose signal is strong enough at your antenna).

Here’s my channels.conf file for anyone who’s interested:

```

```
3.2.5 Known Limitations

At present I can say with confidence that the frontend tunes via /dev/dvb/adapter{x}/frontend0 and supplies an MPEG2 stream via /dev/dvb/adapter{x}/dvr0. I have not tested the functionality of any other part of the card yet. I will do so over time and update this document.

There are some limitations in the i2c layer due to a returned error message inconsistency. Although this generates errors in dmesg and the system logs, it does not appear to affect the ability of the frontend to function correctly.

3.2.6 Further Update

dvbstream and VideoLAN Client on windows works a treat with DVB, in fact this is currently serving as my main way of viewing DVB-T at the moment. Additionally, VLC is happily decoding HDTV signals, although the PC is dropping the odd frame here and there - I assume due to processing capability - as all the decoding is being done under windows in software.

Many thanks to Nigel Pearson for the updates to this document since the recent revision of the driver.

3.3 How to get the bt8xx cards working

Authors: Richard Walker, Jamie Honan, Michael Hunold, Manu Abraham, Uwe Bugla, Michael Krufky

Note:

This documentation is outdated. Please check at the DVB wiki at https://linuxtv.org/wiki for more updated info.

3.3.1 General information

This class of cards has a bt878a as the PCI interface, and require the bttv driver for accessing the i2c bus and the gpio pins of the bt8xx chipset. Please see Documentation/dvb/cards.txt => o Cards based on the Conexant Bt8xx PCI bridge:

Compiling kernel please enable:
1. Device drivers => Multimedia devices => Video For Linux => Enable Video for Linux API 1 (DEPRECATED)

2. Device drivers => Multimedia devices => Video For Linux => Video Capture Adapters => BT848 Video For Linux

3. Device drivers => Multimedia devices => Digital Video Broadcasting Devices => DVB for Linux DVB Core Support BT8xx based PCI Cards

Please use the following options with care as deselection of drivers which are in fact necessary may result in DVB devices that cannot be tuned due to lack of driver support: You can save RAM by deselecting every frontend module that your DVB card does not need.

First please remove the static dependency of DVB card drivers on all frontend modules for all possible card variants by enabling:

1. Device drivers => Multimedia devices => Digital Video Broadcasting Devices => DVB for Linux DVB Core Support Load and attach frontend modules as needed

If you know the frontend driver that your card needs please enable:

1. Device drivers => Multimedia devices => Digital Video Broadcasting Devices => DVB for Linux DVB Core Support Customise DVB Frontends => Customise the frontend modules to build

Then please select your card-specific frontend module.

### 3.3.2 Loading Modules

Regular case: If the bttv driver detects a bt8xx-based DVB card, all frontend and backend modules will be loaded automatically. Exceptions are: - Old TwinHan DST cards or clones with or without CA slot and not containing an Eeprom. People running udev please see Documentation/dvb/udev.txt.

In the following cases overriding the PCI type detection for dvb-bt8xx might be necessary:

#### Running TwinHan and Clones

```
$ modprobe bttv card=113
$ modprobe dst
```

Useful parameters for verbosity level and debugging the dst module:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verbose=0</td>
<td>messages are disabled</td>
</tr>
<tr>
<td>1</td>
<td>only error messages are displayed</td>
</tr>
<tr>
<td>2</td>
<td>notifications are displayed</td>
</tr>
<tr>
<td>3</td>
<td>other useful messages are displayed</td>
</tr>
<tr>
<td>4</td>
<td>debug setting</td>
</tr>
<tr>
<td>dst_addons=0</td>
<td>card is a free to air (FTA) card only</td>
</tr>
<tr>
<td>0x20</td>
<td>card has a conditional access slot for scrambled channels</td>
</tr>
</tbody>
</table>

The autodetected values are determined by the cards’ “response string”. In your logs see f. ex.: dst_get_device_id: Recognize [DSTMCI]. For bug reports please send in a complete log with verbose=4 activated. Please also see Documentation/dvb/ci.txt.

#### Running multiple cards

Examples of card ID's:

- Pinnacle PCTV Sat: 94
- Nebula Electronics Digi TV: 104
- pcHDTV HD-2000 TV: 112
Twinhan DST and clones: 113
Avermedia AverTV DVB-T 771: 123
Avermedia AverTV DVB-T 761: 124
DViCO FusionHDTV DVB-T Lite: 128
DViCO FusionHDTV 5 Lite: 135

Note:
The order of the card ID should be uprising:
Example:

$ modprobe bttv card=113 card=135

For a full list of card ID’s please see Documentation/video4linux/CARDLIST.bttv. In case of further problems please subscribe and send questions to the mailing list: linux-dvb@linuxtv.org.

Probing the cards with broken PCI subsystem ID

There are some TwinHan cards that the EEPROM has become corrupted for some reason. The cards do not have correct PCI subsystem ID. But we can force probing the cards with broken PCI subsystem ID

$ echo 109e 0878 $subvendor $subdevice > 
/sys/bus/pci/drivers/bt878/new_id

109e: PCI_VENDOR_ID_BROOKTREE
0878: PCI_DEVICE_ID_BROOKTREE_878

3.4 Hardware supported by the linuxtv.org DVB drivers

Note:
This documentation is outdated. Please check at the DVB wiki at https://linuxtv.org/wiki for more updated info.

Generally, the DVB hardware manufacturers frequently change the frontends (i.e. tuner / demodulator units) used, usually without changing the product name, revision number or specs. Some cards are also available in versions with different frontends for DVB-S/DVB-C/DVB-T. Thus the frontend drivers are listed separately.

Note:
1. There is no guarantee that every frontend driver works out of the box with every card, because of different wiring.
2. The demodulator chips can be used with a variety of tuner/PLL chips, and not all combinations are supported. Often the demodulator and tuner/PLL chip are inside a metal box for shielding, and the whole metal box has its own part number.

- Frontends drivers:
- `dvb_dummy_fe`: for testing...

**DVB-S:**
- `ves1x93`: Alps BSRV2 (ves1893 demodulator) and dbox2 (ves1993)
- `cx24110`: Conexant HM1221/HM1811 (cx24110 or cx24106 demod, cx24108 PLL)
- `grundig_29504-491`: Grundig 29504-491 (Philips TDA8083 demodulator), tsa5522 PLL
- `mt312`: Zarlink mt312 or Mitel vp310 demodulator, sl1935 or tsa5059 PLL, Technisat Sky2Pc with bios Rev. 2.3
- `stv0299`: [Alps BSRU6 (tsa5059 PLL), LG TDQB-S00x (tsa5059 PLL),] LG TDQF-S001F (sl1935 PLL), Philips SU1278 (tua6100 PLL), Philips SU1278SH (tsa5059 PLL), Samsung TBMU24112IMB, Technisat Sky2Pc with bios Rev. 2.6

**DVB-C:**
- `ves1820`: various (ves1820 demodulator, sp5659c or spXXXX PLL)
- `at76c651`: Atmel AT76c651(B) with DAT7021 PLL

**DVB-T:**
- `alps_tdlb7`: Alps TDLB7 (sp8870 demodulator, sp5659 PLL)
- `alps_tdm7`: Alps TDMB7 (cx22700 demodulator)
- `grundig_29504-401`: Grundig 29504-401 (LSI L64781 demodulator), tsa5060 PLL
- `tda1004x`: Philips tda10045h (td1344 or tdm1316l PLL)
- `nxt6000`: Alps TDEME7 (MITEL SP5659 PLL), Alps TEDD4 (TI ALP510 PLL), Comtech DVBT-6k07 (SP5730 PLL), (NxtWave Communications NXT6000 demodulator)
- `sp887x`: Microtune 7202D
- `dib3000mb`: DiBcom 3000-MB demodulator

**DVB-S/C/T:**
- `dst`: TwinHan DST Frontend

**ATSC:**
- `nxt200x`: Nxtwave NXT2002 & NXT2004
- `or51211`: or51211 based (pcHDTV HD2000 card)
- `or51132`: or51132 based (pcHDTV HD3000 card)
- `bcm3510`: Broadcom BCM3510
- `lgdt330x`: LG Electronics DT3302 & DT3303

* Cards based on the Phillips saa7146 multimedia PCI bridge chip:
  - TI AV7110 based cards (i.e. with hardware MPEG decoder): - Siemens/Technotrend/Hauppauge PCI DVB card revision 1.1, 1.3, 1.5, 1.6, 2.1 (aka Hauppauge Nexus)
  - “budget” cards (i.e. without hardware MPEG decoder): - Technotrend Budget / Hauppauge WinTV-Nova PCI Cards - SATELCO Multimedia PCI - KNC1 DVB-S, Typhoon DVB-S, Terratec Cinergy 1200 DVB-S (no CI support) - Typhoon DVB-S budget - Fujitsu-Siemens Activy DVB-S budget card

* Cards based on the B2C2 Inc. FlexCopII/IIb/III:
  - Technisat SkyStar2 PCI DVB card revision 2.3, 2.6B, 2.6C

* Cards based on the Conexant Bt8xx PCI bridge:
  - Pinnacle PCTV Sat DVB
  - Nebula Electronics DigiTV

Note:

This documentation is outdated.

This document describes the usage of the high level CI API as in accordance to the Linux DVB API. This is not a documentation for the existing low level CI API.

Note:

For the Twinhan/Twinhan clones, the dst_ca module handles the CI hardware handling. This module is loaded automatically if a CI (Common Interface, that holds the CAM (Conditional Access Module) is detected.

3.5 Digital TV Conditional Access Interface (CI API)

3.5.1 ca_zap

An userspace application, like ca_zap is required to handle encrypted MPEG-TS streams.

The ca_zap userland application is in charge of sending the descrambling related information to the Conditional Access Module (CAM).

This application requires the following to function properly as of now.

1. Tune to a valid channel, with szap.
   
   eg: $ szap -c channels.conf -r “TMC” -x

2. a channels.conf containing a valid PMT PID
   
       here 278 is a valid PMT PID. the rest of the values are the same ones that szap uses.

3. after running a szap, you have to run ca_zap, for the descrambler to function,
   
   eg: $ ca_zap channels.conf “TMC”

4. Hopefully enjoy your favourite subscribed channel as you do with a FTA card.
3.5.2 Cards that fall in this category

At present the cards that fall in this category are the Twinhan and its clones, these cards are available as VVMER, Tomato, Hercules, Orange and so on.

3.5.3 CI modules that are supported

The CI module support is largely dependent upon the firmware on the cards Some cards do support almost all of the available CI modules. There is nothing much that can be done in order to make additional CI modules working with these cards.

Modules that have been tested by this driver at present are

1. Irdeto 1 and 2 from SCM
2. Viaccess from SCM
3. Dragoncam

3.5.4 The High level CI API

For the programmer

With the High Level CI approach any new card with almost any random architecture can be implemented with this style, the definitions inside the switch statement can be easily adapted for any card, thereby eliminating the need for any additional ioctls.

The disadvantage is that the driver/hardware has to manage the rest. For the application programmer it would be as simple as sending/receiving an array to/from the CI ioctls as defined in the Linux DVB API. No changes have been made in the API to accommodate this feature.

3.5.5 Why the need for another CI interface?

This is one of the most commonly asked question. Well a nice question. Strictly speaking this is not a new interface.

The CI interface is defined in the DVB API in ca.h as:

```c
typedef struct ca_slot_info {
    int num; /* slot number */
    int type; /* CA interface this slot supports */
#define CA_CI 1 /* CI high level interface */
#define CA_CI_LINK 2 /* CI link layer level interface */
#define CA_CI_PHYS 4 /* CI physical layer level interface */
#define CA_DESCR 8 /* built-in descrambler */
#define CA_SC 128 /* simple smart card interface */
    unsigned int flags;
#define CA_CI_MODULE_PRESENT 1 /* module (or card) inserted */
#define CA_CI_MODULE_READY 2
} ca_slot_info_t;
```
This CI interface follows the CI high level interface, which is not implemented by most applications. Hence this area is revisited.

This CI interface is quite different in the case that it tries to accommodate all other CI based devices, that fall into the other categories.

This means that this CI interface handles the EN50221 style tags in the Application layer only and no session management is taken care of by the application. The driver/hardware will take care of all that.

This interface is purely an EN50221 interface exchanging APDU’s. This means that no session management, link layer or a transport layer do exist in this case in the application to driver communication. It is as simple as that. The driver/hardware has to take care of that.

With this High Level CI interface, the interface can be defined with the regular ioctls.

All these ioctls are also valid for the High level CI interface

```c
#define CA_RESET _IO('o', 128) #define CA_GET_CAP _IOR('o', 129, ca_caps_t) #define CA_GET_SLOT_INFO _IOR('o', 130, ca_slot_info_t) #define CA_GET_DESCR_INFO _IOR('o', 131, ca_descr_info_t) #define CA_GET_MSG _IOR('o', 132, ca_msg_t) #define CA_SEND_MSG _IOW('o', 133, ca_msg_t) #define CA_SET_DESCR _IOW('o', 134, ca_descr_t) #define CA_SET_PID _IOW('o', 135, ca_pid_t)
```

On querying the device, the device yields information thus:

```
CA_GET_SLOT_INFO ---------------------------------------
Command = [info]
APP: Number=[1]
APP: Type=[1]
APP: flags=[1]
APP: CI High level interface
APP: CA/CI Module Present

CA_GET_CAP ---------------------------------------------
Command = [caps]
APP: Slots=[1]
APP: Type=[1]
APP: Descrambler keys=[16]
APP: Type=[1]

CA_SEND_MSG --------------------------------------------
Descriptors(Program Level)=[ 09 06 06 04 05 50 ff f1]
Found CA descriptor @ program level

(20) ES type=[2] ES pid=[201] ES length =[0 (0x0)]
(25) ES type=[4] ES pid=[301] ES length =[0 (0x0)]
ca message length is 25 (0x19) bytes
EN50221 CA MSG=[ 9f 80 32 19 03 01 2d d1 f0 08 01 09 06 04 05 50 ff f1 02 e0 c9 00 00 04 e1 w 2d 00 00 ]
```

Not all ioctl’s are implemented in the driver from the API, the other features of the hardware that cannot be implemented by the API are achieved using the CA_GET_MSG and CA_SEND_MSG ioctls. An EN50221 style wrapper is used to exchange the data to maintain compatibility with other hardware.

```c
/* a message to/from a CI-CAM */
typedef struct ca_msg {
    unsigned int index;
    unsigned int type;
    unsigned int length;
    unsigned char msg[256];
} ca_msg_t;
```
The flow of data can be described thus,

```
App (User)  -----
    parse
    v
en50221 APDU (package)
    v
| | | High Level CI driver
| | |
| v |
| en50221 APDU (unpackage) |
| | |
| v |
sanity checks
| v |
do (H/W dep)
-------------------
| Hardware
| v
```

The High Level CI interface uses the EN50221 DVB standard, following a standard ensures futureproofness.

### 3.6 Idea behind the dvb-usb-framework

**Note:**

1. *This documentation is outdated. Please check at the DVB wiki at [https://linuxtv.org/wiki](https://linuxtv.org/wiki) for more updated info.*
2. **deprecated:** Newer DVB USB drivers should use the dvb-usb-v2 framework.

In March 2005 I got the new Twinhan USB2.0 DVB-T device. They provided specs and a firmware.

Quite keen I wanted to put the driver (with some quirks of course) into dibusb. After reading some specs and doing some USB snooping, it realized, that the dibusb-driver would be a complete mess afterwards. So I decided to do it in a different way: With the help of a dvb-usb-framework.

The framework provides generic functions (mostly kernel API calls), such as:

- Transport Stream URB handling in conjunction with dvb-demux-feed-control (bulk and isoc are supported)
- registering the device for the DVB-API
- registering an I2C-adapter if applicable
- remote-control/input-device handling
- firmware requesting and loading (currently just for the Cypress USB controllers)
- other functions/methods which can be shared by several drivers (such as functions for bulk-control-commands)
- TODO: a I2C-chunker. It creates device-specific chunks of register-accesses depending on length of a register and the number of values that can be multi-written and multi-read.
The source code of the particular DVB USB devices does just the communication with the device via the bus. The connection between the DVB-API-functionality is done via callbacks, assigned in a static device-description (struct dvb_usb_device) each device-driver has to have.

For an example have a look in drivers/media/usb/dvb-usb/vp7045*.

Objective is to migrate all the usb-devices (dibusb, cinergyT2, maybe the ttusb; flexcop-usb already benefits from the generic flexcop-device) to use the dvb-usb-lib.

TODO: dynamic enabling and disabling of the pid-filter in regard to number of feeds requested.

### 3.6.1 Supported devices

See the LinuxTV DVB Wiki at [https://linuxtv.org](https://linuxtv.org) for a complete list of cards/drivers/firmwares: [https://linuxtv.org/wiki/index.php/DVB_USB](https://linuxtv.org/wiki/index.php/DVB_USB)

0. History & News:

2005-06-30
- added support for WideView WT-220U (Thanks to Steve Chang)

2005-05-30
- added basic isochronous support to the dvb-usb-framework
  - **added support for Conexant Hybrid reference design and Nebula** DigiTV USB

2005-04-17
- all dibusb devices ported to make use of the dvb-usb-framework

2005-04-02
- re-enabled and improved remote control code.

2005-03-31
- ported the Yakumo/Hama/Typhoon DVB-T USB2.0 device to dvb-usb.

2005-03-30
- first commit of the dvb-usb-module based on the dibusb-source. First device is a new driver for the TwinhanDTV Alpha / MagicBox II USB2.0-only DVB-T device.
  - (change from dvb-dibusb to dvb-usb)

2005-03-28
- added support for the AVerMedia AverTV DVB-T USB2.0 device (Thanks to Glen Harris and Jiun-Kuei Jung, AVerMedia)

2005-03-14
- added support for the Typhoon/Yakumo/HAMA DVB-T mobile USB2.0

2005-02-11
- added support for the KWorld/ADSTech Instant DVB-T USB2.0. Thanks a lot to Joachim von Caron

2005-02-02 - added support for the Hauppauge Win-TV Nova-T USB2

2005-01-31 - distorted streaming is gone for USB1.1 devices

2005-01-13
- moved the mirrored pid_filter_table back to dvb-dibusb first almost working version for HanffTek UMT-010 found out, that Yakumo/HAMA/Typhoon are predecessors of the HanffTek UMT-010

2005-01-10
• refactoring completed, now everything is very delightful
• tuner quirks for some weird devices (Artec T1 AN2235 device has sometimes a Panasonic Tuner assembled). Tunerprobing implemented. Thanks a lot to Gunnar Wittich.

2004-12-29
• after several days of struggling around bug of no returning URBS fixed.

2004-12-26
• refactored the dibusb-driver, splitted into separate files
• i2c-probing enabled

2004-12-06
• possibility for demod i2c-address probing
• new usb IDs (Compro, Artec)

2004-11-23
• merged changes from DiB3000MC_ver2.1
• revised the debugging
• possibility to deliver the complete TS for USB2.0

2004-11-21
• first working version of the dib3000mc/p frontend driver.

2004-11-12
• added additional remote control keys. Thanks to Uwe Hanke.

2004-11-07
• added remote control support. Thanks to David Matthews.

2004-11-05
• added support for a new devices (Grandtec/Avermedia/Artec)
• merged my changes (for dib3000mb/dibusb) to the FE_REFACTORING, because it became HEAD
• moved transfer control (pid filter, fifo control) from usb driver to frontend, it seems better settled there (added xfer_ops-struct)
• created a common files for frontends (mc/p/mb)

2004-09-28
• added support for a new device (Unknown, vendor ID is Hyper-Paltek)

2004-09-20
• added support for a new device (Compro DVB-U2000), thanks to Amaury Demol for reporting
• changed usb TS transfer method (several urbs, stopping transfer before setting a new pid)

2004-09-13
• added support for a new device (Artec T1 USB TVBOX), thanks to Christian Motschke for reporting

2004-09-05
• released the dibusb device and dib3000mb-frontend driver (old news for vp7041.c)

2004-07-15
• found out, by accident, that the device has a TUA6010XS for PLL
2004-07-12
• figured out, that the driver should also work with the CTS Portable (Chinese Television System)

2004-07-08
• firmware-extraction-2.422-problem solved, driver is now working properly with firmware extracted from 2.422
• #if for 2.6.4 (dvb), compile issue
• changed firmware handling, see vp7041.txt sec 1.1

2004-07-02
• some tuner modifications, v0.1, cleanups, first public

2004-06-28
• now using the dvb_dmx_swfilter_packets, everything runs fine now

2004-06-27
• able to watch and switching channels (pre-alpha)
• no section filtering yet

2004-06-06
• first TS received, but kernel oops :/

2004-05-14
• firmware loader is working

2004-05-11
• start writing the driver

### 3.6.2 How to use?

**Firmware**

Most of the USB drivers need to download a firmware to the device before start working.

Have a look at the Wikipage for the DVB-USB-drivers to find out, which firmware you need for your device:

https://linuxtv.org/wiki/index.php/DVB_USB

**Compiling**

Since the driver is in the linux kernel, activating the driver in your favorite config-environment should sufficient. I recommend to compile the driver as module. Hotplug does the rest.

If you use dvb-kernel enter the build-2.6 directory run `make` and `insmod.sh load` afterwards.

**Loading the drivers**

Hotplug is able to load the driver, when it is needed (because you plugged in the device).

If you want to enable debug output, you have to load the driver manually and from within the dvb-kernel cvs repository.

first have a look, which debug level are available:
# modinfo dvb-usb
# modinfo dvb-usb-vp7045
etc.

modprobe dvb-usb debug=<level>
modprobe dvb-usb-vp7045 debug=<level>
etc.

should do the trick.

When the driver is loaded successfully, the firmware file was in the right place and the device is connected, the “Power”-LED should be turned on.

At this point you should be able to start a dvb-capable application. I’m use (t|s)zap, mplayer and dvbscan to test the basics. VDR-xine provides the long-term test scenario.

### 3.6.3 Known problems and bugs

- Don’t remove the USB device while running an DVB application, your system will go crazy or die most likely.

Adding support for devices

TODO

USB1.1 Bandwidth limitation

A lot of the currently supported devices are USB1.1 and thus they have a maximum bandwidth of about 5-6 MBit/s when connected to a USB2.0 hub. This is not enough for receiving the complete transport stream of a DVB-T channel (which is about 16 MBit/s). Normally this is not a problem, if you only want to watch TV (this does not apply for HDTV), but watching a channel while recording another channel on the same frequency simply does not work very well. This applies to all USB1.1 DVB-T devices, not just the dvb-usb-devices.

The bug, where the TS is distorted by a heavy usage of the device is gone definitely. All dvb-usb-devices I was using (Twinhan, Kworld, DiBcom) are working like charm now with VDR. Sometimes I even was able to record a channel and watch another one.

Comments

Patches, comments and suggestions are very very welcome.

#### 3.6.4 3. Acknowledgements

Amaury Demol (Amaury.Demol@parrot.com) and Francois Kanounnikoff from DiBcom for providing specs, code and help, on which the dvb-dibusb, dib3000mb and dib3000mc are based.

David Matthews for identifying a new device type (Artec T1 with AN2235) and for extending dibusb with remote control event handling. Thank you.

Alex Woods for frequently answering question about usb and dvb stuff, a big thank you.

Bernd Wagner for helping with huge bug reports and discussions.

Gunnar Wittich and Joachim von Caron for their trust for providing root-shells on their machines to implement support for new devices.

3.6. Idea behind the dvb-usb-framework
Allan Third and Michael Hutchinson for their help to write the Nebula digitv-driver.

Glen Harris for bringing up, that there is a new dibusb-device and Jiun-Kuei Jung from AVerMedia who kindly provided a special firmware to get the device up and running in Linux.

Jennifer Chen, Jeff and Jack from Twinhan for kindly supporting by writing the vp7045-driver.

Steve Chang from WideView for providing information for new devices and firmware files.

Michael Paxton for submitting remote control keymaps.

Some guys on the linux-dvb mailing list for encouraging me.

Peter Schilde who peter.schildmann-nospam-at-web.de for his user-level firmware loader, which saves a lot of time (when writing the vp7041 driver)

Ulf Hermenau for helping me out with traditional chinese.

André Smoktun and Christian Frömmel for supporting me with hardware and listening to my problems very patiently.

3.7 FAQ

**Note:**

This documentation is outdated. Please check at the DVB wiki at https://linuxtv.org/wiki for more updated info.

Some very frequently asked questions about linuxtv-dvb

1. The signal seems to die a few seconds after tuning.

   It’s not a bug, it’s a feature. Because the frontends have significant power requirements (and hence get very hot), they are powered down if they are unused (i.e. if the frontend device is closed). The dvb-core.o module parameter “dvb_shutdown_timeout” allow you to change the timeout (default 5 seconds). Setting the timeout to 0 disables the timeout feature.

2. How can I watch TV?

   The driver distribution includes some simple utilities which are mainly intended for testing and to demonstrate how the DVB API works.

   Depending on whether you have a DVB-S, DVB-C or DVB-T card, use apps/szap/szap, czap or tzap. You must supply a channel list in ~/.[sct]zap/channels.conf. If you are lucky you can just copy one of the supplied channel lists, or you can create a new one by running apps/scan/scan. If you run scan on an unknown network you might have to supply some start data in apps/scan/initial.h.

   If you have a card with a built-in hardware MPEG-decoder the drivers create a video4linux device (/dev/v4l/video0) which you can use to watch TV with any v4l application. xawtv is known to work. Note that you cannot change channels with xawtv, you have to zap using [sct]zap. If you want a nice application for TV watching and record/playback, have a look at VDR.

   If your card does not have a hardware MPEG decoder you need a software MPEG decoder. Mplayer or xine are known to work. Newsflash: MythTV also has DVB support now. Note: Only very recent versions of Mplayer and xine can decode. MPEG2 transport streams (TS) directly. Then, run ‘[sct]zap channelname -r’ in one xterm, and keep it running, and start ‘mplayer - < /dev/dvb/adapter0/dvr0’ or ‘xine stdin://mpeg2 < /dev/dvb/adapter0/dvr0’ in a second xterm. That’s all far from perfect, but it seems no one has written a nice DVB application which includes a builtin software MPEG decoder yet.
Newsflash: Newest xine directly supports DVB. Just copy your channels.conf to ~/.xine and start `xine dvb://`, or select the DVB button in the xine GUI. Channel switching works using the numpad pgup/pgdown (NP9 / NP3) keys to scroll through the channel osd menu and pressing numpad-enter to switch to the selected channel.

Note: Older versions of xine and mplayer understand MPEG program streams (PS) only, and can be used in conjunction with the ts2ps tool from the Metzler Brother’s dvb-mpegtools package.

3. Which other DVB applications exist?

http://www.cadsoft.de/people/kls/vdr/ Klaus Schmidinger’s Video Disk Recorder
http://www.metzlerbros.org/dvb/ Metzler Bros. DVB development; alternate drivers and DVB utilities, include dvb-mpegtools and tuxzap.
http://sourceforge.net/projects/dvbtools/ Dave Chapman’s dvbtools package, including dbvstream and dvbttune
http://www.linuxdvb.tv/ Henning Holtschneider’s site with many interesting links and docs
http://www.dbox2.info/ LinuxDVB on the dBox2
http://www.tuxbox.org/ and http://cvs.tuxbox.org/ the TuxBox CVS many interesting DVB applications and the dBox2 DVB source
https://linuxtv.org/downloads DVB Swiss Army Knife library and utilities
http://www.nenie.org/misc/mpsys/ MPSYS: a MPEG2 system library and tools
http://mplayerhq.hu/ mplayer
http://xine.sourceforge.net/ and http://xinehq.de/ xine
http://www.mythtv.org/ MythTV - analog TV PVR, but now with DVB support, too (with software MPEG decode)
http://dvbsnoop.sourceforge.net/ DVB sniffer program to monitor, analyze, debug, dump or view dvb/mpeg/dsm-cc/mhp stream information (TS, PES, SECTION)

4. Can’t get a signal tuned correctly

If you are using a Technotrend/Hauppauge DVB-C card without analog module, you might have to use module parameter adac=-1 (dvb-ttpci.o).

5. The dvb_net device doesn’t give me any packets at all

Run tcpdump on the dvb0_0 interface. This sets the interface into promiscuous mode so it accepts any packets from the PID you have configured with the dvbnet utility. Check if there are any packets with the IP addr and MAC addr you have configured with ifconfig.

If tcpdump doesn’t give you any output, check the statistics which ifconfig outputs. (Note: If the MAC address is wrong, dvb_net won’t get any input; thus you have to run tcpdump before checking the statistics.) If there are no packets at all then maybe the PID is wrong. If there are error packets, then either the PID is wrong or the stream does not conform to the MPE standard (EN 301 192, http://www.etsi.org/). You can use e.g. dvbsnoop for debugging.

6. The dvb_net device doesn’t give me any multicast packets

Check your routes if they include the multicast address range. Additionally make sure that “source validation by reversed path lookup” is disabled:

```
$ echo 0 > /proc/sys/net/ipv4/conf/dvb0/rp_filter
```

7. What the hell are all those modules that need to be loaded?

For a dvb-ttpci av7110 based full-featured card the following modules are loaded:
• videodev: Video4Linux core module. This is the base module that gives you access to the “analog” tv picture of the av7110 mpeg2 decoder.
• v4l2-common: common functions for Video4Linux-2 drivers
• v4l1-compat: backward compatibility layer for Video4Linux-1 legacy applications
• dvb-core: DVB core module. This provides you with the /dev/dvb/adapter entries
• saa7146: SAA7146 core driver. This is need to access any SAA7146 based card in your system.
• saa7146_vv: SAA7146 video and vbi functions. These are only needed for full-featured cards.
• videobuf-dma-sg: capture helper module for the saa7146_vv driver. This one is responsible to handle capture buffers.
• dvb-ttpci: The main driver for AV7110 based, full-featured DVB-S/C/T cards

3.8 Firmware files for lmedm04 cards

To extract firmware for the DM04/QQBOX you need to copy the following file(s) to this directory.

3.8.1 For DM04+/QQBOX LME2510C (Sharp 7395 Tuner)

The Sharp 7395 driver can be found in windows/system32/drivers
US2A0D.sys (dated 17 Mar 2009)
and run:

    scripts/get_dvb_firmware lme2510c_s7395

will produce dvb-usb-lme2510c-s7395.fw
An alternative but older firmware can be found on the driver disk DVB-S_EN_3.5A in BDADriver/driver
LMEBDA_DVBS7395C.sys (dated 18 Jan 2008)
and run:

    ./get_dvb_firmware lme2510c_s7395_old

will produce dvb-usb-lme2510c-s7395.fw
The LG firmware can be found on the driver disk DM04+_5.1A[LG] in BDADriver/driver

3.8.2 For DM04 LME2510 (LG Tuner)

LMEBDA_DVBS.sys (dated 13 Nov 2007)
and run:

    ./get_dvb_firmware lme2510_lg

will produce dvb-usb-lme2510-lg.fw
Other LG firmware can be extracted manually from US280D.sys only found in windows/system32/drivers
dd if=US280D.sys ibs=1 skip=42360 count=3924 of=dvb-usb-lme2510-lg.fw
3.8.3 For DM04 LME2510C (LG Tuner)

```bash
dd if=US280D.sys ibs=1 skip=35200 count=3850 of=dvb-usb-lme2510c-lg.fw
```

The Sharp 0194 tuner driver can be found in windows/system32/drivers
US290D.sys (dated 09 Apr 2009)

3.8.4 For LME2510

```bash
dd if=US290D.sys ibs=1 skip=36856 count=3976 of=dvb-usb-lme2510-s0194.fw
```

3.8.5 For LME2510C

```bash
dd if=US290D.sys ibs=1 skip=33152 count=3697 of=dvb-usb-lme2510c-s0194.fw
```

The m88rs2000 tuner driver can be found in windows/system32/drivers
US2B0D.sys (dated 29 Jun 2010)

```bash
dd if=US2B0D.sys ibs=1 skip=34432 count=3871 of=dvb-usb-lme2510c-rs2000.fw
```

We need to modify id of rs2000 firmware or it will warm boot id 3344:1120.

```bash
echo -ne \xF0\x22 | dd conv=notrunc bs=1 count=2 seek=266 of=dvb-usb-lme2510c-rs2000.fw
```

Copy the firmware file(s) to /lib/firmware

3.9 Opera firmware

Author: Marco Gittler <g.marco@freenet.de>

To extract the firmware for the Opera DVB-S1 USB-Box you need to copy the files:
2830SCap2.sys 2830SLoad2.sys from the windriver disk into this directory.
Then run:

```bash
scripts/get_dvb_firmware opera1
```

and after that you have 2 files:
dvb-usb-opera-01.fw dvd-usb-opera1-fpga-01.fw
in here.
Copy them into /lib/firmware/.
After that the driver can load the firmware (if you have enabled firmware loading in kernel config and have hotplug running).
3.10 How to set up the Technisat/B2C2 Flexcop devices

**Note:**

This documentation is outdated.

Author: Uwe Bugla <uwe.bugla@gmx.de> August 2009

3.10.1 Find out what device you have

Important Notice: The driver does NOT support Technisat USB 2 devices!

First start your linux box with a shipped kernel:

```bash
lspci -vvv for a PCI device (lsusb -vvv for an USB device) will show you for example:
02:0b.0 Network controller: Techsan Electronics Co Ltd B2C2 FlexCopII DVB chip /
Technisat SkyStar2 DVB card (rev 02)
dmesg | grep frontend may show you for example:
DVB: registering frontend 0 (Conexant CX24123/CX24109)...
```

3.10.2 Kernel compilation:

If the Flexcop / Technisat is the only DVB / TV / Radio device in your box get rid of unnecessary modules and check this one:

Multimedia support => Customise analog and hybrid tuner modules to build

In this directory uncheck every driver which is activated there (except Simple tuner support for ATSC 3rd generation only -> see case 9 please).

Then please activate:

- **Main module part:**
  
  Multimedia support => DVB/ATSC adapters => Technisat/B2C2 FlexcopII(b) and Flex-CopIII adapters
  
  1. => Technisat/B2C2 Air/Sky/Cable2PC PCI (PCI card) or
  2. => Technisat/B2C2 Air/Sky/Cable2PC USB (USB 1.1 adapter) and for troubleshooting purposes:
  3. => Enable debug for the B2C2 FlexCop drivers

- **Frontend / Tuner / Demodulator module part:**
  
  Multimedia support => DVB/ATSC adapters => Customise the frontend modules to build DVB frontends =>
  
  - SkyStar DVB-S Revision 2.3:
    1. => Zarlink VP310/MT312/ZL10313 based
    2. => Generic I2C PLL based tuners
  - SkyStar DVB-S Revision 2.6:
    1. => ST STV0299 based
    2. => Generic I2C PLL based tuners
  - SkyStar DVB-S Revision 2.7:
1. => Samsung S5H1420 based
2. => Integrant ITD1000 Zero IF tuner for DVB-S/DSS
3. => ISL6421 SEC controller

- SkyStar DVB-S Revision 2.8:
  1. => Conexant CX24123 based
  2. => Conexant CX24113/CX24128 tuner for DVB-S/DSS
  3. => ISL6421 SEC controller

- AirStar DVB-T card:
  1. => Zarlink MT352 based
  2. => Generic I2C PLL based tuners

- CableStar DVB-C card:
  1. => ST STV0297 based
  2. => Generic I2C PLL based tuners

- AirStar ATSC card 1st generation:
  1. => Broadcom BCM3510

- AirStar ATSC card 2nd generation:
  1. => NxtWave Communications NXT2002/NXT2004 based
  2. => Generic I2C PLL based tuners

- AirStar ATSC card 3rd generation:
  1. => LG Electronics LGDT3302/LGDT3303 based
  2. Multimedia support => Customise analog and hybrid tuner modules to build => Simple tuner support

3.11 TechnoTrend/Hauppauge DEC USB Driver

3.11.1 Driver Status

Supported:
- DEC2000-t
- DEC2450-t
- DEC3000-s
- Video Streaming
- Audio Streaming
- Section Filters
- Channel Zapping
- Hotplug firmware loader

To Do:
- Tuner status information
- DVB network interface
- Streaming video PC->DEC
• Conax support for 2450-t

### 3.11.2 Getting the Firmware

To download the firmware, use the following commands:

```
scripts/get_dvb_firmware dec2000t
scripts/get_dvb_firmware dec2540t
scripts/get_dvb_firmware dec3000s
```

### 3.11.3 Hotplug Firmware Loading

Since 2.6 kernels, the firmware is loaded at the point that the driver module is loaded.

Copy the three files downloaded above into the `/usr/lib/hotplug/firmware` or `/lib/firmware` directory (depending on configuration of firmware hotplug).

### 3.12 UDEV rules for DVB

**Note:**

1. This documentation is outdated. Udev on modern distributions auto-detect the DVB devices.
2. **TODO:** change this document to explain how to make DVB devices persistent, as, when a machine has multiple devices, they may be detected on different orders, which could cause apps that relies on the device numbers to fail.

The DVB subsystem currently registers to the sysfs subsystem using the “class_simple” interface. This means that only the basic information like module loading parameters are presented through sysfs. Other things that might be interesting are currently **not** available.

Nevertheless it’s now possible to add proper udev rules so that the DVB device nodes are created automatically.

We assume that you have udev already up and running and that have been creating the DVB device nodes manually up to now due to the missing sysfs support.

0. Don’t forget to disable your current method of creating the device nodes manually.

1. Unfortunately, you’ll need a helper script to transform the kernel sysfs device name into the well known `dvb/adapter/device` naming scheme. The script should be called “`dvb.sh`” and should be placed into a script dir where udev can execute it, most likely `/etc/udev/scripts/`

So, create a new file `/etc/udev/scripts/dvb.sh` and add the following:

```bash
#!/bin/sh
/bin/echo $1 | /bin/sed -e 's,dvb\([0-9]\)\([^0-9]*\)\([0-9]\),dvb/adapter\1/\2/\3,'
```

Don’t forget to make the script executable with “`chmod`”.

1. You need to create a proper udev rule that will create the device nodes like you know them. All real distributions out there scan the `/etc/udev/rules.d` directory for rule files. The main udev configuration file `/etc/udev/udev.conf` will tell you the directory where the rules are, most likely it’s `/etc/udev/rules.d/`

Create a new rule file in that directory called “`dvb.rule`” and add the following line:

```
KERNEL="dvb*", PROGRAM="/etc/udev/scripts/dvb.sh %k", NAME="%c"
```
If you want more control over the device nodes (for example a special group membership) have a look at “man udev”.

For every device that registers to the sysfs subsystem with a “dvb” prefix, the helper script /etc/udev/scripts/dvb.sh is invoked, which will then create the proper device node in your /dev/ directory.

### 3.13 Contributors

**Note:**

*This documentation is outdated. There are several other DVB contributors that aren’t listed below.*

Thanks go to the following people for patches and contributions:

- Michael Hunold <m.hunold@gmx.de>
  - for the initial saa7146 driver and its recent overhaul
- Christian Theiss
  - for his work on the initial Linux DVB driver
- Marcus Metzler <mocm@metzlerbros.de> and Ralph Metzler <rjkm@metzlerbros.de>
  - for their continuing work on the DVB driver
- Michael Holzt <kju@debian.org>
  - for his contributions to the dvb-net driver
- Diego Picciani <d.picciani@novacomp.it>
  - for CyberLogin for Linux which allows logging onto EON (in case you are wondering where CyberLogin is, EON changed its login procedure and CyberLogin is no longer used.)
- Martin Schaller <martin@smurf.franken.de>
  - for patching the cable card decoder driver
- Klaus Schmidinger <Klaus.Schmidinger@cadsoft.de>
  - for various fixes regarding tuning, OSD and CI stuff and his work on VDR
- Steve Brown <sbrown@cortland.com>
  - for his AFC kernel thread
- Christoph Martin <martin@uni-mainz.de>
  - for his LIRC infrared handler
- Andreas Oberritter <obi@linuxtv.org>, Dennis Noermann <dennis.noermann@noernet.de>, Felix Domke <tmbinc@elitedvb.net>, Florian Schirmer <jolt@tuxbox.org>, Ronny Strutz <3des@elitedvb.de>, Wolfram Joost <dbox2@frokaschwei.de> and all the other dbox2 people
  - for many bugfixes in the generic DVB Core, frontend drivers and their work on the dbox2 port of the DVB driver
- Oliver Endriss <o.endriss@gmx.de>
  - for many bugfixes
- Andrew de Quincey <adq_dvb@lidskialf.net>
  - for the tda1004x frontend driver, and various bugfixes
- Peter Schildmann <peter.schildmann@web.de>
- for the driver for the Technisat SkyStar2 PCI DVB card

- Vadim Catana <skystar@moldova.cc>, Roberto Ragusa <r.ragusa@libero.it> and Augusto Cardoso <augusto@carhil.net>
  - for all the work for the FlexCopII chipset by B2C2,Inc.

- Davor Emard <emard@softhome.net>
  - for his work on the budget drivers, the demux code, the module unloading problems, ...

- Hans-Frieder Vogt <hfvogt@arcor.de>
  - for his work on calculating and checking the crc’s for the TechnoTrend/Hauppauge DEC driver firmware

- Michael Dreher <michael@5dot1.de> and Andreas ‘randy’ Weinberger
  - for the support of the Fujitsu-Siemens Activy budget DVB-S

- Kenneth Aafløy <ke-aa@frisurf.no>
  - for adding support for Typhoon DVB-S budget card

- Ernst Peinlich <e.peinlich@inode.at>
  - for tuning/DiSEqC support for the DEC 3000-s

- Peter Beutner <p.beutner@gmx.net>
  - for the IR code for the ttusb-dec driver

- Wilson Michaels <wilsonmichaels@earthlink.net>
  - for the lgdt330x frontend driver, and various bugfixes

- Michael Krufky <mkrufky@linuxtv.org>
  - for maintaining v4l/dvb inter-tree dependencies

- Taylor Jacob <rtjacob@earthlink.net>
  - for the nxt2002 frontend driver

- Jean-Francois Thibert <jeanfrancois@sagetv.com>
  - for the nxt2004 frontend driver

- Kirk Lapray <kirk.lapray@gmail.com>
  - for the or51211 and or51132 frontend drivers, and for merging the nxt2002 and nxt2004 modules into a single nxt200x frontend driver.

(If you think you should be in this list, but you are not, drop a line to the DVB mailing list)

Table of Contents

4.1 Guidelines for Linux4Linux pixel format 4CCs

Guidelines for Video4Linux 4CC codes defined using v4l2_fourcc() are specified in this document. First of the characters defines the nature of the pixel format, compression and colour space. The interpretation of the other three characters depends on the first one.

Existing 4CCs may not obey these guidelines.

4.1.1 Raw bayer

The following first characters are used by raw bayer formats:

- B: raw bayer, uncompressed
- b: raw bayer, DPCM compressed
- a: A-law compressed
- u: u-law compressed

2nd character: pixel order

- B: BGGR
- G: GBRG
- g: GRBG
- R: RGGB

3rd character: uncompressed bits-per-pixel 0–9, A–

4th character: compressed bits-per-pixel 0–9, A–
4.2 Infrared remote control support in video4linux drivers

Authors: Gerd Hoffmann, Mauro Carvalho Chehab

4.2.1 Basics

Most analog and digital TV boards support remote controllers. Several of them have a microprocessor that receives the IR carriers, convert into pulse/space sequences and then to scan codes, returning such codes to userspace (“scancode mode”). Other boards return just the pulse/space sequences (“raw mode”).

The support for remote controller in scancode mode is provided by the standard Linux input layer. The support for raw mode is provided via LIRC.

In order to check the support and test it, it is suggested to download the v4l-utils. It provides two tools to handle remote controllers:

- `ir-keytable`: provides a way to query the remote controller, list the protocols it supports, enable in-kernel support for IR decoder or switch the protocol and to test the reception of scan codes;
- `ir-ctl`: provide tools to handle remote controllers that support raw mode via LIRC interface.

Usually, the remote controller module is auto-loaded when the TV card is detected. However, for a few devices, you need to manually load the ir-kbd-i2c module.

4.2.2 How it works

The modules register the remote as keyboard within the Linux input layer, i.e. you’ll see the keys of the remote as normal key strokes (if CONFIG_INPUT_KEYBOARD is enabled).

Using the event devices (CONFIG_INPUT_EVDEV) it is possible for applications to access the remote via /dev/input/event<n> devices. The udev/systemd will automatically create the devices. If you install the v4l-utils, it may also automatically load a different keytable than the default one. Please see v4l-utils ir-keytable.1 man page for details.

The `ir-keytable` tool is nice for trouble shooting, i.e. to check whenever the input device is really present, which of the devices it is, check whenever pressing keys on the remote actually generates events and the like. You can also use any other input utility that changes the keymaps, like the input kbd utility.

4.3 Using with lircd

The latest versions of the lircd daemon supports reading events from the Linux input layer (via event device). It also supports receiving IR codes in lirc mode.

4.4 Using without lircd

Xorg recognizes several IR keycodes that have its numerical value lower than 247. With the advent of Wayland, the input driver got updated too, and should now accept all keycodes. Yet, you may want to just reassign the keycodes to something that your favorite media application likes.

This can be done by setting v4l-utils to load your own keytable in runtime. Please read ir-keytable.1 man page for details.
4.5 Tuner drivers

4.5.1 Simple tuner Programming

There are some flavors of Tuner programming APIs. These differ mainly by the bandswitch byte.

- **L** = LG_API (VHF_LO=0x01, VHF_HI=0x02, UHF=0x08, radio=0x04)
- **P** = PHILIPS_API (VHF_LO=0xA0, VHF_HI=0x90, UHF=0x30, radio=0x04)
- **T** = TEMIC_API (VHF_LO=0x02, VHF_HI=0x04, UHF=0x01)
- **A** = ALPS_API (VHF_LO=0x14, VHF_HI=0x12, UHF=0x11)
- **M** = PHILIPS_MK3 (VHF_LO=0x01, VHF_HI=0x02, UHF=0x04, radio=0x19)

4.5.2 Tuner Manufacturers

- SAMSUNG Tuner identification: (e.g. TCPM9091PD27)

    TCP [ABCDEFGH] 90[89][125] [DP] [ACD] 27 [ABCD]

    [ABCDEFGH]:
    A= BG+DK
    B= BG
    C= I+DK
    J= NTSC-Japan
    L= Secam LL
    M= BG+I+DK
    N= NTSC
    Q= BG+I+DK+LL

    [89]: ?
    [125]:
    2: No FM
    5: With FM

    [DP]:
    D= NTSC
    P= PAL

    [ACD]:
    A= F-connector
    C= Phono connector
    D= Din Jack

    [ABCD]:
    3-wire/I2C tuning, 2-band/3-band

These Tuners are PHILIPS_API compatible.

Philips Tuner identification: (e.g. FM1216MF)

    F[IRMQ]12[1345]6{MF|ME|MP}

    F[IRMQ]:
    FI12x6: Tuner Series
    FR12x6: Tuner + Radio IF
    FM12x6: Tuner + FM
    FQ12x6: special
    FMR12x6: special
    TD15xx: Digital Tuner ATSC

    12[1345]6:
    1216: PAL BG
    1236: NTSC
    1246: PAL I
    1256: PAL DK

    {MF|ME|MP}

    MF: BG LL w/ Secam (Multi France)
ME: BG DK I LL (Multi Europe)
MP: BG DK I (Multi PAL)
MR: BG DK M (?)
MG: BG DKI M (?)
MK2 series PHILIPS_API, most tuners are compatible to this one!
MK3 series introduced in 2002 w/ PHILIPS_MK3_API

Temic Tuner identification: (e.g 4006FH5)

```
4[01][0136][269]F[HYNR]5
40x2: Tuner (5V/33V), TEMIC_API.
40x6: Tuner 5V
41xx: Tuner compact
40x9: Tuner+FM compact
[0136]
xxox: PAL BG
xx1x: PAL DK, Secam LL
xx3x: NTSC
xx6x: PAL I
F[HYNR]5
FH5: Pal BG
FY5: others
FN5: multistandard
FR5: w/ FM radio
3X xxxx: order number with specific connector
```

Note: Only 40x2 series has TEMIC_API, all newer tuners have PHILIPS_API.

LG Innotek Tuner:

- TPI8NSR11: NTSC J/M (TPI8NSR01 w/FM) (P,210/497)
- TPI8PSB11: PAL B/G (TPI8PSB01 w/FM) (P,170/450)
- TAPC-I701: PAL I (TAPC-I001 w/FM) (P,170/450)
- TPI8PSB12: PAL D/K+B/G (TPI8PSB02 w/FM) (P,170/450)
- TAPC-G701P: PAL B/G (TAPC-G001P w/FM) (L,170/450)
- TAPC-W701P: PAL I (TAPC-W001P w/FM) (L,170/450)
- TAPC-Q703P: PAL D/K (TAPC-Q001P w/FM) (L,170/450)
- TAPC-Q704P: PAL D/K+I (L,170/450)
- TAPC-G702P: PAL D/K+B/G (L,170/450)
- TADC-H002F: NTSC (L,175/410?; 2-B, C-W+11, W+12-69)
- TADC-M201D: PAL D/K+B/G+I (L,143/425) (sound control at I2C address 0xc8)
- TADC-T003F: NTSC Taiwan (L,175/410?; 2-B, C-W+11, W+12-69)

**Suffix:**

- P= Standard phono female socket
- D= IEC female socket
- F= F-connector

Other Tuners:

- TCL2002MB-1: PAL BG + DK =TUNER_LG_PAL_NEW_TAPC
- TCL2002MB-1F: PAL BG + DK w/FM =PHILIPS_PAL
- TCL2002MI-2: PAL I = ??
ALPS Tuners:
  - Most are LG_API compatible
  - TSCH6 has ALPS_API (TSCH5 ?)
  - TSBE1 has extra API 05,02,08 Control_byte=0xCB Source:¹

4.6 Cards List

4.6.1 AU0828 cards list

| 0 | Unknown board (au0828) |

4.6. Cards List
34 -> Leadtek WinFast 2000/ WinFast 2000 XP  
35 -> Lifeview FlyVideo 98 LR50 / Chronos Video Shuttle II [1851:1850,1851:a050]  
36 -> Lifeview FlyVideo 98FM LR50 / Typhoon TView TV/FM Tuner [1852:1852]  
37 -> Prolink PixelView PlayTV pro  
38 -> Askey CPH06X TView99  
39 -> Pinnacle PCTV Studio/Rave  
40 -> STB TV PCI FM, Gateway P/N 6000704 (bt878), 3Dfx VoodooTV 100 [10b4:2636,10b4:2645,121a:3060]  
41 -> AVerMedia TVPhone 98  
42 -> ProVideo PV951  
43 -> Little OnAir TV  
44 -> Sigma TVII-FM  
45 -> MATRIX-Vision MV-Delta 2  
46 -> Zoltrix Genie TV/FM  
47 -> Terratec TV/Radio+  
48 -> Askey CPH03x/ Dynalink Magic TView  
49 -> IODATA GV-BCTV3/PCI  
50 -> Prolink PV-BT878P+4E / PixelView PlayTV PAK / Lenco MXTV-9578 CP  
51 -> Eagle Wireless Capricorn2 (bt878A)  
52 -> Pinnacle PCTV Studio Pro  
53 -> Typhoon TView RDS + FM Stereo / KNC1 TV Station RDS  
54 -> Lifeview FlyVideo 2000 /FlyVideo A2/ Lifetec LT 9415 TV [LR90]  
55 -> Askey CPH031/ BESTBUY Easy TV  
56 -> Lifeview FlyVideo 98FM LR50  
57 -> GrandTec 'Grand Video Capture' (Bt848)  
58 -> Askey CPH060/ Phoebe TV Master Only (No FM)  
59 -> Askey CPH03x T View Capturer  
60 -> Modular Technology MM100PTV  
61 -> AG Electronics GMV1  
62 -> Askey CPH061/ BESTBUY Easy TV (bt878)  
63 -> ATI TV-Wonder  
64 -> ATI TV-Wonder VE  
65 -> Lifeview FlyVideo 2000S LR90  
66 -> Terratec TV/valueRadio  
67 -> IODATA GV-BCTV4/PCI  
68 -> 3Dfx VoodooTV FM (Euro)  
69 -> Active Imaging AIMS  
70 -> Prolink PixelView PV-BT878P+ (Rev.4C,8E)  
71 -> Lifeview FlyVideo 98EZ (capture only) LR51 [1851:1851]  
72 -> Prolink PixelView PV-BT878P+9B (PlayTV Pro rev.9B FM+NICAM) [1554:4011]  
73 -> Sensory 311/611  
74 -> RemoteVision MX (RV605)  
75 -> Powercolor MTV878/ MTBV878R/ MTV878F  
76 -> Canopus WinDVR PCI (COMPAQ Presario 3524JP, 5112JP) [0e11:0079]  
77 -> GrandTeC Multi Capture Card (Bt878)  
78 -> Jetway TV/Capture Jw-TV788-FBK, Kworld KW-TV788RF  
79 -> DSP Design TCVIDEO  
80 -> Hauppauge WinTV PVR  
81 -> IODATA GV-BCTV5/PCI  
82 -> Osprey 100/150 (878)  
83 -> Osprey 100/150 (848)  
84 -> Osprey 101 (848)  
85 -> Osprey 101/151  
86 -> Osprey 101/151 w/ svid  
87 -> Osprey 200/201/250/251  
88 -> Osprey 200/250  
89 -> Osprey 210/220/230  
90 -> Osprey 500  
91 -> Osprey 540  
92 -> Osprey 2000

### 4.7 The bttv driver

#### 4.7.1 Release notes for bttv

You’ll need at least these config options for bttv:

```bash
CONFIG_I2C=m
CONFIG_I2C_ALGOBIT=m
CONFIG_VIDEO_DEV=m
```

The latest bttv version is available from [http://bytesex.org/bttv/](http://bytesex.org/bttv/)

#### 4.7.2 Make bttv work with your card

Just try “modprobe bttv” and see if that works.

If it doesn’t bttv likely could not autodetect your card and needs some insmod options. The most important insmod option for bttv is “card=n” to select the correct card type. If you get video but no sound you’ve very likely specified the wrong (or no) card type. A list of supported cards is in CARDLIST.bttv

If bttv takes very long to load (happens sometimes with the cheap cards which have no tuner), try adding this to your modules.conf:

```bash
options i2c-algo-bit bit_test=1
```

For the WinTV/PVR you need one firmware file from the driver CD: hcwamc.rbf. The file is in the pvr45xxx.exe archive (self-extracting zip file, unzip can unpack it). Put it into the /etc/pvr directory or use the firm_altera=〈path〉 insmod option to point the driver to the location of the file.

If your card isn’t listed in CARDLIST.bttv or if you have trouble making audio work, you should read the Sound-FAQ.
4.7.3 Autodetecting cards

bttv uses the PCI Subsystem ID to autodetect the card type. lspci lists the Subsystem ID in the second line, looks like this:

```
00:0a.0 Multimedia video controller: Brooktree Corporation Bt878 (rev 02)
  Subsystem: Hauppauge computer works Inc. WinTV/GO
  Flags: bus master, medium devsel, latency 32, IRQ 5
  Memory at e2000000 (32-bit, prefetchable) [size=4K]
```

only bt878-based cards can have a subsystem ID (which does not mean that every card really has one). bt848 cards can't have a Subsystem ID and therefore can't be autodetected. There is a list with the ID's in bttv-cards.c (in case you are intrested or want to mail patches with updates).

4.7.4 Still doesn't work?

I do NOT have a lab with 30+ different grabber boards and a PAL/NTSC/SECAM test signal generator at home, so I often can't reproduce your problems. This makes debugging very difficult for me. If you have some knowledge and spare time, please try to fix this yourself (patches very welcome of course...) You know: The linux slogan is “Do it yourself”.

There is a mailing list at [http://vger.kernel.org/vger-lists.html#linux-media](http://vger.kernel.org/vger-lists.html#linux-media)

If you have trouble with some specific TV card, try to ask there instead of mailing me directly. The chance that someone with the same card lists there is much higher...

For problems with sound: There are a lot of different systems used for TV sound all over the world. And there are also different chips which decode the audio signal. Reports about sound problems (“stereo doesn't work”) are pretty useless unless you include some details about your hardware and the TV sound scheme used in your country (or at least the country you are living in).

4.7.5 Modprobe options

Note: “modinfo <module>" prints various information about a kernel module, among them a complete and up-to-date list of insmod options. This list tends to be outdated because it is updated manually ...

```
bttv.o

the bt848/878 (grabber chip) driver

insmod args:
card=n    card type, see CARDOLIST for a list.
tuner=n   tuner type, see CARDOLIST for a list.
radio=0/1 card supports radio
pll=0/1/2 pll settings
  0: don't use PLL
  1: 28 MHz crystal installed
  2: 35 MHz crystal installed

triton1=0/1 for Triton1 (+others) compatibility
vsfx=0/1   yet another chipset bug compatibility bit
  see README.quirks for details on these two.
bigendian=n Set the endianness of the gfx framebuffer.
  Default is native endian.
fieldnr=0/1 Count fields. Some TV descrambling software
  needs this, for others it only generates
  50 useless IRQs/sec. default is 0 (off).
autoload=0/1 autoload helper modules (tuner, audio).
```
bttv_verbose=0/1/2 verbose level (at insmod time, while looking at the hardware). default is 1.

bttv_debug=0/1 debug messages (for capture). default is 0 (off).

irq_debug=0/1 irq handler debug messages. default is 0 (off).

gbuffers=2-32 number of capture buffers for mmap'ed capture. default is 4.

gbufsize= size of capture buffers. default and maximum value is 0x208000 (~2MB)

no_overlay=0 Enable overlay on broken hardware. There are some chipsets (SIS for example) which are known to have problems with the PCI DMA push used by bttv. bttv will disable overlay by default on this hardware to avoid crashes. With this insmod option you can override this.

no_overlay=1 Disable overlay. It should be used by broken hardware that doesn't support PCI2PCI direct transfers.

automute=0/1 Automatically mutes the sound if there is no TV signal, on by default. You might try to disable this if you have bad input signal quality which leading to unwanted sound dropouts.

chroma_agc=0/1 AGC of chroma signal, off by default.

adc_crush=0/1 Luminance ADC crush, on by default.

i2c_udelay= Allow reduce I2C speed. Default is 5 usecs (meaning 66,67 Kbps). The default is the maximum supported speed by kernel bitbang algorithm. You may use lower numbers, if I2C messages are lost (16 is known to work on all supported cards).

bttv_gpio=0/1 gpiomask=
audioall=
audiomux=

See Sound-FAQ for a detailed description.

remap, card, radio and pll accept up to four comma-separated arguments (for multiple boards).

tuner.o

The tuner driver. You need this unless you want to use only with a camera or external tuner ...

insmod args:

debug=1 print some debug info to the syslog
type=n type of the tuner chip. n as follows:
see CARDLIST for a complete list.
pal=[bdgil] select PAL variant (used for some tuners only, important for the audio carrier).

tvaudio.o

new, experimental module which is supported to provide a single driver for all simple i2c audio control chips (tda/tea*).

insmod args:
tda8425 = 1 enable/disable the support for the
tda9840 = 1 various chips.
tda9850 = 1  The tea6300 can't be autodetected and is therefore off by default, if you have tda9855 = 1  this one on your card (STB uses these) tda9873 = 1  you have to enable it explicitly. tea6300 = 0  The two tda985x chips use the same i2c address and can't be distinguished from each other, you might have to disable the wrong one. debug = 1  print debug messages

insmod args for tda9874a:
  tda9874a_SIF=1/2 select sound IF input pin (1 or 2) (default is pin 1)
  tda9874a_AMSEL=0/1 auto-mute select for NICAM (default=0)
  Please read note 3 below!
  tda9874a_STD=n select TV sound standard (0..8):
  0 - A2, B/G
  1 - A2, M (Korea)
  2 - A2, D/K (1)
  3 - A2, D/K (2)
  4 - A2, D/K (3)
  5 - NICAM, I
  6 - NICAM, B/G
  7 - NICAM, D/K (default)
  8 - NICAM, L

Note 1: tda9874a supports both tda9874h (old) and tda9874a (new) chips.
Note 2: tda9874h/a and tda9875 (which is supported separately by tda9875.o) use the same i2c address so both modules should not be used at the same time.
Note 3: Using tda9874a_AMSEL option depends on your TV card design!
   AMSEL=0: auto-mute will switch between NICAM sound and the sound on 1st carrier (i.e. FM mono or AM).
   AMSEL=1: auto-mute will switch between NICAM sound and the analog mono input (MONOIN pin).
If tda9874a decoder on your card has MONOIN pin not connected, then use only tda9874 AMSEL=0 or don't specify this option at all.
   For example:
   card=65 (FlyVideo 2000S) - set AMSEL=1 or AMSEL=0
   card=72 (Prolink PV-BT878P rev.9B) - set AMSEL=0 only

msp3400.o

The driver for the msp34xx sound processor chips. If you have a stereo card, you probably want to insmod this one.

insmod args:
  debug=1/2  print some debug info to the syslog, 2 is more verbose.
  simple=1   Use the "short programming" method. Newer msp34xx versions support this. You need this for dbx stereo. Default is on if supported by the chip.
  once=1     Don't check the TV-stations Audio mode every few seconds, but only once after channel switches.
  amsound=1  Audio carrier is AM/NICAM at 6.5 Mhz. This should improve things for french people, the carrier autoscan seems to work with FM only...

tea6300.o - OBSOLETE (use tvaudio instead)
The driver for the tea6300 fader chip. If you have a stereo card and the msp3400.o doesn't work, you might want to try this one. This chip is seen on most STB TV/FM cards (usually from Gateway OEM sold surplus on auction sites).

`insmod` args:

```
debug=1 print some debug info to the syslog.
```

tda8425.o - OBSOLETE (use tvaudio instead)

The driver for the tda8425 fader chip. This driver used to be part of bttv.c, so if your sound used to work but does not anymore, try loading this module.

`insmod` args:

```
debug=1 print some debug info to the syslog.
```

tda985x.o - OBSOLETE (use tvaudio instead)

The driver for the tda9850/55 audio chips.

`insmod` args:

```
debug=1 print some debug info to the syslog.
chip=9850/9855 set the chip type.
```

### 4.7.6 If the box freezeshard with bttv

It might be a bttv driver bug. It also might be bad hardware. It also might be something else ...

Just mailing me “bttv freezes” isn't going to help much. This README has a few hints how you can help to pin down the problem.

#### bttv bugs

If some version works and another doesn’t it is likely to be a driver bug. It is very helpful if you can tell where exactly it broke (i.e. the last working and the first broken version).

With a hard freeze you probably doesn't find anything in the logfiles. The only way to capture any kernel messages is to hook up a serial console and let some terminal application log the messages. /me uses screen. See Documentation/serial-console.txt for details on setting up a serial console.

Read Documentation/oops-tracing.txt to learn how to get any useful information out of a register+stack dump printed by the kernel on protection faults (so-called “kernel oops”).

If you run into some kind of deadlock, you can try to dump a call trace for each process using sysrq-t (see Documentation/sysrq.txt). This way it is possible to figure where exactly some process in “D” state is stuck.

I've seen reports that bttv 0.7.x crashes whereas 0.8.x works rock solid for some people. Thus probably a small buglet left somewhere in bttv 0.7.x. I have no idea where exactly, it works stable for me and a lot of other people. But in case you have problems with the 0.7.x versions you can give 0.8.x a try ...

#### hardware bugs

Some hardware can't deal with PCI-PCI transfers (i.e. grabber => vga). Sometimes problems show up with bttv just because of the high load on the PCI bus. The bt848/878 chips have a few workarounds for known incompatibilities, see README.quirks.
Some folks report that increasing the pci latency helps too, althouth I’m not sure whenever this really fixes the problems or only makes it less likely to happen. Both bttv and btaudio have a insmod option to set the PCI latency of the device.

Some mainboard have problems to deal correctly with multiple devices doing DMA at the same time. bttv + ide seems to cause this sometimes, if this is the case you likely see freezes only with video and hard disk access at the same time. Updating the IDE driver to get the latest and greatest workarounds for hardware bugs might fix these problems.

other

If you use some binary-only yunk (like nvidia module) try to reproduce the problem without.

IRQ sharing is known to cause problems in some cases. It works just fine in theory and many configurations. Nevertheless it might be worth a try to shuffle around the PCI cards to give bttv another IRQ or make it share the IRQ with some other piece of hardware. IRQ sharing with VGA cards seems to cause trouble sometimes. I’ve also seen funny effects with bttv sharing the IRQ with the ACPI bridge (and apci-enabled kernel).

4.7.7 Bttv quirks

Below is what the bt878 data book says about the PCI bug compatibility modes of the bt878 chip.

The triton1 insmod option sets the EN_TBFX bit in the control register. The vsfx insmod option does the same for EN_VSFX bit. If you have stability problems you can try if one of these options makes your box work solid.

drivers/pci/quirks.c knows about these issues, this way these bits are enabled automagically for known-buggy chipsets (look at the kernel messages, bttv tells you).

Normal PCI Mode

The PCI REQ signal is the logical-or of the incoming function requests. The inter-nal GNT[0:1] signals are gated asynchronously with GNT and demultiplexed by the audio request signal. Thus the arbiter defaults to the video function at power-up and parks there during no requests for bus access. This is desirable since the video will request the bus more often. However, the audio will have highest bus access priority. Thus the audio will have first access to the bus even when issuing a request after the video request but before the PCI external arbiter has granted access to the Bt879. Neither function can preempt the other once on the bus. The duration to empty the entire video PCI FIFO onto the PCI bus is very short compared to the bus access latency the audio PCI FIFO can tolerate.

430FX Compatibility Mode

When using the 430FX PCI, the following rules will ensure compatibility:

1. Deassert REQ at the same time as asserting FRAME.
2. Do not reassert REQ to request another bus transaction until after finish-ing the previous transaction.

Since the individual bus masters do not have direct control of REQ, a simple logical-or of video and audio requests would violate the rules. Thus, both the arbiter and the initiator contain 430FX compatibility mode logic. To enable 430FX mode, set the EN_TBFX bit as indicated in Device Control Register on page 104.

When EN_TBFX is enabled, the arbiter ensures that the two compatibility rules are satisfied. Before GNT is asserted by the PCI arbiter, this internal arbiter may still logical-or the two requests. However, once the GNT is issued, this arbiter must lock in its decision and now route only the granted request to the REQ pin. The arbiter decision lock happens regardless of the state of FRAME because it does not know when FRAME will be asserted (typically - each initiator will assert FRAME on the cycle following GNT). When FRAME is asserted, it is the initiator’s responsibility to remove its request at the same time. It is the
arbiters responsibility to allow this request to flow through to REQ and not allow the other request to hold
REQ asserted. The decision lock may be removed at the end of the transaction: for example, when the
bus is idle (FRAME and IRDY). The arbiter decision may then continue asynchronously until GNT is again
asserted.

Interfacing with Non-PCI 2.1 Compliant Core Logic

A small percentage of core logic devices may start a bus transaction during the same cycle that GNT
is de-asserted. This is non PCI 2.1 compliant. To ensure compatibility when using PCs with these PCI
controllers, the EN_VSFX bit must be enabled (refer to Device Control Register on page 104). When in
this mode, the arbiter does not pass GNT to the internal functions unless REQ is asserted. This prevents
a bus transaction from starting the same cycle as GNT is de-asserted. This also has the side effect of not
being able to take advantage of bus parking, thus lowering arbitration performance. The Bt879 drivers
must query for these non-compliant devices, and set the EN_VSFX bit only if required.

4.7.8 bttv and sound mini howto

There are a lot of different bt848/849/878/879 based boards available. Making video work often is not a
big deal, because this is handled completely by the bt8xx chip, which is common on all boards. But sound
is handled in slightly different ways on each board.

To handle the grabber boards correctly, there is a array tvcards[] in bttv-cards.c, which holds the informa-
tion required for each board. Sound will work only, if the correct entry is used (for video it often makes no
difference). The bttv driver prints a line to the kernel log, telling which card type is used. Like this one:

```
bttv0: model: BT848(Hauppauge old) [autodetected]
```

You should verify this is correct. If it isn’t, you have to pass the correct board type as insmod argument,
“insmod bttv card=2” for example. The file CARDLIST has a list of valid arguments for card. If your card
isn’t listed there, you might check the source code for new entries which are not listed yet. If there isn’t
one for your card, you can check if one of the existing entries does work for you (just trial and error...).

Some boards have an extra processor for sound to do stereo decoding and other nice features. The
msp34xx chips are used by Hauppauge for example. If your board has one, you might have to load a
helper module like msp3400.o to make sound work. If there isn’t one for the chip used on your board:
Bad luck. Start writing a new one. Well, you might want to check the video4linux mailing list archive
first...

Of course you need a correctly installed soundcard unless you have the speakers connected directly to the
grabber board. Hint: check the mixer settings too. ALSA for example has everything muted by default.

How sound works in detail

Still doesn’t work? Looks like some driver hacking is required. Below is a do-it-yourself description for
you.

The bt8xx chips have 32 general purpose pins, and registers to control these pins. One register is the
output enable register (BT848_GPIO_OUT_EN), it says which pins are actively driven by the bt848 chip.
Another one is the data register (BT848_GPIO_DATA), where you can get/set the status if these pins. They
can be used for input and output.

Most grabber board vendors use these pins to control an external chip which does the sound routing. But
every board is a little different. These pins are also used by some companies to drive remote control
receiver chips. Some boards use the i2c bus instead of the gpio pins to connect the mux chip.

As mentioned above, there is a array which holds the required information for each known board. You
basically have to create a new line for your board. The important fields are these two:
```c
struct tvcard {
    [ ... ]
    u32 gpiomask;
    u32 audiomux[6]; /* Tuner, Radio, external, internal, mute, stereo */
};
```

gpiomask specifies which pins are used to control the audio mux chip. The corresponding bits in the output enable register (BT848_GPIO_OUT_EN) will be set as these pins must be driven by the bt848 chip.

The `audiomux[]` array holds the data values for the different inputs (i.e. which pins must be high/low for tuner/mute/...). This will be written to the data register (BT848_GPIO_DATA) to switch the audio mux.

What you have to do is figure out the correct values for gpiomask and the `audiomux` array. If you have Windows and the drivers four your card installed, you might to check out if you can read these registers values used by the windows driver. A tool to do this is available from ftp://telepresence.dmem.strath.ac.uk/pub/bt848/winutil, but it doesn't work with bt878 boards according to some reports I received. Another one with bt878 support is available from http://btwincap.sourceforge.net/Files/btspy2.00.zip.

You might also dig around in the *.ini files of the Windows applications. You can have a look at the board to see which of the gpio pins are connected at all and then start trial-and-error ...

Starting with release 0.7.41 bttv has a number of insmod options to make the gpio debugging easier:

```
bttv_gpio=0/1 enable/disable gpio debug messages
gpiomask=n set the gpiomask value
audiomux=i,j,... set the values of the audiomux array
audioall=a set the values of the audiomux array (one value for all array elements, useful to check out which effect the particular value has).
```

The messages printed with `bttv_gpio=1` look like this:

```
bttv0: gpio: en=00000027, out=00000024 in=0fffffd8 [audio: off]
en = output _en_able register (BT848_GPIO_OUT_EN)
out = _out_put bits of the data register (BT848_GPIO_DATA),
i.e. BT848_GPIO_DATA & BT848_GPIO_OUT_EN
in = _in_put bits of the data register,
i.e. BT848_GPIO_DATA & ~BT848_GPIO_OUT_EN
```

**Other elements of the tvcards array**

If you are trying to make a new card work you might find it useful to know what the other elements in the `tvcard` array are good for:

```
video_inputs - # of video inputs the card has
audio_inputs - historical cruft, not used any more.
tuner - which input is the tuner
svhs - which input is svhs (all others are labeled composite)
muxsel - video mux, input->registervalue mapping
pll - same as pl= insmod option
tuner_type - same as tuner= insmod option
*_modulename - hint whenever some card needs this or that audio module loaded to work properly.
has_radio - whenever this TV card has a radio tuner.
no_msp34xx - "1" disables loading of msp3400.o module
no_tda9875 - "1" disables loading of tda9875.o module
needs_tvaudio - set to "1" to load tvaudio.o module
```

If some config item is specified both from the `tvcards` array and as `insmod` option, the `insmod` option takes precedence.
### 4.7.9 Cards

**Note:**

For a more updated list, please check [https://linuxtv.org/wiki/index.php/Hardware_Device_Information](https://linuxtv.org/wiki/index.php/Hardware_Device_Information)

**Supported cards: Bt848/Bt848a/Bt849/Bt878/Bt879 cards**

All cards with Bt848/Bt848a/Bt849/Bt878/Bt879 and normal Composite/S-VHS inputs are supported. Teletext and Intercast support (PAL only) for ALL cards via VBI sample decoding in software.

Some cards with additional multiplexing of inputs or other additional fancy chips are only partially supported (unless specifications by the card manufacturer are given). When a card is listed here it isn’t necessarily fully supported.

All other cards only differ by additional components as tuners, sound decoders, EEPROMs, teletext decoders ...

**MATRIX Vision**

MV-Delta - Bt848A - 4 Composite inputs, 1 S-VHS input (shared with 4th composite) - EEPROM

http://www.matrix-vision.de/

This card has no tuner but supports all 4 composite (1 shared with an S-VHS input) of the Bt848A. Very nice card if you only have satellite TV but several tuners connected to the card via composite.

Many thanks to Matrix-Vision for giving us 2 cards for free which made Bt848a/Bt849 single crystal operation support possible!!!

**Miro/Pinnacle PCTV**

- Bt848 some (all??) come with 2 crystals for PAL/SECAM and NTSC
- PAL, SECAM or NTSC TV tuner (Philips or TEMIC)
- MSP34xx sound decoder on add on board decoder is supported but AFAIK does not yet work (other sound MUX setting in GPIO port needed??? somebody who fixed this???)
- 1 tuner, 1 composite and 1 S-VHS input
- tuner type is autodetected

Many thanks for the free card which made first NTSC support possible back in 1997!

**Hauppauge Win/TV pci**

There are many different versions of the Hauppauge cards with different tuners (TV+Radio ...), teletext decoders. Note that even cards with same model numbers have (depending on the revision) different chips on it.

- Bt848 (and others but always in 2 crystal operation???) newer cards have a Bt878
- PAL, SECAM, NTSC or tuner with or without Radio support

**e.g.:**

- PAL:
- TDA5737: VHF, hyperband and UHF mixer/oscillator for TV and VCR 3-band tuners
- TSA5522: 1.4 GHz I2C-bus controlled synthesizer, I2C 0xc2-0xc3

• NTSC:
  - TDA5731: VHF, hyperband and UHF mixer/oscillator for TV and VCR 3-band tuners
  - TSA5518: no datasheet available on Philips site

• Philips SAA5246 or SAA5284 (or no) Teletext decoder chip with buffer RAM (e.g. Winbond W24257AS-35: 32Kx8 CMOS static RAM) SAA5246 (I2C 0x22) is supported

• 256 bytes EEPROM: Microchip 24LC02B or Philips 8582E2Y with configuration information I2C address 0xa0 (24LC02B also responds to 0xa2-0xaf)

• 1 tuner, 1 composite and (depending on model) 1 S-VHS input

• 14052B: mux for selection of sound source

• sound decoder: TDA9800, MSP34xx (stereo cards)

Askey CPH-Series

Developed by TelSignal(?), OEMed by many vendors (Typhoon, Anubis, Dynalink)

• Card series: - CPH01x: BT848 capture only - CPH03x: BT848 - CPH05x: BT878 with FM - CPH06x: BT878 (w/o FM) - CPH07x: BT878 capture only

• TV standards: - CPH0x0: NTSC-M/M - CPH0x1: PAL-B/G - CPH0x2: PAL-I/I - CPH0x3: PAL-D/K - CPH0x4: SECAM-L/L - CPH0x5: SECAM-B/G - CPH0x6: SECAM-D/K - CPH0x7: PAL-N/N - CPH0x8: PAL-B/H - CPH0x9: PAL-M/M

• CPH03x was often sold as “TV capturer”.

Identifying:

1. 878 cards can be identified by PCI Subsystem-ID: - 144f:3000 = CPH06x - 144F:3002 = CPH05x w/ FM - 144F:3005 = CPH06x LC (w/o remote control)

2. The cards have a sticker with “CPH”-model on the back.

3. These cards have a number printed on the PCB just above the tuner metal box: - “80-CP2000300-x” = CPH03X - “80-CP2000500-x” = CPH05X - “80-CP2000600-x” = CPH06X / CPH06x LC

Askey sells these cards as “Magic TVview series”, Brand “MagicXpress”. Other OEM often call these “Tvview”, “TView99” or else.

Lifeview Flyvideo Series:

The naming of these series differs in time and space.

Identifying:

1. Some models can be identified by PCI subsystem ID:
   • 1852:1852 = Flyvideo 98 FM
   • 1851:1850 = Flyvideo 98
   • 1851:1851 = Flyvideo 98 EZ (capture only)

2. There is a print on the PCB:
   • LR25 = Flyvideo (Zoran ZR36120, SAA7110A)
   • LR26 Rev.N = Flyvideo II (Bt848)
   • LR26 Rev.O = Flyvideo II (Bt878)
• LR37 Rev.C = Flyvideo EZ (Capture only, ZR36120 + SAA7110)
• LR38 Rev.A1= Flyvideo II EZ (Bt848 capture only)
• LR50 Rev.Q = Flyvideo 98 (w/EEPROM and PCI subsystem ID)
• LR50 Rev.W = Flyvideo 98 (no EEPROM)
• LR51 Rev.E = Flyvideo 98 EZ (capture only)
• LR90 = Flyvideo 2000 (Bt878)
• LR90 Flyvideo 2000S (Bt878) w/Stereo TV (Package w/ LR91 daughterboard)
• LR91 = Stereo daughter card for LR90
• LR97 = Flyvideo DVBS
• LR99 Rev.E = Low profile card for OEM integration (only internal audio!) bt878
• LR136 = Flyvideo 2100/3100 (Low profile, SAA7130/SAA7134)
• LR137 = Flyvideo DV2000/DV3000 (SAA7130/SAA7134 + IEEE1394)
• LR138 Rev.C= Flyvideo 2000 (SAA7130)
• LR138 Flyvideo 3000 (SAA7134) w/Stereo TV
  - These exist in variations w/FM and w/Remote sometimes denoted by suffixes “FM” and “R”.

3. You have a laptop (miniPCI card):
   • Product = FlyTV Platinum Mini
   • Model/Chip = LR212/saa7135
   • Lifeview.com.tw states (Feb. 2002): “The FlyVideo2000 and FlyVideo2000S product name have renamed to FlyVideo98.” Their Bt8x8 cards are listed as discontinued.
   • Flyvideo 2000S was probably sold as Flyvideo 3000 in some countries (Europe?). The new Flyvideo 2000/3000 are SAA7130/SAA7134 based.

“Flyvideo II” had been the name for the 848 cards, nowadays (in Germany) this name is re-used for LR50 Rev.W.

The Lifeview website mentioned Flyvideo III at some time, but such a card has not yet been seen (perhaps it was the German name for LR90 [stereo]). These cards are sold by many OEMs too.

FlyVideo A2 (Elta 8680)= LR90 Rev.F (w/Remote, w/o FM, stereo TV by tda9821) {Germany}
Lifeview 3000 (Elta 8681) as sold by Plus(April 2002), Germany = LR138 w/ ssa7134

**lifeview config coding on gpio pins 0-9**

- LR50. Q (“PARTS: 7031505116), Tuner wurde als Nr. 5 erkannt, Eingänge SVide, TV, Composite, Audio, Remote:
- CP9..1=100001001 (1: 0-Ohm-Widerstand gegen GND unbestückt; 0: bestückt)

**Typhoon TV card series:**

These can be CPH, Flyvideo, Pixelview or KNC1 series. Typhoon is the brand of Anubis. Model 50680 got re-used, some model no. had different contents over time.

Models:
- 50680 “TV Tuner PCI Pal BG” (old, red package)= can be CPH03x(bt848) or CPH06x(bt878)
- 50680 “TV Tuner Pal BG” (blue package)= Pixelview PV-BT878P+ (Rev 9B)
• 50681 “TV Tuner PCI Pal I” (variant of 50680)
• 50682 “TView TV/FM Tuner Pal BG” = Flyvideo 98FM (LR50 Rev.Q)

Note:
The package has a picture of CPH05x (which would be a real TView)

• 50683 “TV Tuner PCI SECAM” (variant of 50680)
• 50684 “TV Tuner Pal BG” = Pixelview 878TV(Rev.3D)
• 50686 “TV Tuner” = KNC1 TV Station
• 50687 “TV Tuner stereo” = KNC1 TV Station pro
• 50688 “TV Tuner RDS” (black package) = KNC1 TV Station RDS
• 50689 TV SAT DVB-S CARD CI PCI (SAA7146AH, SU1278?) = “KNC1 TV Station DVB-S”
• 50692 “TV/FM Tuner” (small PCB)
• 50694 TV TUNER CARD RDS (PHILIPS CHIPSET SAA7134HL)
• 50696 TV TUNER STEREO (PHILIPS CHIPSET SAA7134HL, MK3ME Tuner)
• 50804 PC-SAT TV/Audio Karte = Techni-PC-Sat (ZORAN 36120PQC, Tuner:Alps)
• 50866 TVIEW SAT RECEIVER+ADR

Lucky Star

- Image World Conference TV = LR50 Rev. Q

Leadtek

- WinView 601 (Bt848)
- WinView 610 (Zoran)
- WinFast2000
- WinFast2000 XP

Support for the Leadtek WinView 601 TV/FM

Author of this section: Jon Tombs <jon@gte.esi.us.es>

This card is basically the same as all the rest (Bt484A, Philips tuner), the main difference is that they have attached a programmable attenuator to 3 GPIO lines in order to give some volume control. They have also stuck an infra-red remote control decoded on the board, I will add support for this when I get time (it simple generates an interrupt for each key press, with the key code is placed in the GPIO port).

I don’t yet have any application to test the radio support. The tuner frequency setting should work but it is possible that the audio multiplexer is wrong. If it doesn’t work, send me email.

- No Thanks to Leadtek they refused to answer any questions about their hardware. The driver was written by visual inspection of the card. If you use this driver, send an email insult to them, and tell them you won’t continue buying their hardware unless they support Linux.

- Little thanks to Princeton Technology Corp (http://www.princeton.com.tw) who make the audio attenuator. Their publicly available data-sheet available on their web site doesn’t include the chip programming information!Hidden on their server are the full data-sheets, but don’t ask how I found it.

To use the driver I use the following options, the tuner and pll settings might be different in your country
inmod videodev insmod i2c scan=1 i2c_debug=0 verbose=0 insmod tuner type=1 debug=0 insmod btv pll=1 radio=1 card=17

KNC One

- TV-Station
- TV-Station SE (+Software Bundle)
- TV-Station pro (+TV stereo)
- TV-Station FM (+Radio)
- TV-Station RDS (+RDS)

- all boards:
  - Brooktree Bt848/848A/849/878/879: video capture chip
- Board specific
  - Miro PCTV:
    * Philips or Temic Tuner
  - Hauppauge Win/TV pci (version 405):
    * Microchip 24LC02B or Philips 8582E2Y:
      - 256 Byte EEPROM with configuration information
      - I2C 0xa0-0xa1, (24LC02B also responds to 0xa2-0xaf)
    * Philips SAA5246AGP/E: Videotext decoder chip, I2C 0x22-0x23
    * TDA9800: sound decoder
    * Winbond W24257AS-35: 32Kx8 CMOS static RAM (Videotext buffer mem)
    * 14052B: analog switch for selection of sound source
- PAL:
  - TDA5737: VHF, hyperband and UHF mixer/oscillator for TV and VCR 3-band tuners
  - TSA5522: 1.4 GHz I2C-bus controlled synthesizer, I2C 0xc2-0xc3
- NTSC:
  - TDA5731: VHF, hyperband and UHF mixer/oscillator for TV and VCR 3-band tuners
  - TSA5518: no datasheet available on Philips site
- STB TV pci:
  - ???
  - if you want better support for STB cards send me info! Look at the board! What chips are on it?

4.7.11 Specs

Philips http://www.Semiconductors.COM/pip/
Conexant http://www.conexant.com/
4.7.12 Thanks

Many thanks to:

- Markus Schroeder <schroedm@uni-duesseldorf.de> for information on the Bt848 and tuner programming and his control program xtvc.
- Martin Buck <martin-2.buck@student.uni-ulm.de> for his great Videotext package.
- Gerd Hoffmann for the MSP3400 support and the modular I2C, tuner, ... support.
- MATRIX Vision for giving us 2 cards for free, which made support of single crystal operation possible.
- MIRO for providing a free PCTV card and detailed information about the components on their cards. (E.g. how the tuner type is detected) Without their card I could not have debugged the NTSC mode.
- Hauppauge for telling how the sound input is selected and what components they do and will use on their radio cards. Also many thanks for faxing me the FM1216 data sheet.

4.8 The cafe_ccic driver

Author: Jonathan Corbet <corbet@lwn.net>

4.8.1 Introduction

“cafe_ccic” is a driver for the Marvell 88ALP01 “cafe” CMOS camera controller. This is the controller found in first-generation OLPC systems, and this driver was written with support from the OLPC project.

Current status: the core driver works. It can generate data in YUV422, RGB565, and RGB444 formats. (Anybody looking at the code will see RGB32 as well, but that is a debugging aid which will be removed shortly). VGA and QVGA modes work; CIF is there but the colors remain funky. Only the OV7670 sensor is known to work with this controller at this time.

To try it out: either of these commands will work:

```
$ mplayer tv:// -tv driver=v4l2:width=640:height=480 -nosound
$ mplayer tv:// -tv driver=v4l2:width=640:height=480:outfmt=bgr16 -nosound
```

The “xawtv” utility also works; gqcam does not, for unknown reasons.

4.8.2 Load time options

There are a few load-time options, most of which can be changed after loading via sysfs as well:
• alloc_bufs_at_load: Normally, the driver will not allocate any DMA buffers until the time comes to transfer data. If this option is set, then worst-case-sized buffers will be allocated at module load time. This option nails down the memory for the life of the module, but perhaps decreases the chances of an allocation failure later on.

• dma_buf_size: The size of DMA buffers to allocate. Note that this option is only consulted for load-time allocation; when buffers are allocated at run time, they will be sized appropriately for the current camera settings.

• n_dma_bufs: The controller can cycle through either two or three DMA buffers. Normally, the driver tries to use three buffers; on faster systems, however, it will work well with only two.

• minBuffers: The minimum number of streaming I/O buffers that the driver will consent to work with. Default is one, but, on slower systems, better behavior with mplayer can be achieved by setting to a higher value (like six).

• maxBuffers: The maximum number of streaming I/O buffers; default is ten. That number was carefully picked out of a hat and should not be assumed to actually mean much of anything.

• flip: If this boolean parameter is set, the sensor will be instructed to invert the video image. Whether it makes sense is determined by how your particular camera is mounted.

4.9 The cpia2 driver

Authors: Peter Pregler <Peter_Pregler@email.com>, Scott J. Bertin <scottbertin@yahoo.com>, and Jarl Tøtland <Jarl.Tøtland@bdc.no> for the original cpia driver, which this one was modelled from.

4.9.1 Introduction

This is a driver for STMicroelectronics’s CPIA2 (second generation Colour Processor Interface ASIC) based cameras. This camera outputs an MJPEG stream at up to vga size. It implements the Video4Linux interface as much as possible. Since the V4L interface does not support compressed formats, only an mjpeg enabled application can be used with the camera. We have modified the gqcam application to view this stream.

The driver is implemented as two kernel modules. The cpia2 module contains the camera functions and the V4L interface. The cpia2_usb module contains usb specific functions. The main reason for this was the size of the module was getting out of hand, so I separated them. It is not likely that there will be a parallel port version.

4.9.2 Features

• Supports cameras with the Vision stv6410 (CIF) and stv6500 (VGA) cmos sensors. I only have the vga sensor, so can’t test the other.

• Image formats: VGA, QVGA, CIF, QCIF, and a number of sizes in between. VGA and QVGA are the native image sizes for the VGA camera. CIF is done in the coprocessor by scaling QVGA. All other sizes are done by clipping.

• Palette: YCrCb, compressed with MJPEG.

• Some compression parameters are settable.

• Sensor framerate is adjustable (up to 30 fps CIF, 15 fps VGA).

• Adjust brightness, color, contrast while streaming.

• Flicker control settable for 50 or 60 Hz mains frequency.
### 4.9.3 Making and installing the stv672 driver modules

**Requirements**

Video4Linux must be either compiled into the kernel or available as a module. Video4Linux2 is automatically detected and made available at compile time.

**Setup**

Use `modprobe cpia2` to load and `modprobe -r cpia2` to unload. This may be done automatically by your distribution.

**Driver options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>video_nr</td>
<td>video device to register (0=/dev/video0, etc) range -1 to 64. default is -1 (first available) If you have more than 1 camera, this MUST be -1.</td>
</tr>
<tr>
<td>buffer_size</td>
<td>Size for each frame buffer in bytes (default 68k)</td>
</tr>
<tr>
<td>num_buffers</td>
<td>Number of frame buffers (1-32, default 3)</td>
</tr>
<tr>
<td>alternate</td>
<td>USB Alternate (2-7, default 7)</td>
</tr>
<tr>
<td>flicker_freq</td>
<td>Frequency for flicker reduction(50 or 60, default 60)</td>
</tr>
<tr>
<td>flicker_mode</td>
<td>0 to disable, or 1 to enable flicker reduction. (default 0). This is only effective if the camera uses a stv0672 coprocessor.</td>
</tr>
</tbody>
</table>

**Setting the options**

If you are using modules, edit `/etc/modules.conf` and add an options line like this:

```bash
options cpia2 num_buffers=3 buffer_size=65535
```

If the driver is compiled into the kernel, at boot time specify them like this:

```bash
cpia2.num_buffers=3 cpia2.buffer_size=65535
```

**What buffer size should I use?**

The maximum image size depends on the alternate you choose, and the frame rate achieved by the camera. If the compression engine is able to keep up with the frame rate, the maximum image size is given by the table below.

The compression engine starts out at maximum compression, and will increase image quality until it is close to the size in the table. As long as the compression engine can keep up with the frame rate, after a short time the images will all be about the size in the table, regardless of resolution.

At low alternate settings, the compression engine may not be able to compress the image enough and will reduce the frame rate by producing larger images.

The default of 68k should be good for most users. This will handle any alternate at frame rates down to 15fps. For lower frame rates, it may be necessary to increase the buffer size to avoid having frames dropped due to insufficient space.
### How many buffers should I use?

For normal streaming, 3 should give the best results. With only 2, it is possible for the camera to finish sending one image just after a program has started reading the other. If this happens, the driver must drop a frame. The exception to this is if you have a heavily loaded machine. In this case use 2 buffers. You are probably not reading at the full frame rate. If the camera can send multiple images before a read finishes, it could overwrite the third buffer before the read finishes, leading to a corrupt image. Single and double buffering have extra checks to avoid overwriting.

### Using the camera

We are providing a modified gqcam application to view the output. In order to avoid confusion, here it is called mview. There is also the qx5view program which can also control the lights on the qx5 microscope. MJPEG Tools (http://mjpeg.sourceforge.net) can also be used to record from the camera.

### Notes to developers

- This is a driver version stripped of the 2.4 back compatibility and old MJPEG ioctl API. See cpia2.sf.net for 2.4 support.

### Programmer’s overview of cpia2 driver

Cpia2 is the second generation video coprocessor from VLSI Vision Ltd (now a division of ST Microelectronics). There are two versions. The first is the STV0672, which is capable of up to 30 frames per second (fps) in frame sizes up to CIF, and 15 fps for VGA frames. The STV0676 is an improved version, which can handle up to 30 fps VGA. Both coprocessors can be attached to two CMOS sensors - the vvl6410 CIF sensor and the vvl6500 VGA sensor. These will be referred to as the 410 and the 500 sensors, or the CIF and VGA sensors.

The two chipsets operate almost identically. The core is an 8051 processor, running two different versions of firmware. The 672 runs the VP4 video processor code, the 676 runs VP5. There are a few differences in register mappings for the two chips. In these cases, the symbols defined in the header files are marked with VP4 or VP5 as part of the symbol name.

The cameras appear externally as three sets of registers. Setting register values is the only way to control the camera. Some settings are interdependant, such as the sequence required to power up the camera. I will try to make note of all of these cases.

The register sets are called blocks. Block 0 is the system block. This section is always powered on when the camera is plugged in. It contains registers that control housekeeping functions such as powering up the video processor. The video processor is the VP block. These registers control how the video from the sensor is processed. Examples are timing registers, user mode (vga, qvga), scaling, cropping, framerates, and so on. The last block is the video compressor (VC). The video stream sent from the camera is compressed as Motion JPEG (JPEGA). The VC controls all of the compression parameters. Looking at the file cpia2_registers.h, you can get a full view of these registers and the possible values for most of them.

One or more registers can be set or read by sending a usb control message to the camera. There are three modes for this. Block mode requests a number of contiguous registers. Random mode reads or writes

<table>
<thead>
<tr>
<th>Block</th>

</tr>
</tbody>
</table>

Table: Image size(bytes)
random registers with a tuple structure containing address/value pairs. The repeat mode is only used by VP4 to load a firmware patch. It contains a starting address and a sequence of bytes to be written into a gpio port.

### 4.10 The cx18 driver

**Note:**

This documentation is outdated.

Some notes regarding the cx18 driver for the Conexant CX23418 MPEG encoder chip:

1. Currently supported are:
   - Hauppauge HVR-1600
   - Compro VideoMate H900
   - Yuan MPC718
   - Conexant Raptor PAL/SECAM devkit

2. Some people have problems getting the i2c bus to work. The symptom is that the eeprom cannot be read and the card is unusable. This is probably fixed, but if you have problems then post to the video4linux or ivtv-users mailing list.

3. VBI (raw or sliced) has not yet been implemented.

4. MPEG indexing is not yet implemented.

5. The driver is still a bit rough around the edges, this should improve over time.

**Firmware:**

You can obtain the firmware files here:

http://dl.ivtvdriver.org/ivtv/firmware/cx18-firmware.tar.gz

Untar and copy the .fw files to your firmware directory.

### 4.11 The cx2341x driver

#### 4.11.1 Memory at cx2341x chips

This section describes the cx2341x memory map and documents some of the register space.

**Note:**

the memory long words are little-endian ('intel format').
Warning:

This information was figured out from searching through the memory and registers, this information may not be correct and is certainly not complete, and was not derived from anything more than searching through the memory space with commands like:

```
ivtvctl -O min=0x02000000,max=0x020000ff
```

So take this as is, I'm always searching for more stuff, it's a large register space :-).

Memory Map

The cx2341x exposes its entire 64M memory space to the PCI host via the PCI BAR0 (Base Address Register 0). The addresses here are offsets relative to the address held in BAR0.

<table>
<thead>
<tr>
<th>Address Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00000000-0x00ffffff</td>
<td>Encoder memory space</td>
</tr>
<tr>

  • 0xA064: APU command

**Interrupt Status Register**

The definition of the bits in the interrupt status register 0x0040, and the interrupt mask 0x0048. If a bit is cleared in the mask, then we want our ISR to execute.
  • bit 31 Encoder Start Capture
• bit 30 Encoder EOS
• bit 29 Encoder VBI capture
• bit 28 Encoder Video Input Module reset event
• bit 27 Encoder DMA complete
• bit 24 Decoder audio mode change detection event (through event notification)
• bit 22 Decoder data request
• bit 20 Decoder DMA complete
• bit 19 Decoder VBI re-insertion
• bit 18 Decoder DMA err (linked-list bad)

### 4.11.2 Missing documentation

- Encoder API post
- Decoder API post
- Decoder VTRACE event

### 4.11.3 The cx2341x firmware upload

This document describes how to upload the cx2341x firmware to the card.

**How to find**

See the web pages of the various projects that uses this chip for information on how to obtain the firmware.

The firmware stored in a Windows driver can be detected as follows:

- Each firmware image is 256k bytes.
- The 1st 32-bit word of the Encoder image is 0x0000da7
- The 1st 32-bit word of the Decoder image is 0x00003a7
- The 2nd 32-bit word of both images is 0xaa55bb66

**How to load**

- Issue the FWapi command to stop the encoder if it is running. Wait for the command to complete.
- Issue the FWapi command to stop the decoder if it is running. Wait for the command to complete.
- Issue the I2C command to the digitizer to stop emitting VSYNC events.
- Issue the FWapi command to halt the encoder’s firmware.
- Sleep for 10ms.
- Issue the FWapi command to halt the decoder’s firmware.
- Sleep for 10ms.
- Write 0x00000000 to register 0x2800 to stop the Video Display Module.
- Write 0x00000005 to register 0x2D00 to stop the AO (audio output?).
- Write 0x000000005 to register 0xA064 to ping? the APU.
- Write 0xFFFFFFFE to register 0x9058 to stop the VPU.
• Write 0xFFFFFFFF to register 0x9054 to reset the HW blocks.
• Write 0x00000001 to register 0x9050 to stop the SPU.
• Sleep for 10ms.
• Write 0x00000001A to register 0x07FC to init the Encoder SDRAM’s pre-charge.
• Write 0x80000640 to register 0x07F8 to init the Encoder SDRAM’s refresh to 1us.
• Write 0x00000001A to register 0x08FC to init the Decoder SDRAM’s pre-charge.
• Write 0x80000640 to register 0x08F8 to init the Decoder SDRAM’s refresh to 1us.
• Sleep for 512ms. (600ms is recommended)
• Transfer the encoder’s firmware image to offset 0 in Encoder memory space.
• Transfer the decoder’s firmware image to offset 0 in Decoder memory space.
• Use a read-modify-write operation to Clear bit 0 of register 0x9050 to re-enable the SPU.
• Sleep for 1 second.
• Use a read-modify-write operation to Clear bits 3 and 0 of register 0x9058 to re-enable the VPU.
• Sleep for 1 second.
• Issue status API commands to both firmware images to verify.

4.11.4 How to call the firmware API

The preferred calling convention is known as the firmware mailbox. The mailboxes are basically a fixed length array that serves as the call-stack.

Firmware mailboxes can be located by searching the encoder and decoder memory for a 16 byte signature. That signature will be located on a 256-byte boundary.

Signature:

| 0x78, 0x56, 0x34, 0x12, 0x12, 0x78, 0x56, 0x34, 0x34, 0x12, 0x78, 0x56, 0x56, 0x34, 0x12, 0x78 |

The firmware implements 20 mailboxes of 20 32-bit words. The first 10 are reserved for API calls. The second 10 are used by the firmware for event notification.

<table>
<thead>
<tr>
<th>Index</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Flags</td>
</tr>
<tr>
<td>1</td>
<td>Command</td>
</tr>
<tr>
<td>2</td>
<td>Return value</td>
</tr>
<tr>
<td>3</td>
<td>Timeout</td>
</tr>
<tr>
<td>4-19</td>
<td>Parameter/Result</td>
</tr>
</tbody>
</table>

The flags are defined in the following table. The direction is from the perspective of the firmware.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Direction</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>O</td>
<td>Firmware has processed the command.</td>
</tr>
<tr>
<td>1</td>
<td>I</td>
<td>Driver has finished setting the parameters.</td>
</tr>
<tr>
<td>0</td>
<td>I</td>
<td>Driver is using this mailbox.</td>
</tr>
</tbody>
</table>

The command is a 32-bit enumerator. The API specifics may be found in this chapter.

The return value is a 32-bit enumerator. Only two values are currently defined:

• 0=success
• -1=command undefined.
There are 16 parameters/results 32-bit fields. The driver populates these fields with values for all the parameters required by the call. The driver overwrites these fields with result values returned by the call.

The timeout value protects the card from a hung driver thread. If the driver doesn’t handle the completed call within the timeout specified, the firmware will reset that mailbox.

To make an API call, the driver iterates over each mailbox looking for the first one available (bit 0 has been cleared). The driver sets that bit, fills in the command enumerator, the timeout value and any required parameters. The driver then sets the parameter ready bit (bit 1). The firmware scans the mailboxes for pending commands, processes them, sets the result code, populates the result value array with that call’s return values and sets the call complete bit (bit 2). Once bit 2 is set, the driver should retrieve the results and clear all the flags. If the driver does not perform this task within the time set in the timeout register, the firmware will reset that mailbox.

Event notifications are sent from the firmware to the host. The host tells the firmware which events it is interested in via an API call. That call tells the firmware which notification mailbox to use. The firmware signals the host via an interrupt. Only the 16 Results fields are used, the Flags, Command, Return value and Timeout words are not used.

4.11.5 OSD firmware API description

Note:

this API is part of the decoder firmware, so it’s cx23415 only.

CX2341X_OSD_GET_FRAMEBUFFER

Enum: 65/0x41

Description

Return base and length of contiguous OSD memory.

Result[0]

OSD base address

Result[1]

OSD length

CX2341X_OSD_GET_PIXEL_FORMAT

Enum: 66/0x42

Description

Query OSD format
0=8bit index 1=16bit RGB 5:6:5 2=16bit ARGB 1:5:5:5 3=16bit ARGB 1:4:4:4 4=32bit ARGB 8:8:8:8

CX2341X_OSD_SET_PIXEL_FORMAT

Enum: 67/0x43

Description

Assign pixel format

Param[0]

• 0=8bit index
• 1=16bit RGB 5:6:5
• 2=16bit ARGB 1:5:5:5
• 3=16bit ARGB 1:4:4:4
• 4=32bit ARGB 8:8:8:8

CX2341X_OSD_GET_STATE

Enum: 68/0x44

Description

Query OSD state

Result[0]

• Bit 0 0=off, 1=on
• Bits 1:2 alpha control
• Bits 3:5 pixel format

CX2341X_OSD_SET_STATE

Enum: 69/0x45

Description

OSD switch

Param[0]

0=off, 1=on
**CX2341X_OSD_GET_OSD_COORDS**

**Enum:** 70/0x46

**Description**

Retrieve coordinates of OSD area blended with video

**Result[0]**

OSD buffer address

**Result[1]**

Stride in pixels

**Result[2]**

Lines in OSD buffer

**Result[3]**

Horizontal offset in buffer

**Result[4]**

Vertical offset in buffer

**CX2341X_OSD_SET_OSD_COORDS**

**Enum:** 71/0x47

**Description**

Assign the coordinates of the OSD area to blend with video

**Param[0]**

buffer address

**Param[1]**

buffer stride in pixels

**Param[2]**

lines in buffer
Param[3]
normal horizontal offset

Param[4]
vertical offset

**CX2341X_OSD_GET_SCREEN_COORDS**

Enum: 72/0x48

**Description**
Retrieve OSD screen area coordinates

**Result[0]**
top left horizontal offset

**Result[1]**
top left vertical offset

**Result[2]**
bottom right horizontal offset

**Result[3]**
bottom right vertical offset

**CX2341X_OSD_SET_SCREEN_COORDS**

Enum: 73/0x49

**Description**
Assign the coordinates of the screen area to blend with video

**Param[0]**
top left horizontal offset

**Param[1]**
top left vertical offset
Param[2]
bottom left horizontal offset

Param[3]
bottom left vertical offset

**CX2341X_OSD_GET_GLOBAL_ALPHA**

Enum: 74/0x4A

**Description**
Retrieve OSD global alpha

**Result[0]**
global alpha: 0=off, 1=on

**Result[1]**
bits 0:7 global alpha

**CX2341X_OSD_SET_GLOBAL_ALPHA**

Enum: 75/0x4B

**Description**
Update global alpha

**Param[0]**
global alpha: 0=off, 1=on

**Param[1]**
global alpha (8 bits)

**Param[2]**
local alpha: 0=on, 1=off

**CX2341X_OSD_SET_BLEND_COORDS**

Enum: 78/0x4C
Description

Move start of blending area within display buffer

Param[0]

horizontal offset in buffer

Param[1]

vertical offset in buffer

CX2341X_OSD_GET_FLICKER_STATE

Enum: 79/0x4F

Description

Retrieve flicker reduction module state

Result[0]

flicker state: 0=off, 1=on

CX2341X_OSD_SET_FLICKER_STATE

Enum: 80/0x50

Description

Set flicker reduction module state

Param[0]

State: 0=off, 1=on

CX2341X_OSD_BLT_COPY

Enum: 82/0x52

Description

BLT copy

Param[0]
'0000'  zero
'0001'  ~destination AND ~source
'0010'  ~destination AND source
'0011'  ~destination
'0100'  destination AND ~source
'0101'  ~source
'0110'  destination XOR source
'0111'  ~destination OR ~source
'1000'  ~destination AND ~source
'1001'  destination XNOR source
'1010'  source
'1011'  ~destination OR source
'1100'  destination
'1101'  destination OR ~source
'1110'  destination OR source
'1111'  one

**Param[1]**

Resulting alpha blending

- ‘01’ source_alpha
- ‘10’ destination_alpha
- ‘11’ source_alpha*destination_alpha+1 (zero if both source and destination alpha are zero)

**Param[2]**

'00' output_pixel = source_pixel

'01' if source_alpha=0:
  output_pixel = destination_pixel
  if 256 > source_alpha > 1:
    output_pixel = ((source_alpha + 1)*source_pixel +
      (255 - source_alpha)*destination_pixel)/256

'10' if destination_alpha=0:
  output_pixel = source_pixel
  if 255 > destination_alpha > 0:
    output_pixel = ((255 - destination_alpha)*source_pixel +
      (destination_alpha + 1)*destination_pixel)/256

'11' if source_alpha=0:
  source_temp = 0
  if source_alpha=255:
    source_temp = source_pixel*256
  if 255 > source_alpha > 0:
    source_temp = source_pixel*(source_alpha + 1)
  if destination_alpha=0:
    destination_temp = 0
  if destination_alpha=255:
    destination_temp = destination_pixel*256
  if 255 > destination_alpha > 0:
    destination_temp = destination_pixel*(destination_alpha + 1)
  output_pixel = (source_temp + destination_temp)/256

4.11. The cx2341x driver
Param[3]
width

Param[4]
height

Param[5]
destination pixel mask

Param[6]
destination rectangle start address

Param[7]
destination stride in dwords

Param[8]
source stride in dwords

Param[9]
source rectangle start address

CX2341X_OSD_BLT_FILL
Enum: 83/0x53

Description
BLT fill color

Param[0]
Same as Param[0] on API 0x52

Param[1]
Same as Param[1] on API 0x52

Param[2]
Same as Param[2] on API 0x52
Param[3]
width

Param[4]
height

Param[5]
destination pixel mask

Param[6]
destination rectangle start address

Param[7]
destination stride in dwords

Param[8]
color fill value

CX2341X_OSD_BLT_TEXT
Enum: 84/0x54

Description
BLT for 8 bit alpha text source

Param[0]
Same as Param[0] on API 0x52

Param[1]
Same as Param[1] on API 0x52

Param[2]
Same as Param[2] on API 0x52

Param[3]
width
Param[0]

window width

Param[1]

window height

Param[2]

top left window corner horizontal offset

CX2341X_OSD_SET_FRAMEBUFFER_WINDOW

Enum: 86/0x56

Description

Positions the main output window on the screen. The coordinates must be such that the entire window fits on the screen.
Param[3]

top left window corner vertical offset

**CX2341X_OSD_SET_CHROMA_KEY**

Enum: 96/0x60

**Description**

Chroma key switch and color

**Param[0]**

state: 0=off, 1=on

**Param[1]**

color

**CX2341X_OSD_GET_ALPHA_CONTENT_INDEX**

Enum: 97/0x61

**Description**

Retrieve alpha content index

**Result[0]**

alpha content index, Range 0:15

**CX2341X_OSD_SET_ALPHA_CONTENT_INDEX**

Enum: 98/0x62

**Description**

Assign alpha content index

**Param[0]**

alpha content index, range 0:15
4.11.6 Encoder firmware API description

CX2341X_ENC_PING_FW

Enum: 128/0x80

Description

Does nothing. Can be used to check if the firmware is responding.

CX2341X_ENC_START_CAPTURE

Enum: 129/0x81

Description

Commences the capture of video, audio and/or VBI data. All encoding parameters must be initialized prior to this API call. Captures frames continuously or until a predefined number of frames have been captured.

Param[0]

Capture stream type:
  • 0=MPEG
  • 1=Raw
  • 2=Raw passthrough
  • 3=VBI

Param[1]

Bitmask:
  • Bit 0 when set, captures YUV
  • Bit 1 when set, captures PCM audio
  • Bit 2 when set, captures VBI (same as param[0]=3)
  • Bit 3 when set, the capture destination is the decoder (same as param[0]=2)
  • Bit 4 when set, the capture destination is the host

Note:

this parameter is only meaningful for RAW capture type.

CX2341X_ENC_STOP_CAPTURE

Enum: 130/0x82
**Description**

Ends a capture in progress

**Param[0]**

- 0 = stop at end of GOP (generates IRQ)
- 1 = stop immediate (no IRQ)

**Param[1]**

Stream type to stop, see param[0] of API 0x81

**Param[2]**

Subtype, see param[1] of API 0x81

**CX2341X_ENC_SET_AUDIO_ID**

Enum: 137/0x89

**Description**

Assigns the transport stream ID of the encoded audio stream

**Param[0]**

Audio Stream ID

**CX2341X_ENC_SET_VIDEO_ID**

Enum: 139/0x8B

**Description**

Set video transport stream ID

**Param[0]**

Video stream ID

**CX2341X_ENC_SET_PCR_ID**

Enum: 141/0x8D

**Description**

Assigns the transport stream ID for PCR packets
Param[0]

PCR Stream ID

**CX2341X_ENC_SET_FRAME_RATE**

Enum: 143/0x8F

**Description**

Set video frames per second. Change occurs at start of new GOP.

**Param[0]**

- 0=30fps
- 1=25fps

**CX2341X_ENC_SET_FRAME_SIZE**

Enum: 145/0x91

**Description**

Select video stream encoding resolution.

**Param[0]**

Height in lines. Default 480

**Param[1]**

Width in pixels. Default 720

**CX2341X_ENC_SET_BIT_RATE**

Enum: 149/0x95

**Description**

Assign average video stream bitrate.

**Param[0]**

0=variable bitrate, 1=constant bitrate

**Param[1]**

bitrate in bits per second
Param[2]
peak bitrate in bits per second, divided by 400

Param[3]
Mux bitrate in bits per second, divided by 400. May be 0 (default).

Param[4]
Rate Control VBR Padding

Param[5]
VBV Buffer used by encoder

Note:
2. Param[5] doesn’t seem to be used.

CX2341X_ENC_SET_GOP_PROPERTIES
Enum: 151/0x97
Description
Setup the GOP structure

Param[0]
GOP size (maximum is 34)

Param[1]
Number of B frames between the I and P frame, plus 1. For example: IBBPPBBPBBB -> GOP size: 12, number of B frames: 2+1 = 3

Note:
GOP size must be a multiple of (B-frames + 1).

CX2341X_ENC_SET_ASPECT_RATIO
Enum: 153/0x99

4.11. The cx2341x driver
Description

Sets the encoding aspect ratio. Changes in the aspect ratio take effect at the start of the next GOP.

Param[0]

- ’0000’ forbidden
- ’0001’ 1:1 square
- ’0010’ 4:3
- ’0011’ 16:9
- ’0100’ 2.21:1
- ’0101’ to ‘1111’ reserved

**CX2341X_ENC_SET_DNR_FILTER_MODE**

Enum: 155/0x9B

Description

Assign Dynamic Noise Reduction operating mode

Param[0]

Bit0: Spatial filter, set=auto, clear=manual
Bit1: Temporal filter, set=auto, clear=manual

Param[1]

Median filter:
- 0=Disabled
- 1=Horizontal
- 2=Vertical
- 3=Horiz/Vert
- 4=Diagonal

**CX2341X_ENC_SET_DNR_FILTER_PROPS**

Enum: 157/0x9D

Description

These Dynamic Noise Reduction filter values are only meaningful when the respective filter is set to “manual” (See API 0x9B)

Param[0]

Spatial filter: default 0, range 0:15
Param[1]

Temporal filter: default 0, range 0:31

**CX2341X_ENC_SET_CORING_LEVELS**

Enum: 159/0x9F

**Description**

Assign Dynamic Noise Reduction median filter properties.

Param[0]

Threshold above which the luminance median filter is enabled. Default: 0, range 0:255

Param[1]

Threshold below which the luminance median filter is enabled. Default: 255, range 0:255

Param[2]

Threshold above which the chrominance median filter is enabled. Default: 0, range 0:255

Param[3]

Threshold below which the chrominance median filter is enabled. Default: 255, range 0:255

**CX2341X_ENC_SET_SPATIAL_FILTER_TYPE**

Enum: 161/0xA1

**Description**

Assign spatial prefilter parameters

Param[0]

Luminance filter

- 0=Off
- 1=1D Horizontal
- 2=1D Vertical
- 3=2D H/V Separable (default)
- 4=2D Symmetric non-separable
Param[1]

Chrominance filter
  • 0=Off
  • 1=1D Horizontal (default)

**CX2341X_ENC_SET_VBI_LINE**

Enum: 183/0xB7

**Description**

Selects VBI line number.

**Param[0]**

- Bits 0:4 line number
- Bit 31 0=top_field, 1=bottom_field
- Bits 0:31 all set specifies “all lines”

**Param[1]**

VBI line information features: 0=disabled, 1=enabled

**Param[2]**

Slicing: 0=None, 1=Closed Caption Almost certainly not implemented. Set to 0.

**Param[3]**

Luminance samples in this line. Almost certainly not implemented. Set to 0.

**Param[4]**

Chrominance samples in this line Almost certainly not implemented. Set to 0.

**CX2341X_ENC_SET_STREAM_TYPE**

Enum: 185/0xB9

**Description**

Assign stream type
**Note:**

Transport stream is not working in recent firmwares. And in older firmwares the timestamps in the TS seem to be unreliable.

**Param[0]**

- 0=Program stream
- 1=Transport stream
- 2=MPEG1 stream
- 3=PES A/V stream
- 5=PES Video stream
- 7=PES Audio stream
- 10=DVD stream
- 11=VCD stream
- 12=SVCD stream
- 13=DVD_S1 stream
- 14=DVD_S2 stream

**CX2341X_ENC_SET_OUTPUT_PORT**

Enum: 187/0xBB

**Description**

Assign stream output port. Normally 0 when the data is copied through the PCI bus (DMA), and 1 when the data is streamed to another chip (pvrusb and cx88-blackbird).

**Param[0]**

- 0=Memory (default)
- 1=Streaming
- 2=Serial

**Param[1]**

Unknown, but leaving this to 0 seems to work best. Indications are that this might have to do with USB support, although passing anything but 0 only breaks things.

**CX2341X_ENC_SET_AUDIO_PROPERTIES**

Enum: 189/0xBD
Description

Set audio stream properties, may be called while encoding is in progress.

Note:

All bitfields are consistent with ISO11172 documentation except bits 2:3 which ISO docs define as:
- '11' Layer I
- '10' Layer II
- '01' Layer III
- '00' Undefined

This discrepancy may indicate a possible error in the documentation. Testing indicated that only Layer II is actually working, and that the minimum bitrate should be 192 kbps.

Param[0]

Bitmask:

0:1  '00' 44.1Khz
     '01' 48Khz
     '10' 32Khz
     '11' reserved

2:3  '01'=Layer I
     '10'=Layer II

4:7 Bitrate:

**CX2341X_ENC_HALT_FW**

Enum: 195/0xC3

**Description**

The firmware is halted and no further API calls are serviced until the firmware is uploaded again.

**CX2341X_ENC_GET_VERSION**

Enum: 196/0xC4

**Description**

Returns the version of the encoder firmware.

**Result[0]**

Version bitmask: - Bits 0:15 build - Bits 16:23 minor - Bits 24:31 major

**CX2341X_ENC_SET_GOP_CLOSURE**

Enum: 197/0xC5

**Description**

Assigns the GOP open/close property.
Linux Media Subsystem Documentation, Release 4.7.0+

**Param[0]**

- 0=Open
- 1=Closed

**CX2341X_ENC_GET_SEQ_END**

Enum: 198/0xC6

**Description**

Obtains the sequence end code of the encoder’s buffer. When a capture is started a number of interrupts are still generated, the last of which will have Result[0] set to 1 and Result[1] will contain the size of the buffer.

**Result[0]**

State of the transfer (1 if last buffer)

**Result[1]**

If Result[0] is 1, this contains the size of the last buffer, undefined otherwise.

**CX2341X_ENC_SET_PGM_INDEX_INFO**

Enum: 199/0xC7

**Description**

Sets the Program Index Information. The information is stored as follows:

```c
struct info {
    u32 length;       // Length of this frame
    u32 offset_low;   // Offset in the file of the
    u32 offset_high;  // start of this frame
    u32 mask1;        // Bits 0-2 are the type mask:
                        // 1=I, 2=P, 4=B
                        // 0=End of Program Index, other fields
                        // are invalid.
    u32 pts;          // The PTS of the frame
    u32 mask2;        // Bit 0 is bit 32 of the pts.
};

u32 table_ptr;
struct info index[400];
```

The table_ptr is the encoder memory address in the table were new entries will be written.

**Note:**

*This is a ringbuffer, so the table_ptr will wraparound.*
Param[0]

Picture Mask: - 0=No index capture - 1=I frames - 3=I,P frames - 7=I,P,B frames
(Seems to be ignored, it always indexes I, P and B frames)

Param[1]

Elements requested (up to 400)

Result[0]

Offset in the encoder memory of the start of the table.

Result[1]

Number of allocated elements up to a maximum of Param[1]

CX2341X_ENC_SET_VBI_CONFIG

Enum: 200/0xC8

Description

Configure VBI settings

Param[0]

Bitmap:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Insertion</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'0' Sliced</td>
<td>'000' insert in extension &amp; user data</td>
<td>'001' insert in private packets</td>
</tr>
<tr>
<td>'1' Raw</td>
<td>'010' separate stream and user data</td>
<td>'011' separate stream and private data</td>
</tr>
<tr>
<td></td>
<td>8:15 Stream ID (normally 0xBD)</td>
<td></td>
</tr>
</tbody>
</table>

Param[1]

Frames per interrupt (max 8). Only valid in raw mode.

Param[2]

Total raw VBI frames. Only valid in raw mode.

Param[3]

Start codes
Param[4]
Stop codes

Param[5]
Lines per frame

Param[6]
Byte per line

Result[0]
Observed frames per interrupt in raw mode only. Range 1 to Param[1]

Result[1]
Observed number of frames in raw mode. Range 1 to Param[2]

Result[2]
Memory offset to start or raw VBI data

CX2341X_ENC_SET_DMA_BLOCK_SIZE
Enum: 201/0xC9

Description
Set DMA transfer block size

Param[0]
DMA transfer block size in bytes or frames. When unit is bytes, supported block sizes are 2^7, 2^8 and 2^9 bytes.

Param[1]
Unit: 0=bytes, 1=frames

CX2341X_ENC_GET_PREV_DMA_INFO_MB_10
Enum: 202/0xCA
Description

Returns information on the previous DMA transfer in conjunction with bit 27 of the interrupt mask. Uses mailbox 10.

Result[0]

Type of stream

Result[1]

Address Offset

Result[2]

Maximum size of transfer

**CX2341X_ENC_GET_PREV_DMA_INFO_MB_9**

Enum: 203/0xCB

Description

Returns information on the previous DMA transfer in conjunction with bit 27 or 18 of the interrupt mask. Uses mailbox 9.

Result[0]

Status bits: - 0 read completed - 1 write completed - 2 DMA read error - 3 DMA write error - 4 Scatter-Gather array error

Result[1]

DMA type

Result[2]

Presentation Time Stamp bits 0..31

Result[3]

Presentation Time Stamp bit 32

**CX2341X_ENC_SCHED_DMA_TO_HOST**

Enum: 204/0xCC
Description

Setup DMA to host operation

**Param[0]**

Memory address of link list

**Param[1]**

Length of link list (wtf: what units ???)

**Param[2]**

DMA type (0=MPEG)

**CX2341X_ENC_INITIALIZE_INPUT**

Enum: 205/0xCD

**Description**

Initializes the video input

**CX2341X_ENC_SET_FRAME_DROP_RATE**

Enum: 208/0xD0

**Description**

For each frame captured, skip specified number of frames.

**Param[0]**

Number of frames to skip

**CX2341X_ENC_PAUSE_ENCODER**

Enum: 210/0xD2

**Description**

During a pause condition, all frames are dropped instead of being encoded.

**Param[0]**

- 0=Pause encoding
- 1=Continue encoding
**CX2341X_ENC_REFRESH_INPUT**

Enum: 211/0xD3

**Description**

Refreshes the video input

**CX2341X_ENC_SET_COPYRIGHT**

Enum: 212/0xD4

**Description**

Sets stream copyright property

**Param[0]**

- 0=Stream is not copyrighted
- 1=Stream is copyrighted

**CX2341X_ENC_SET_EVENT_NOTIFICATION**

Enum: 213/0xD5

**Description**

Setup firmware to notify the host about a particular event. Host must unmask the interrupt bit.

**Param[0]**

Event (0=refresh encoder input)

**Param[1]**

Notification 0=disabled 1=enabled

**Param[2]**

Interrupt bit

**Param[3]**

Mailbox slot, -1 if no mailbox required.

**CX2341X_ENC_SET_NUM_VSYNC_LINES**

Enum: 214/0xD6

4.11. The cx2341x driver
Description

Depending on the analog video decoder used, this assigns the number of lines for field 1 and 2.

Param[0]

Field 1 number of lines: - 0x00EF for SAA7114 - 0x00F0 for SAA7115 - 0x0105 for Micronas

Param[1]

Field 2 number of lines: - 0x00EF for SAA7114 - 0x00F0 for SAA7115 - 0x0106 for Micronas

**CX2341X_ENC_SET_PLACEHOLDER**

Enum: 215/0xD7

Description

Provides a mechanism of inserting custom user data in the MPEG stream.

Param[0]

- 0=extension & user data
- 1=private packet with stream ID 0xBD

Param[1]

Rate at which to insert data, in units of frames (for private packet) or GOPs (for ext. & user data)

Param[2]

Number of data DWORDs (below) to insert

Param[3]

Custom data 0

Param[4]

Custom data 1

Param[5]

Custom data 2
Param[6]
Custom data 3

Param[7]
Custom data 4

Param[8]
Custom data 5

Param[9]
Custom data 6

Param[10]
Custom data 7

Param[11]
Custom data 8

CX2341X_ENC_MUTE_VIDEO
Enum: 217/0xD9

Description
Video muting

Param[0]
Bit usage:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>‘0’=video not muted</td>
</tr>
<tr>
<td></td>
<td>’1’=video muted, creates frames with the YUV color defined below</td>
</tr>
<tr>
<td>1:7</td>
<td>Unused</td>
</tr>
<tr>
<td>8:15</td>
<td>V chrominance information</td>
</tr>
<tr>
<td>16:23</td>
<td>U chrominance information</td>
</tr>
<tr>
<td>24:31</td>
<td>Y luminance information</td>
</tr>
</tbody>
</table>

CX2341X_ENC_MUTE_AUDIO
Enum: 218/0xDA

4.11. The cx2341x driver
Description

Audio muting

Param[0]

- 0=audio not muted
- 1=audio muted (produces silent mpeg audio stream)

**CX2341X_ENC_SET_VERT_CROP_LINE**

Enum: 219/0xDB

Description

Something to do with ‘Vertical Crop Line’

Param[0]

If saa7114 and raw VBI capture and 60 Hz, then set to 10001. Else 0.

**CX2341X_ENC_MISC**

Enum: 220/0xDC

Description

Miscellaneous actions. Not known for 100% what it does. It’s really a sort of ioctl call. The first parameter is a command number, the second the value.

Param[0]

Command number:

<table>
<thead>
<tr>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>set initial SCR value when starting encoding (works).</td>
</tr>
<tr>
<td>2</td>
<td>set quality mode (apparently some test setting).</td>
</tr>
<tr>
<td>3</td>
<td>setup advanced VIM protection handling. Always 1 for the cx23416 and 0 for cx23415.</td>
</tr>
<tr>
<td>4</td>
<td>generate DVD compatible PTS timestamps</td>
</tr>
<tr>
<td>5</td>
<td>USB flush mode</td>
</tr>
<tr>
<td>6</td>
<td>something to do with the quantization matrix</td>
</tr>
<tr>
<td>7</td>
<td>set navigation pack insertion for DVD: adds 0xbf (private stream 2) packets to the MPEG. The size of these packets is 2048 bytes (including the header of 6 bytes: 0x000001bf + length). The payload is zeroed and it is up to the application to fill them in. These packets are apparently inserted every four frames.</td>
</tr>
<tr>
<td>8</td>
<td>enable scene change detection (seems to be a failure)</td>
</tr>
<tr>
<td>9</td>
<td>set history parameters of the video input module</td>
</tr>
<tr>
<td>10</td>
<td>set input field order of VIM</td>
</tr>
<tr>
<td>11</td>
<td>set quantization matrix</td>
</tr>
<tr>
<td>12</td>
<td>reset audio interface after channel change or input switch (has no argument). Needed for the cx2584x, not needed for the mspx4xx, but it doesn't seem to</td>
</tr>
</tbody>
</table>
do any harm calling it regardless.
13=set audio volume delay
14=set audio delay

Param[1]
Command value.

4.11.7 Decoder firmware API description

**Note:**

this API is part of the decoder firmware, so it's cx23415 only.

**CX2341X_DEC_PING_FW**

Enum: 0/0x00

**Description**

This API call does nothing. It may be used to check if the firmware is responding.

**CX2341X_DEC_START_PLAYBACK**

Enum: 1/0x01

**Description**

Begin or resume playback.

**Param[0]**

0 based frame number in GOP to begin playback from.

**Param[1]**

Specifies the number of muted audio frames to play before normal audio resumes. (This is not implemented in the firmware, leave at 0)

**CX2341X_DEC_STOP_PLAYBACK**

Enum: 2/0x02

**Description**

Ends playback and clears all decoder buffers. If PTS is not zero, playback stops at specified PTS.

4.11. The cx2341x driver
Param[0]

Display 0=last frame, 1=black

**Note:**

this takes effect immediately, so if you want to wait for a PTS, then use ‘0’, otherwise the screen goes to black at once. You can call this later (even if there is no playback) with a 1 value to set the screen to black.

Param[1]

PTS low

Param[2]

PTS high

CX2341X_DEC_SET_PLAYBACK_SPEED

Enum: 3/0x03

**Description**

Playback stream at speed other than normal. There are two modes of operation:

- Smooth: host transfers entire stream and firmware drops unused frames.
- Coarse: host drops frames based on indexing as required to achieve desired speed.

Param[0]

**Bitmap:**

| 0:7 | 0 normal          |
|     | 1 fast only "1.5 times" |
|     | n nX fast, 1/nX slow |
| 30  | Framedrop:        |
|     | '0' during 1.5 times play, every other B frame is dropped |
|     | '1' during 1.5 times play, stream is unchanged (bitrate must not exceed 8mbps) |
| 31  | Speed:            |
|     | '0' slow         |
|     | '1' fast         |

**Note:**

n is limited to 2. Anything higher does not result in faster playback. Instead the host should start dropping frames.
Param[1]

Direction: 0=forward, 1=reverse

**Note:**

to make reverse playback work you have to write full GOPs in reverse order.

Param[2]

Picture mask:
1=I frames
3=I, P frames
7=I, P, B frames

Param[3]

B frames per GOP (for reverse play only)

**Note:**

for reverse playback the Picture Mask should be set to I or I, P. Adding B frames to the mask will result in corrupt video. This field has to be set to the correct value in order to keep the timing correct.

Param[4]

Mute audio: 0=disable, 1=enable

Param[5]

Display 0=frame, 1=field

Param[6]

Specifies the number of muted audio frames to play before normal audio resumes. (Not implemented in the firmware, leave at 0)

CX2341X_DEC_STEP_VIDEO

Enum: 5/0x05

**Description**

Each call to this API steps the playback to the next unit defined below in the current playback direction.
Param[0]
0=frame, 1=top field, 2=bottom field

**CX2341X_DEC_SET_DMA_BLOCK_SIZE**

Enum: 8/0x08

**Description**
Set DMA transfer block size. Counterpart to API 0xC9

Param[0]
DMA transfer block size in bytes. A different size may be specified when issuing the DMA transfer command.

**CX2341X_DEC_GET_XFER_INFO**

Enum: 9/0x09

**Description**
This API call may be used to detect an end of stream condition.

Result[0]
Stream type

Result[1]
Address offset

Result[2]
Maximum bytes to transfer

Result[3]
Buffer fullness

**CX2341X_DEC_GET_DMA_STATUS**

Enum: 10/0x0A

**Description**
Status of the last DMA transfer
Result[0]
Bit 1 set means transfer complete Bit 2 set means DMA error Bit 3 set means linked list error

Result[1]
DMA type: 0=MPEG, 1=OSD, 2=YUV

**CX2341X_DEC_SCHED_DMA_FROM_HOST**
Enum: 11/0x0B

**Description**
Setup DMA from host operation. Counterpart to API 0xCC

**Param[0]**
Memory address of link list

**Param[1]**
Total # of bytes to transfer

**Param[2]**
DMA type (0=MPEG, 1=OSD, 2=YUV)

**CX2341X_DEC_PAUSE_PLAYBACK**
Enum: 13/0x0D

**Description**
Freeze playback immediately. In this mode, when internal buffers are full, no more data will be accepted and data request IRQs will be masked.

**Param[0]**
Display: 0=last frame, 1=black

**CX2341X_DEC_HALT_FW**
Enum: 14/0x0E

**Description**
The firmware is halted and no further API calls are serviced until the firmware is uploaded again.
CX2341X_DEC_SET_STANDARD

Enum: 16/0x10

Description
Selects display standard

Param[0]

0=NTSC, 1=PAL

CX2341X_DEC_GET_VERSION

Enum: 17/0x11

Description
Returns decoder firmware version information

Result[0]

Version bitmask:
- Bits 0:15 build
- Bits 16:23 minor
- Bits 24:31 major

CX2341X_DEC_SET_STREAM_INPUT

Enum: 20/0x14

Description
Select decoder stream input port

Param[0]

0=memory (default), 1=streaming

CX2341X_DEC_GET_TIMING_INFO

Enum: 21/0x15

Description
Returns timing information from start of playback
Result[0]
Frame count by decode order

Result[1]
Video PTS bits 0:31 by display order

Result[2]
Video PTS bit 32 by display order

Result[3]
SCR bits 0:31 by display order

Result[4]
SCR bit 32 by display order

**CX2341X_DEC_SET_AUDIO_MODE**
Enum: 22/0x16

**Description**
Select audio mode

**Param[0]**

**Dual mono mode action**: 0=Stereo, 1=Left, 2=Right, 3=Mono, 4=Swap, -1=Unchanged

**Param[1]**

**Stereo mode action**: 0=Stereo, 1=Left, 2=Right, 3=Mono, 4=Swap, -1=Unchanged

**CX2341X_DEC_SET_EVENT_NOTIFICATION**
Enum: 23/0x17

**Description**
Setup firmware to notify the host about a particular event. Counterpart to API 0xD5
Param[0]

**Event:**
- 0=Audio mode change between mono, (joint) stereo and dual channel.
- 3=Decoder started
- 4=Unknown: goes off 10-15 times per second while decoding.
- 5=Some sync event: goes off once per frame.

Param[1]

Notification 0=disabled, 1=enabled

Param[2]

Interrupt bit

Param[3]

Mailbox slot, -1 if no mailbox required.

**CX2341X_DEC_SET_DISPLAY_BUFFERS**

Enum: 24/0x18

**Description**

Number of display buffers. To decode all frames in reverse playback you must use nine buffers.

Param[0]

0=six buffers, 1=nine buffers

**CX2341X_DEC_EXTRACT_VBI**

Enum: 25/0x19

**Description**

Extracts VBI data

Param[0]

0=extract from extension & user data, 1=extract from private packets

Result[0]

VBI table location
Result[1]
VBI table size

**CX2341X_DEC_SET_DECODER_SOURCE**

Enum: 26/0x1A

**Description**
Selects decoder source. Ensure that the parameters passed to this API match the encoder settings.

**Param[0]**
Mode: 0=MPEG from host, 1=YUV from encoder, 2=YUV from host

**Param[1]**
YUV picture width

**Param[2]**
YUV picture height

**Param[3]**
Bitmap: see Param[0] of API 0xBD

**CX2341X_DEC_SET_PREBUFFERING**

Enum: 30/0x1E

**Description**
Decoder prebuffering, when enabled up to 128KB are buffered for streams <8mpbs or 640KB for streams >8mbps

**Param[0]**
0=off, 1=on

4.11.8 PVR350 Video decoder registers 0x02002800 -> 0x02002B00

Author: Ian Armstrong <ian@iarmst.demon.co.uk>
Version: v0.4
Date: 12 March 2007
This list has been worked out through trial and error. There will be mistakes and omissions. Some registers have no obvious effect so it's hard to say what they do, while others interact with each other, or require a certain load sequence. Horizontal filter setup is one example, with six registers working in unison and requiring a certain load sequence to correctly configure. The indexed colour palette is much easier to set at just two registers, but again it requires a certain load sequence.

Some registers are fussy about what they are set to. Load in a bad value & the decoder will fail. A firmware reload will often recover, but sometimes a reset is required. For registers containing size information, setting them to 0 is generally a bad idea. For other control registers i.e. 2878, you’ll only find out what values are bad when it hangs.

These six registers control the horizontal aliasing filter for the Y plane. The first five registers must all be loaded before accessing the trigger (2818), as this register actually clocks the data through for the first five.

To correctly program set the filter, this whole procedure must be done 16 times. The actual register contents are copied from a lookup-table in the firmware which contains 4 different filter settings.
These six registers control the horizontal aliasing for the UV plane. Operation is the same as the Y filter, with 2830 being the trigger register.

NOTE: For both registers, the resulting image must be fully visible on screen. If the image exceeds the right edge both the source and destination size must be adjusted to reflect the visible portion. For the source width, you must take into account the scaling when calculating the new value.
Most of these registers either control horizontal scaling, or appear linked to it in some way. Register 2854 contains the 'master' value & the other registers can be calculated from that one. You must also remember to correctly set the divider in Reg 2874.

To enlarge:

Reg 2854 = (source_width * 0x00200000) / destination_width
Reg 2874 = No divide

To reduce from full size down to half size:

Reg 2854 = (source_width/2 * 0x00200000) / destination width
Reg 2874 = Divide by 2

To reduce from half size down to quarter size:

Reg 2854 = (source_width/4 * 0x00200000) / destination width
Reg 2874 = Divide by 4

The result is always rounded up.

Offset into the video image buffer. If the offset is gradually incremented, the on screen image will move left & wrap around higher up on the right.
2870
bits 0:15
  Decoder horizontal Y output offset

bits 16:31
  Decoder horizontal UV output offset

Offsets the actual video output. Controls output alignment of the Y & UV planes. The higher the value, the greater the shift to the left. Use reg 2890 to move the image right.

2874
bits 0:1
  Decoder horizontal Y output size divider
  00 = No divide
  01 = Divide by 2
  10 = Divide by 3

bits 4:5
  Decoder horizontal UV output size divider
  00 = No divide
  01 = Divide by 2
  10 = Divide by 3

bit 8
  Decoder ?? unknown
  0 = Normal
  1 = Affects video output levels

bit 16
  Decoder ?? unknown
  0 = Normal
  1 = Disable horizontal filter

2878
bit 0
  ?? unknown

bit 1
  osd on/off
  0 = osd off
  1 = osd on

bit 2
  Decoder + osd video timing
  0 = NTSC
  1 = PAL

bits 3:4
  ?? unknown

bit 5
  Decoder + osd
  Swaps upper & lower fields

287C
bits 0:10
  Decoder & osd ?? unknown
Moves entire screen horizontally. Starts at 0x005 with the screen shifted heavily to the right. Incrementing in steps of 0x004 will gradually shift the screen to the left.

bits 11:31
?? unknown

Normally contents are 0x00101111 (NTSC) or 0x1010111d (PAL)

 bit 0
 Decoder + osd ?? unknown
 0 = Normal
 1 = Misaligned fields (Correctable through 289C & 28A4)

bit 4
?? unknown

bit 8
?? unknown

Warning: Bad values will require a firmware reload to recover.
Known to be bad are 0x000,0x011,0x100,0x111

---------------------
288C
bits 0:15
 osd ?? unknown
 Appears to affect the osd position stability. The higher the value the more unstable it becomes. Decoder output remains stable.

bits 16:31
 osd ?? unknown
 Same as bits 0:15

---------------------
2890
bits 0:11
 Decoder output horizontal offset.

Horizontal offset moves the video image right. A small left shift is possible, but it’s better to use reg 2870 for that due to its greater range.

NOTE: Video corruption will occur if video window is shifted off the right edge. To avoid this read the notes for 2834 & 2838.

---------------------
2894
bits 0:23
 Decoder output video surround colour.

Contains the colour (in yuv) used to fill the screen when the video is running in a window.

---------------------
2898
bits 0:23
 Decoder video window colour
 Contains the colour (in yuv) used to fill the video window when the video is turned off.
bit 24
  Decoder video output
  0 = Video on
  1 = Video off

bit 28
  Decoder plane order
  0 = Y,UV
  1 = UV,Y

bit 29
  Decoder second plane byte order
  0 = Normal (UV)
  1 = Swapped (VU)

In normal usage, the first plane is Y & the second plane is UV. Though the order of the planes can be swapped, only the byte order of the second plane can be swapped. This isn't much use for the Y plane, but can be useful for the UV plane.

--------------------------------------------------------------
0x289C
  bits 0:15
    Decoder vertical field offset 1

bits 16:31
  Decoder vertical field offset 2

Controls field output vertical alignment. The higher the number, the lower the image on screen. Known starting values are 0x011E0017 (NTSC) & 0x01500017 (PAL)
--------------------------------------------------------------
0x28A0
  bits 0:15
    Decoder & osd width in pixels

bits 16:31
  Decoder & osd height in pixels

All output from the decoder & osd are disabled beyond this area. Decoder output will simply go black outside of this region. If the osd tries to exceed this area it will become corrupt.
--------------------------------------------------------------
0x28A4
  bits 0:11
    osd left shift.

Has a range of 0x770->0x7FF. With the exception of 0, any value outside of this range corrupts the osd.
--------------------------------------------------------------
0x28A8
  bits 0:15
    osd vertical field offset 1

bits 16:31
  osd vertical field offset 2

Controls field output vertical alignment. The higher the number, the lower the image on screen. Known starting values are 0x011E0017 (NTSC) & 0x01500017 (PAL)
--------------------------------------------------------------
0x28AC  -------- ??? unknown
V
28BC -------- ?? unknown

28C0
bit 0
  Current output field
    0 = first field
    1 = second field

bits 16:31
  Current scanline
    The scanline counts from the top line of the first field
    through to the last line of the second field.

28C4 -------- ?? unknown

28F8 -------- ?? unknown

28FC
bit 0
  ?? unknown
    0 = Normal
    1 = Breaks decoder & osd output

2900
bits 0:31
  Decoder vertical Y alias register 1

2904
bits 0:31
  Decoder vertical Y alias register 2

2908
bits 0:31
  Decoder vertical Y alias trigger

These three registers control the vertical aliasing filter for the Y plane.
Operation is similar to the horizontal Y filter (2804). The only real
difference is that there are only two registers to set before accessing
the trigger register (2908). As for the horizontal filter, the values are
taken from a lookup table in the firmware, and the procedure must be
repeated 16 times to fully program the filter.

290C
bits 0:31
  Decoder vertical UV alias register 1

2910
bits 0:31
  Decoder vertical UV alias register 2

2914
bits 0:31
  Decoder vertical UV alias trigger

These three registers control the vertical aliasing filter for the UV
plane. Operation is the same as the Y filter, with 2914 being the trigger.

2918
bits 0:15
  Decoder Y source height in pixels
### bits 16:31
Decoder Y destination height in pixels

<table>
<thead>
<tr>
<th>291C</th>
</tr>
</thead>
<tbody>
<tr>
<td>bits 0:15</td>
</tr>
<tr>
<td>Decoder UV source height in pixels divided by 2</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>291E</th>
</tr>
</thead>
<tbody>
<tr>
<td>bits 16:31</td>
</tr>
<tr>
<td>Decoder UV destination height in pixels</td>
</tr>
</tbody>
</table>

**NOTE:** For both registers, the resulting image must be fully visible on screen. If the image exceeds the bottom edge both the source and destination size must be adjusted to reflect the visible portion. For the source height, you must take into account the scaling when calculating the new value.

### 2920
bits 0:31
Decoder Y vertical scaling
Normally = Reg 2930 >> 2

### 2924
bits 0:31
Decoder Y vertical scaling
Normally = Reg 2920 + 0x514

### 2928
bits 0:31
Decoder UV vertical scaling
When enlarging = Reg 2930 >> 2
When reducing = Reg 2930 >> 3

### 292C
bits 0:31
Decoder UV vertical scaling
Normally = Reg 2928 + 0x514

### 2930
bits 0:31
Decoder 'master' value for vertical scaling

### 2934
bits 0:31
Decoder ?? unknown - Y vertical scaling

### 2938
bits 0:31
Decoder Y vertical scaling
Normally = Reg 2930

### 293C
bits 0:31
Decoder ?? unknown - Y vertical scaling

### 2940
bits 0:31
Decoder UV vertical scaling
When enlarging = Reg 2930 >> 1
When reducing = Reg 2930

### 2944
bits 0:31
Decoder ?? unknown - UV vertical scaling

### 4.11. The cx2341x driver
Most of these registers either control vertical scaling, or appear linked to it in some way. Register 2930 contains the 'master' value & all other registers can be calculated from that one. You must also remember to correctly set the divider in Reg 296C.

To enlarge:
\[ \text{Reg 2930} = \frac{\text{source height} \times 0x00200000}{\text{destination height}} \]
\[ \text{Reg 296C} = \text{No divide} \]

To reduce from full size down to half size:
\[ \text{Reg 2930} = \frac{\text{source height}/2 \times 0x00200000}{\text{destination height}} \]
\[ \text{Reg 296C} = \text{Divide by 2} \]

To reduce from half down to quarter:
\[ \text{Reg 2930} = \frac{\text{source height}/4 \times 0x00200000}{\text{destination height}} \]
\[ \text{Reg 296C} = \text{Divide by 4} \]
These two registers shift the Y plane up. The higher the number, the greater the shift.

These two registers shift the UV plane up. The higher the number, the greater the shift.

Decoder Y output size divider
00 = No divide
01 = Divide by 2
10 = Divide by 4

Decoder UV output size divider
00 = No divide
01 = Divide by 2
10 = Divide by 4

Decoder ?? unknown
0 = Normal
1 = Affect video output levels

Decoder ?? unknown
0 = Normal
1 = Disable vertical filter

osd colour mode
000 = 8 bit indexed
001 = 16 bit (565)
010 = 15 bit (555)
011 = 12 bit (444)
100 = 32 bit (8888)

osd display bpp
01 = 8 bit
10 = 16 bit
11 = 32 bit

bit 8
  osd global alpha
  0 = Off
  1 = On

bit 9
  osd local alpha
  0 = Off
  1 = On

bit 10
  osd colour key
  0 = Off
  1 = On

bit 11
  osd ?? unknown
  Must be 1

bit 13
  osd colour space
  0 = ARGB
  1 = AYVU

bits 16:31
  osd ?? unknown
  Must be 0x001B (some kind of buffer pointer ?)

When the bits-per-pixel is set to 8, the colour mode is ignored and assumed to be 8 bit indexed. For 16 & 32 bits-per-pixel the colour depth is honoured, and when using a colour depth that requires fewer bytes than allocated the extra bytes are used as padding. So for a 32 bpp with 8 bit index colour, there are 3 padding bytes per pixel. It's also possible to select 16bpp with a 32 bit colour mode. This results in the pixel width being doubled, but the color key will not work as expected in this mode.

Colour key is as it suggests. You designate a colour which will become completely transparent. When using 565, 555 or 444 colour modes, the colour key is always 16 bits wide. The colour to key on is set in Reg 2A18.

Local alpha works differently depending on the colour mode. For 32bpp & 8 bit indexed, local alpha is a per-pixel 256 step transparency, with 0 being transparent and 255 being solid. For the 16bpp modes 555 & 444, the unused bit(s) act as a simple transparency switch, with 0 being solid & 1 being fully transparent. There is no local alpha support for 16bit 565.

Global alpha is a 256 step transparency that applies to the entire osd, with 0 being transparent & 255 being solid.

It's possible to combine colour key, local alpha & global alpha.

<table>
<thead>
<tr>
<th>Reg</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2A04</td>
<td>bits 0:15</td>
<td>osd x coord for left edge</td>
</tr>
<tr>
<td></td>
<td>bits 16:31</td>
<td>osd y coord for top edge</td>
</tr>
<tr>
<td>2A08</td>
<td>bits 0:15</td>
<td>osd x coord for right edge</td>
</tr>
</tbody>
</table>
bits 16:31
    osd y coord for bottom edge

For both registers, (0,0) = top left corner of the display area. These
registers do not control the osd size, only where it’s positioned & how
much is visible. The visible osd area cannot exceed the right edge of the
display, otherwise the osd will become corrupt. See reg 2A10 for
setting osd width.
--------------------------------------------------------------------------------
2A0C
bits 0:31
    osd buffer index

An index into the osd buffer. Slowly incrementing this moves the osd left,
wrapping around onto the right edge
--------------------------------------------------------------------------------
2A10
bits 0:11
    osd buffer 32 bit word width

Contains the width of the osd measured in 32 bit words. This means that all
colour modes are restricted to a byte width which is divisible by 4.
--------------------------------------------------------------------------------
2A14
bits 0:15
    osd height in pixels

bits 16:32
    osd line index into buffer
    osd will start displaying from this line.
--------------------------------------------------------------------------------
2A18
bits 0:31
    osd colour key

Contains the colour value which will be transparent.
--------------------------------------------------------------------------------
2A1C
bits 0:7
    osd global alpha

Contains the global alpha value (equiv ivtvfbctl --alpha XX)

2A20 -------- ?? unknown
\|
V
2A2C -------- ?? unknown

2A30
bits 0:7
    osd colour to change in indexed palette

2A34
bits 0:31
    osd colour for indexed palette

To set the new palette, first load the index of the colour to change into
2A30, then load the new colour into 2A34. The full palette is 256 colours,
so the index range is 0x00-0xFF

2A38 -------- ?? unknown
2A3C -------- ?? unknown
4.11.9 The cx231xx DMA engine

This page describes the structures and procedures used by the cx2341x DMA engine.
Introduction

The cx2341x PCI interface is busmaster capable. This means it has a DMA engine to efficiently transfer large volumes of data between the card and main memory without requiring help from a CPU. Like most hardware, it must operate on contiguous physical memory. This is difficult to come by in large quantities on virtual memory machines.

Therefore, it also supports a technique called “scatter-gather”. The card can transfer multiple buffers in one operation. Instead of allocating one large contiguous buffer, the driver can allocate several smaller buffers.

In practice, I’ve seen the average transfer to be roughly 80K, but transfers above 128K were not uncommon, particularly at startup. The 128K figure is important, because that is the largest block that the kernel can normally allocate. Even still, 128K blocks are hard to come by, so the driver writer is urged to choose a smaller block size and learn the scatter-gather technique.

Mailbox #10 is reserved for DMA transfer information.

Note: the hardware expects little-endian data (‘intel format’).

Flow

This section describes, in general, the order of events when handling DMA transfers. Detailed information follows this section.

- The card raises the Encoder interrupt.
- The driver reads the transfer type, offset and size from Mailbox #10.
- The driver constructs the scatter-gather array from enough free dma buffers to cover the size.
- The driver schedules the DMA transfer via the ScheduleDMAtoHost API call.
- The card raises the DMA Complete interrupt.
- The driver checks the DMA status register for any errors.
- The driver post-processes the newly transferred buffers.

NOTE! It is possible that the Encoder and DMA Complete interrupts get raised simultaneously. (End of the last, start of the next, etc.)

Mailbox #10

The Flags, Command, Return Value and Timeout fields are ignored.

- Name: Mailbox #10
- Results[0]: Type: 0: MPEG.
- Results[1]: Offset: The position relative to the card's memory space.
- Results[2]: Size: The exact number of bytes to transfer.

My speculation is that since the StartCapture API has a capture type of “RAW” available, that the type field will have other values that correspond to YUV and PCM data.

Scatter-Gather Array

The scatter-gather array is a contiguously allocated block of memory that tells the card the source and destination of each data-block to transfer. Card “addresses” are derived from the offset supplied by Mailbox #10. Host addresses are the physical memory location of the target DMA buffer.

Each S-G array element is a struct of three 32-bit words. The first word is the source address, the second is the destination address. Both take up the entire 32 bits. The lowest 18 bits of the third word is the
transfer byte count. The high-bit of the third word is the “last” flag. The last-flag tells the card to raise the DMA_DONE interrupt. From hard personal experience, if you forget to set this bit, the card will still “work” but the stream will most likely get corrupted.

The transfer count must be a multiple of 256. Therefore, the driver will need to track how much data in the target buffer is valid and deal with it accordingly.

Array Element:
- 32-bit Source Address
- 32-bit Destination Address
- 14-bit reserved (high bit is the last flag)
- 18-bit byte count

**DMA Transfer Status**

Register 0x0004 holds the DMA Transfer Status:
- bit 0: read completed
- bit 1: write completed
- bit 2: DMA read error
- bit 3: DMA write error
- bit 4: Scatter-Gather array error

### 4.11.10 Non-compressed file format

The cx23416 can produce (and the cx23415 can also read) raw YUV output. The format of a YUV frame is specific to this chip and is called HM12. ‘HM’ stands for ‘Hauppauge Macroblock’, which is a misnomer as ‘Conexant Macroblock’ would be more accurate.

The format is YUV 4:2:0 which uses 1 Y byte per pixel and 1 U and V byte per four pixels.

The data is encoded as two macroblock planes, the first containing the Y values, the second containing UV macroblocks.

The Y plane is divided into blocks of 16x16 pixels from left to right and from top to bottom. Each block is transmitted in turn, line-by-line.

So the first 16 bytes are the first line of the top-left block, the second 16 bytes are the second line of the top-left block, etc. After transmitting this block the first line of the block on the right to the first block is transmitted, etc.

The UV plane is divided into blocks of 16x8 UV values going from left to right, top to bottom. Each block is transmitted in turn, line-by-line.

So the first 16 bytes are the first line of the top-left block and contain 8 UV value pairs (16 bytes in total). The second 16 bytes are the second line of 8 UV pairs of the top-left block, etc. After transmitting this block the first line of the block on the right to the first block is transmitted, etc.

The code below is given as an example on how to convert HM12 to separate Y, U and V planes. This code assumes frames of 720x576 (PAL) pixels.

The width of a frame is always 720 pixels, regardless of the actual specified width.

If the height is not a multiple of 32 lines, then the captured video is missing macroblocks at the end and is unusable. So the height must be a multiple of 32.
Raw format c example

```c
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

static unsigned char frame[576*720*3/2];
static unsigned char framerate[576*720];
static unsigned char frameu[576*720/4];
static unsigned char framev[576*720/4];

static void de_macro_y(unsigned char* dst, unsigned char* src, int dstride, int w, int h)
{
    unsigned int y, x, i;
    // descramble Y plane
    // dstride = 720 = w
    // The Y plane is divided into blocks of 16x16 pixels
    // Each block in transmitted in turn, line-by-line.
    for (y = 0; y < h; y += 16) {
        for (x = 0; x < w; x += 16) {
            for (i = 0; i < 16; i++) {
                memcpy(dst + x + (y + i) * dstride, src, 16);
                src += 16;
            }
        }
    }
}

static void de_macro_uv(unsigned char* dstu, unsigned char* dstv, unsigned char* src, int dstride, int w, int h)
{
    unsigned int y, x, i;
    // descramble U/V plane
    // dstride = 720/2 = w
    // The U/V values are interlaced (UVUV...).
    // Again, the Y plane is divided into blocks of 16x16 UV values.
    // Each block in transmitted in turn, line-by-line.
    for (y = 0; y < h; y += 16) {
        for (x = 0; x < w; x += 8) {
            for (i = 0; i < 16; i++) {
                int idx = x + (y + i) * dstride;
                dstu[idx+0] = src[0]; dstu[idx+1] = src[1];
                dstu[idx+2] = src[2]; dstu[idx+3] = src[3];
                dstu[idx+4] = src[4]; dstu[idx+5] = src[5];
                dstu[idx+6] = src[6]; dstu[idx+7] = src[7];
                dstv[idx+0] = src[8]; dstv[idx+1] = src[9];
                dstv[idx+4] = src[12]; dstv[idx+5] = src[13];
                dstv[idx+6] = src[14]; dstv[idx+7] = src[15];
                src += 16;
            }
        }
    }
}

/***************************************************************************/
int main(int argc, char **argv)
{
    FILE *fin;
    int i;
```

4.11. The cx2341x driver
if (argc == 1) fin = stdin;
else fin = fopen(argv[1], "r");

if (fin == NULL) {
    fprintf(stderr, "cannot open input\n");
    exit(-1);
}
while (fread(frame, sizeof(frame), 1, fin) == 1) {
    de_macro_y(framey, frame, 720, 720, 576);
    de_macro_uv(frameu, framev, frame + 720 * 576, 720 / 2, 720 / 2, 576 / 2);
    fwrite(framey, sizeof(framey), 1, stdout);
    fwrite(framev, sizeof(framev), 1, stdout);
    fwrite(frameu, sizeof(frameu), 1, stdout);
}
fclose(fin);
return 0;

4.11.11 Format of embedded V4L2_MPEG_STREAM_VBI_FMT_IVTV VBI data

Author: Hans Verkuil <hverkuil@xs4all.nl>

This section describes the V4L2_MPEG_STREAM_VBI_FMT_IVTV format of the VBI data embedded in an MPEG-2 program stream. This format is in part dictated by some hardware limitations of the ivtv driver (the driver for the Conexant cx23415/6 chips), in particular a maximum size for the VBI data. Anything longer is cut off when the MPEG stream is played back through the cx23415.

The advantage of this format is it is very compact and that all VBI data for all lines can be stored while still fitting within the maximum allowed size.

The stream ID of the VBI data is 0xBD. The maximum size of the embedded data is 4 + 43 * 36, which is 4 bytes for a header and 2 * 18 VBI lines with a 1 byte header and a 42 bytes payload each. Anything beyond this limit is cut off by the cx23415/6 firmware. Besides the data for the VBI lines we also need 36 bits for a bitmask determining which lines are captured and 4 bytes for a magic cookie, signifying that this data package contains V4L2_MPEG_STREAM_VBI_FMT_IVTV VBI data. If all lines are used, then there is no longer room for the bitmask. To solve this two different magic numbers were introduced:

‘itv0’: After this magic number two unsigned longs follow. Bits 0-17 of the first unsigned long denote which lines of the first field are captured. Bits 18-31 of the first unsigned long and bits 0-3 of the second unsigned long are used for the second field.

‘ITV0’: This magic number assumes all VBI lines are captured, i.e. it implicitly implies that the bitmasks are 0xffffffff and 0x0.

After these magic cookies (and the 8 byte bitmask in case of cookie ‘itv0’) the captured VBI lines start:
For each line the least significant 4 bits of the first byte contain the data type. Possible values are shown in the table below. The payload is in the following 42 bytes.

Here is the list of possible data types:

#define IVTV_SLICED_TYPE_TELETEXT 0x1 // Teletext (uses lines 6-22 for PAL)
#define IVTV_SLICED_TYPE_CC 0x4 // Closed Captions (line 21 NTSC)
#define IVTV_SLICED_TYPE_WSS 0x5 // Wide Screen Signal (line 23 PAL)
#define IVTV_SLICED_TYPE_VPS 0x7 // Video Programming System (PAL) (line 16)

4.12 The cx88 driver

Author: Gerd Hoffmann
This is a v4l2 device driver for the cx2388x chip.

### 4.12.1 Current status

**video**
- Works.
- Overlay isn’t supported.

**audio**
- Works. The TV standard detection is made by the driver, as the hardware has bugs to auto-detect.
- audio data dma (i.e. recording without loopback cable to the sound card) is supported via cx88-alsa.

**vbi**
- Works.

### 4.12.2 How to add support for new cards

The driver needs some config info for the TV cards. This stuff is in cx88-cards.c. If the driver doesn’t work well you likely need a new entry for your card in that file. Check the kernel log (using dmesg) to see whenever the driver knows your card or not. There is a line like this one:

```
cx8800[0]: subsystem: 0070:3400, board: Hauppauge WinTV \etu
  34xxx models [card=1, autodetected]
```

If your card is listed as “board: UNKNOWN/GENERIC” it is unknown to the driver. What to do then?

1. Try upgrading to the latest snapshot, maybe it has been added meanwhile.
2. You can try to create a new entry yourself, have a look at cx88-cards.c. If that worked, mail me your changes as unified diff (“diff -u”).
3. Or you can mail me the config information. We need at least the following information to add the card:
   - the PCI Subsystem ID (“0070:3400” from the line above, “lspci -v” output is fine too).
   - the tuner type used by the card. You can try to find one by trial-and-error using the tuner=<n> insmod option. If you know which one the card has you can also have a look at the list in CARDLIST.tuner

### 4.12.3 Documentation missing at the cx88 datasheet

MO_OUTPUT_FORMAT (0x310164)

Previous default from DScaler: 0x1c1f0008
Digit 8: 31-28
28: PREVREMOD = 1

Digit 7: 27-24 (0xc = 12 = b1100 )
27: COMBALT = 1
26: PAL_INV_PHASE
   (DScaler apparently set this to 1, resulted in sucky picture)

Digits 6,5: 23-16
25-16: COMB_RANGE = 0x1f [default] (9 bits -> max 512)
0x47 is the sync byte for MPEG-2 transport stream packets. Datasheet incorrectly states to use 47 decimal. 188 is the length. All DVB compliant frontends output packets with this start code.

### 4.12.4 Hauppauge WinTV cx88 IR information

The controls for the mux are GPIO [0,1] for source, and GPIO 2 for muting.

<table>
<thead>
<tr>
<th>GPIO0</th>
<th>GPIO1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

GPIO 16 (I believe) is tied to the IR port (if present).

From the data sheet:
- Register 24'h20004 PCI Interrupt Status
- bit [18] IR_SMP_INT Set when 32 input samples have been collected over gpio[16] pin into GP_SAMPLE register.

What’s missing from the data sheet:
- Setup 4KHz sampling rate (roughly 2x oversampled; good enough for our RC5 compat remote)
- set register 0x35C050 to 0xa80a80
- enable sampling
- set register 0x35C054 to 0x5
- enable the IRQ bit 18 in the interrupt mask register (and provide for a handler)

GP_SAMPLE register is at 0x35C058

Bits are then right shifted into the GP_SAMPLE register at the specified rate; you get an interrupt when a full DWORD is received. You need to recover the actual RC5 bits out of the (oversampled) IR sensor bits. (Hint: look for the 0/1and 1/0 crossings of the RC5 bi-phase data) An actual raw RC5 code will span 2-3 DWORDS, depending on the actual alignment.

I’m pretty sure when no IR signal is present the receiver is always in a marking state(1); but stray light, etc can cause intermittent noise values as well. Remember, this is a free running sample of the IR receiver state over time, so don’t assume any sample starts at any particular place.

---

This document has a how to decode a bi-phase data stream: [http://www.ee.washington.edu/circuit_archive/text/ir_decode.txt](http://www.ee.washington.edu/circuit_archive/text/ir_decode.txt)

This document has still more info: [http://www.xs4all.nl/~sbp/knowledge/ir/rc5.htm](http://www.xs4all.nl/~sbp/knowledge/ir/rc5.htm)

### 4.13 The VPBE V4L2 driver design

#### 4.13.1 File partitioning

- **V4L2 display device driver** drivers/media/platform/davinci/vpbe_display.c
  drivers/media/platform/davinci/vpbe_display.h

- **VPBE display controller** drivers/media/platform/davinci/vpbe.c drivers/media/platform/davinci/vpbe.h

- **VPBE venc sub device driver** drivers/media/platform/davinci/vpbe_venc.c
  drivers/media/platform/davinci/vpbe_venc.h drivers/media/platform/davinci/vpbe_venc_regs.h

- **VPBE osd driver** drivers/media/platform/davinci/vpbe_osd.c drivers/media/platform/davinci/vpbe_osd.h
  drivers/media/platform/davinci/vpbe_osd_regs.h

#### 4.13.2 Functional partitioning

Consists of the following (in the same order as the list under file partitioning):

1. **V4L2 display driver** Implements creation of video2 and video3 device nodes and provides v4l2 device interface to manage VID0 and VID1 layers.

2. **Display controller** Loads up VENC, OSD and external encoders such as ths8200. It provides a set of API calls to V4L2 drivers to set the output/standards in the VENC or external sub devices. It also provides a device object to access the services from OSD subdevice using sub device ops. The connection of external encoders to VENC LCD controller port is done at init time based on default output and standard selection or at run time when application change the output through V4L2 IOCTLs.

   When connected to an external encoder, vpbe controller is also responsible for setting up the interface between VENC and external encoders based on board specific settings (specified in board-xxx-evm.c). This allows interfacing external encoders such as ths8200. The setup_if_config() is implemented for this as well as configure_venc() (part of the next patch) API to set timings in VENC for a specific display resolution. As of this patch series, the interconnection and enabling and setting of the external encoders is not present, and would be a part of the next patch series.

3. **VENC subdevice module** Responsible for setting outputs provided through internal DACs and also setting timings at LCD controller port when external encoders are connected at the port or LCD panel timings required. When external encoder/LCD panel is connected, the timings for a specific standard/preset is retrieved from the board specific table and the values are used to set the timings in venc using non-standard timing mode.

   Support LCD Panel displays using the VENC. For example to support a Logic PD display, it requires setting up the LCD controller port with a set of timings for the resolution supported and setting the dot clock. So we could add the available outputs as a board specific entry (i.e add the “LogicPD” output name to board-xxx-evm.c). A table of timings for various LCDs supported can be maintained in the board specific setup file to support various LCD displays. As of this patch a basic driver is present, and this support for external encoders and displays forms a part of the next patch series.

---

**4.13. The VPBE V4L2 driver design**
4. OSD module OSD module implements all OSD layer management and hardware specific features. The VPBE module interacts with the OSD for enabling and disabling appropriate features of the OSD.

4.13.3 Current status

A fully functional working version of the V4L2 driver is available. This driver has been tested with NTSC and PAL standards and buffer streaming.

4.13.4 To be done

**vpbe display controller**
- Add support for external encoders.
- Add support for selecting external encoder as default at probe time.

**vpbe venc sub device**
- Add timings for supporting ths8200
- Add support for LogicPD LCD.

**FB drivers**
- Add support for fbdev drivers.- Ready and part of subsequent patches.

4.14 The Samsung S5P/EXYNOS4 FIMC driver

Copyright © 2012 - 2013 Samsung Electronics Co., Ltd.

The FIMC (Fully Interactive Mobile Camera) device available in Samsung SoC Application Processors is an integrated camera host interface, color space converter, image resizer and rotator. It's also capable of capturing data from LCD controller (FIMD) through the SoC internal writeback data path. There are multiple FIMC instances in the SoCs (up to 4), having slightly different capabilities, like pixel alignment constraints, rotator availability, LCD writeback support, etc. The driver is located at drivers/media/platform/exynos4-is directory.

4.14.1 Supported SoCs

S5PC100 (mem-to-mem only), S5PV210, EXYNOS4210

4.14.2 Supported features

- camera parallel interface capture (ITU-R.BT601/565);
- camera serial interface capture (MIPI-CSI2);
- memory-to-memory processing (color space conversion, scaling, mirror and rotation);
- dynamic pipeline re-configuration at runtime (re-attachment of any FIMC instance to any parallel video input or any MIPI-CSI front-end);
- runtime PM and system wide suspend/resume

4.14.3 Not currently supported

- LCD writeback input
- per frame clock gating (mem-to-mem)
4.14.4 Files partitioning

- media device driver drivers/media/platform/exynos4-is/media-dev.[ch]
- camera capture video device driver drivers/media/platform/exynos4-is/fimc-capture.c
- MIPI-CSI2 receiver subdev drivers/media/platform/exynos4-is/mipi-csis.[ch]
- video post-processor (mem-to-mem) drivers/media/platform/exynos4-is/fimc-core.c
- common files drivers/media/platform/exynos4-is/fimc-core.h drivers/media/platform/exynos4-is/fimc-reg.h drivers/media/platform/exynos4-is/regs-fimc.h

4.14.5 User space interfaces

Media device interface

The driver supports Media Controller API as defined at Part IV - Media Controller API. The media device driver name is “SAMSUNG S5P FIMC”.

The purpose of this interface is to allow changing assignment of FIMC instances to the SoC peripheral camera input at runtime and optionally to control internal connections of the MIPI-CSIS device(s) to the FIMC entities.

The media device interface allows to configure the SoC for capturing image data from the sensor through more than one FIMC instance (e.g. for simultaneous viewfinder and still capture setup). Reconfiguration is done by enabling/disabling media links created by the driver during initialization. The internal device topology can be easily discovered through media entity and links enumeration.

Memory-to-memory video node

V4L2 memory-to-memory interface at /dev/video? device node. This is standalone video device, it has no media pads. However please note the mem-to-mem and capture video node operation on same FIMC instance is not allowed. The driver detects such cases but the applications should prevent them to avoid an undefined behaviour.

Capture video node

The driver supports V4L2 Video Capture Interface as defined at Interfaces. At the capture and mem-to-mem video nodes only the multi-planar API is supported. For more details see: Single- and multi-planar APIs.

Camera capture subdevs

Each FIMC instance exports a sub-device node (/dev/v4l-subdev?), a sub-device node is also created per each available and enabled at the platform level MIPI-CSI receiver device (currently up to two).

sysfs

In order to enable more precise camera pipeline control through the sub-device API the driver creates a sysfs entry associated with “s5p-fimc-md” platform device. The entry path is: /sys/platform/devices/s5p-fimc-md/subdev_conf_mode.

In typical use case there could be a following capture pipeline configuration: sensor subdev -> mipi-csi subdev -> fimc subdev -> video node

When we configure these devices through sub-device API at user space, the configuration flow must be from left to right, and the video node is configured as last one. When we don’t use sub-device user
space API the whole configuration of all devices belonging to the pipeline is done at the video node
driver. The sysfs entry allows to instruct the capture node driver not to configure the sub-devices (format,
crop), to avoid resetting the subdevs’ configuration when the last configuration steps at the video node
is performed.

For full sub-device control support (subdevs configured at user space before starting streaming):

```
# echo "sub-dev" > /sys/platform/devices/s5p-fimc-md/subdev_conf_mode
```

For V4L2 video node control only (subdevs configured internally by the host driver):

```
# echo "vid-dev" > /sys/platform/devices/s5p-fimc-md/subdev_conf_mode
```

This is a default option.

### 4.14.6 5. Device mapping to video and subdev device nodes

There are associated two video device nodes with each device instance in hardware - video capture and
mem-to-mem and additionally a subdev node for more precise FIMC capture subsystem control. In addition
a separate v4l2 sub-device node is created per each MIPI-CSIS device.

How to find out which /dev/video? or /dev/v4l-subdev? is assigned to which device?

You can either grep through the kernel log to find relevant information, i.e.

```
# dmesg | grep -i fimc
```

(note that udev, if present, might still have rearranged the video nodes),
or retrieve the information from /dev/media? with help of the media-ctl tool:

```
# media-ctl -p
```

### 4.14.7 7. Build

If the driver is built as a loadable kernel module (CONFIG_VIDEO_SAMSUNG_S5P_FIMC=m) two modules
are created (in addition to the core v4l2 modules): s5p-fimc.ko and optional s5p-csis.ko (MIPI-CSI receiver
subdev).

### 4.15 The ivtv driver

Author: Hans Verkuil <hverkuil@xs4all.nl>

This is a v4l2 device driver for the Conexant cx23415/6 MPEG encoder/decoder. The cx23415 can do both
encoding and decoding, the cx23416 can only do MPEG encoding. Currently the only card featuring full
decoding support is the Hauppauge PVR-350.

**Note:**

1. This driver requires the latest encoder firmware (version 2.06.039, size 376836 bytes). Get the
firmware from here:
   https://linuxtv.org/downloads/firmware/#conexant
2. ‘normal’ TV applications do not work with this driver, you need an application that can handle
   MPEG input such as mplayer, xine, MythTV, etc.

The primary goal of the IVTV project is to provide a “clean room” Linux Open Source driver implementation
for video capture cards based on the iCompression iTVC15 or Conexant CX23415/CX23416 MPEG Codec.
4.15.1 Features

- Hardware mpeg2 capture of broadcast video (and sound) via the tuner or S-Video/Composite and audio line-in.
- Hardware mpeg2 capture of FM radio where hardware support exists
- Supports NTSC, PAL, SECAM with stereo sound
- Supports SAP and bilingual transmissions.
- Supports raw VBI (closed captions and teletext).
- Supports sliced VBI (closed captions and teletext) and is able to insert this into the captured MPEG stream.
- Supports raw YUV and PCM input.

4.15.2 Additional features for the PVR-350 (CX23415 based)

- Provides hardware mpeg2 playback
- Provides comprehensive OSD (On Screen Display: ie. graphics overlaying the video signal)
- Provides a framebuffer (allowing X applications to appear on the video device)
- Supports raw YUV output.

**IMPORTANT:** In case of problems first read this page: [https://help.ubuntu.com/community/Install_IVTV_Troubleshooting](https://help.ubuntu.com/community/Install_IVTV_Troubleshooting)

4.15.3 See also

[https://linuxtv.org](https://linuxtv.org)

4.15.4 IRC

irc://irc.freenode.net/#v4l

4.15.5 Devices

A maximum of 12 ivtv boards are allowed at the moment.

Cards that don’t have a video output capability (i.e. non PVR350 cards) lack the vbi8, vbi16, video16 and video48 devices. They also do not support the framebuffer device /dev/fbx for OSD.

The radio0 device may or may not be present, depending on whether the card has a radio tuner or not.

Here is a list of the base v4l devices:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Owner</th>
<th>Device</th>
<th>Date</th>
<th>Time</th>
<th>Path</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>
4.15.6 Base devices

For every extra card you have the numbers increased by one. For example, /dev/video0 is listed as the 'base' encoding capture device so we have:

- /dev/video0 is the encoding capture device for the first card (card 0)
- /dev/video1 is the encoding capture device for the second card (card 1)
- /dev/video2 is the encoding capture device for the third card (card 2)

Note that if the first card doesn't have a feature (e.g. no decoder, so no video16, the second card will still use video17. The simple rule is 'add the card number to the base device number'. If you have other capture cards (e.g. WinTV PCI) that are detected first, then you have to tell the ivtv module about it so that it will start counting at 1 (or 2, or whatever). Otherwise the device numbers can get confusing. The ivtv 'ivtv_first_minor' module option can be used for that.

- /dev/video0
  The encoding capture device(s).
  Read-only.
  Reading from this device gets you the MPEG1/2 program stream. Example:

  cat /dev/video0 > my.mpg (you need to hit ctrl-c to exit)

- /dev/video16
  The decoder output device(s)
  Write-only. Only present if the MPEG decoder (i.e. CX23415) exists.
  An mpeg2 stream sent to this device will appear on the selected video display, audio will appear on the line-out/audio out. It is only available for cards that support video out. Example:

  cat my.mpg >/dev/video16

- /dev/video24
  The raw audio capture device(s).
  Read-only
  The raw audio PCM stereo stream from the currently selected tuner or audio line-in. Reading from this device results in a raw (signed 16 bit Little Endian, 48000 Hz, stereo pcm) capture. This device only captures audio. This should be replaced by an ALSA device in the future. Note that there is no corresponding raw audio output device, this is not supported in the decoder firmware.

- /dev/video32
  The raw video capture device(s)
  Read-only
  The raw YUV video output from the current video input. The YUV format is non-standard (V4L2_PIX_FMT_HM12).
  Note that the YUV and PCM streams are not synchronized, so they are of limited use.

- /dev/video48
  The raw video display device(s)
  Write-only. Only present if the MPEG decoder (i.e. CX23415) exists.
  Writes a YUV stream to the decoder of the card.
• /dev/radio0
  The radio tuner device(s)
  Cannot be read or written.
  Used to enable the radio tuner and tune to a frequency. You cannot read or write audio streams with
  this device. Once you use this device to tune the radio, use /dev/video24 to read the raw pcm stream
  or /dev/video0 to get an mpeg2 stream with black video.

• /dev/vbi0
  The ‘vertical blank interval’ (Teletext, CC, WSS etc) capture device(s)
  Read-only
  Captures the raw (or sliced) video data sent during the Vertical Blank Interval. This data is used to
  encode teletext, closed captions, VPS, widescreen signalling, electronic program guide information,
  and other services.

• /dev/vbi8
  Processed vbi feedback device(s)
  Read-only. Only present if the MPEG decoder (i.e. CX23415) exists.
  The sliced VBI data embedded in an MPEG stream is reproduced on this device. So while playing
  back a recording on /dev/video16, you can read the embedded VBI data from /dev/vbi8.

• /dev/vbi16
  The vbi ‘display’ device(s)
  Write-only. Only present if the MPEG decoder (i.e. CX23415) exists.
  Can be used to send sliced VBI data to the video-out connector.

# 4.16 Vaio Picturebook Motion Eye Camera Driver

Copyright © 2001-2004 Stelian Pop <stelian@popies.net>
Copyright © 2001-2002 Alcôve <www.alcove.com>
Copyright © 2000 Andrew Tridgell <tridge@samba.org>

This driver enable the use of video4linux compatible applications with the Motion Eye camera. This driver
requires the “Sony Laptop Extras” driver (which can be found in the “Misc devices” section of the kernel
configuration utility) to be compiled and installed (using its “camera=1” parameter).

It can do at maximum 30 fps @ 320x240 or 15 fps @ 640x480.
Grabbing is supported in packed YUV colorspace only.
MJPEG hardware grabbing is supported via a private API (see below).

## 4.16.1 Hardware supported

This driver supports the ‘second’ version of the MotionEye camera :)
The first version was connected directly on the video bus of the Neomagic video card and is unsupported.
The second one, made by Kawasaki Steel is fully supported by this driver (PCI vendor/device is
0x136b/0xff01)
The third one, present in recent (more or less last year) Picturebooks (C1M* models), is not supported.
The manufacturer has given the specs to the developers under a NDA (which allows the development
of a GPL driver however), but things are not moving very fast (see http://r-engine.sourceforge.net/) (PCI vendor/device is 0x10cf/0x2011).

There is a forth model connected on the USB bus in TR1* Vaio laptops. This camera is not supported at all by the current driver, in fact little information if any is available for this camera (USB vendor/device is 0x054c/0x0107).

4.16.2 Driver options

Several options can be passed to the meye driver using the standard module argument syntax (<param>=<value> when passing the option to the module or meye.<param>=<value> on the kernel boot line when meye is statically linked into the kernel). Those options are:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gbuffers:</td>
<td>number of capture buffers, default is 2 (32 max)</td>
</tr>
<tr>
<td>gbuFSIZE:</td>
<td>size of each capture buffer, default is 614400</td>
</tr>
<tr>
<td>video_nr:</td>
<td>video device to register (0 = /dev/video0, etc)</td>
</tr>
</tbody>
</table>

4.16.3 Module use

In order to automatically load the meye module on use, you can put those lines in your /etc/modprobe.d/meye.conf file:

```sh
alias char-major-81 videodev
alias char-major-81-0 meye
options meye gbuffers=32
```

4.16.4 Usage:

```sh
xawtv >= 3.49 (http://bytesex.org/xawtv/)
for display and uncompressed video capture:
   xawtv -c /dev/video0 -geometry 640x480
   or
   xawtv -c /dev/video0 -geometry 320x240

motioneye (http://popies.net/meye/)
for getting ppm or jpg snapshots, mjpeg video
```

4.16.5 Private API

The driver supports frame grabbing with the video4linux API, so all video4linux tools (like xawtv) should work with this driver.

Besides the video4linux interface, the driver has a private interface for accessing the Motion Eye extended parameters (camera sharpness, agc, video framerate), the snapshot and the MJPEG capture facilities.

This interface consists of several ioctls (prototypes and structures can be found in include/linux/meye.h):

**MEYEIOC_G_PARAMS and MEYEIOC_S_PARAMS** Get and set the extended parameters of the motion eye camera. The user should always query the current parameters with MEYEIOC_G_PARAMS, change what he likes and then issue the MEYEIOC_S_PARAMS call (checking for -EINVAL). The extended parameters are described by the meye_params structure.
MEYEIOC_QBUF_CAPT Queue a buffer for capture (the buffers must have been obtained with a VIDIOC_GMBUF call and mmap’ed by the application). The argument to MEYEIOC_QBUF_CAPT is the buffer number to queue (or -1 to end capture). The first call to MEYEIOC_QBUF_CAPT starts the streaming capture.

MEYEIOC_SYNC Takes as an argument the buffer number you want to sync. This ioctl blocks until the buffer is filled and ready for the application to use. It returns the buffer size.

MEYEIOC_STILLCAPT and MEYEIOC_STILLJCAPT Takes a snapshot in an uncompressed or compressed jpeg format. This ioctl blocks until the snapshot is done and returns (for jpeg snapshot) the size of the image. The image data is available from the first mmap’ed buffer.

Look at the ‘motioneye’ application code for an actual example.

4.16.6 Bugs / Todo

- ‘motioneye’ still uses the meye private v4l1 API extensions.

4.17 OMAP 3 Image Signal Processor (ISP) driver

Copyright © 2010 Nokia Corporation
Copyright © 2009 Texas Instruments, Inc.
Contacts: Laurent Pinchart <laurent.pinchart@ideasonboard.com>, Sakari Ailus <sakari.ailus@iki.fi>, David Cohen <dacohen@gmail.com>

4.17.1 Introduction

This file documents the Texas Instruments OMAP 3 Image Signal Processor (ISP) driver located under drivers/media/platform/omap3isp. The original driver was written by Texas Instruments but since that it has been rewritten (twice) at Nokia.

The driver has been successfully used on the following versions of OMAP 3:

- 3430
- 3530
- 3630

The driver implements V4L2, Media controller and v4l2_subdev interfaces. Sensor, lens and flash drivers using the v4l2_subdev interface in the kernel are supported.

4.17.2 Split to subdevs

The OMAP 3 ISP is split into V4L2 subdevs, each of the blocks inside the ISP having one subdev to represent it. Each of the subdevs provide a V4L2 subdev interface to userspace.

- OMAP3 ISP CCP2
- OMAP3 ISP CSI2a
- OMAP3 ISP CCDC
- OMAP3 ISP preview
- OMAP3 ISP resizer
- OMAP3 ISP AEWB
- OMAP3 ISP AF
• OMAP3 ISP histogram

Each possible link in the ISP is modelled by a link in the Media controller interface. For an example program see 2.

4.17.3 Controlling the OMAP 3 ISP

In general, the settings given to the OMAP 3 ISP take effect at the beginning of the following frame. This is done when the module becomes idle during the vertical blanking period on the sensor. In memory-to-memory operation the pipe is run one frame at a time. Applying the settings is done between the frames.

All the blocks in the ISP, excluding the CSI-2 and possibly the CCP2 receiver, insist on receiving complete frames. Sensors must thus never send the ISP partial frames.

Autoidle does have issues with some ISP blocks on the 3430, at least. Autoidle is only enabled on 3630 when the omap3isp module parameter autoidle is non-zero.

4.17.4 Events

The OMAP 3 ISP driver does support the V4L2 event interface on CCDC and statistics (AEWB, AF and histogram) subdevs.

The CCDC subdev produces V4L2_EVENT_FRAME_SYNC type event on HS_VS interrupt which is used to signal frame start. Earlier version of this driver used V4L2_EVENT_OMAP3ISP_HS_VS for this purpose. The event is triggered exactly when the reception of the first line of the frame starts in the CCDC module. The event can be subscribed on the CCDC subdev.

(When using parallel interface one must pay account to correct configuration of the VS signal polarity. This is automatically correct when using the serial receivers.)

Each of the statistics subdevs is able to produce events. An event is generated whenever a statistics buffer can be dequeued by a user space application using the VIDIOC_OMAP3ISP_STAT_REQ IOCTL. The events available are:

• V4L2_EVENT_OMAP3ISP_AEWB
• V4L2_EVENT_OMAP3ISP_AF
• V4L2_EVENT_OMAP3ISP_HIST

The type of the event data is struct omap3isp_stat_event_status for these ioctls. If there is an error calculating the statistics, there will be an event as usual, but no related statistics buffer. In this case omap3isp_stat_event_status.buf_err is set to non-zero.

4.17.5 Private IOCTLs

The OMAP 3 ISP driver supports standard V4L2 IOCTLs and controls where possible and practical. Much of the functions provided by the ISP, however, does not fall under the standard IOCTLs — gamma tables and configuration of statistics collection are examples of such.

In general, there is a private ioctl for configuring each of the blocks containing hardware-dependent functions.

The following private IOCTLs are supported:

• VIDIOC_OMAP3ISP_CCDC_CFG
• VIDIOC_OMAP3ISP_PRV_CFG
• VIDIOC_OMAP3ISP_AEWB_CFG

2 http://git.ideasonboard.org/?p=media-ctl.git;a=summary
• VIDIOC_OMAP3ISP_HIST_CFG
• VIDIOC_OMAP3ISP_AF_CFG
• VIDIOC_OMAP3ISP_STAT_REQ
• VIDIOC_OMAP3ISP_STAT_EN

The parameter structures used by these ioctls are described in include/linux/omap3isp.h. The detailed functions of the ISP itself related to a given ISP block is described in the Technical Reference Manuals (TRMs) — see the end of the document for those.

While it is possible to use the ISP driver without any use of these private IOCTLs it is not possible to obtain optimal image quality this way. The AEWB, AF and histogram modules cannot be used without configuring them using the appropriate private IOCTLs.

4.17.6 CCDC and preview block IOCTLs

The VIDIOC_OMAP3ISP_CCDC_CFG and VIDIOC_OMAP3ISP_PRV_CFG IOCTLs are used to configure, enable and disable functions in the CCDC and preview blocks, respectively. Both IOCTLs control several functions in the blocks they control. VIDIOC_OMAP3ISP_CCDC_CFG IOCTL accepts a pointer to struct omap3isp_ccdc_update_config as its argument. Similarly VIDIOC_OMAP3ISP_PRV_CFG accepts a pointer to struct omap3isp_prev_update_config. The definition of both structures is available in 1.

The update field in the structures tells whether to update the configuration for the specific function and the flag tells whether to enable or disable the function.

The update and flag bit masks accept the following values. Each separate functions in the CCDC and preview blocks is associated with a flag (either disable or enable; part of the flag field in the structure) and a pointer to configuration data for the function.

Valid values for the update and flag fields are listed here for VIDIOC_OMAP3ISP_CCDC_CFG. Values may be or’ed to configure more than one function in the same IOCTL call.

• OMAP3ISP_CCDC_ALAW
• OMAP3ISP_CCDC_LPF
• OMAP3ISP_CCDC_BLCLAMP
• OMAP3ISP_CCDC_BCOMP
• OMAP3ISP_CCDC_FPC
• OMAP3ISP_CCDC_CULL
• OMAP3ISP_CCDC_CONFIG_LSC
• OMAP3ISP_CCDC_TBL_LSC

The corresponding values for the VIDIOC_OMAP3ISP_PRV_CFG are here:

• OMAP3ISP_PREV_LUMAENH
• OMAP3ISP_PREV_INVALAW
• OMAP3ISP_PREV_HRZ_MED
• OMAP3ISP_PREV_CFA
• OMAP3ISP_PREV_CHROMA_SUPP
• OMAP3ISP_PREV_WB
• OMAP3ISP_PREV_BLKADJ
• OMAP3ISP_PREV_RGB2RGB
• OMAP3ISP_PREV_COLOR_CONV

1 include/linux/omap3isp.h
• OMAP3ISP_PREV_YC_LIMIT
• OMAP3ISP_PREV_DEFECT_COR
• OMAP3ISP_PREV_GAMMABYPASS
• OMAP3ISP_PREV_DRK_FRM_CAPTURE
• OMAP3ISP_PREV_DRK_FRM_SUBTRACT
• OMAP3ISP_PREV_LENS_SHADING
• OMAP3ISP_PREV_NF
• OMAP3ISP_PREV_GAMMA

The associated configuration pointer for the function may not be NULL when enabling the function. When disabling a function the configuration pointer is ignored.

4.17.7 Statistic blocks IOCTLs

The statistics subdevs do offer more dynamic configuration options than the other subdevs. They can be enabled, disable and reconfigured when the pipeline is in streaming state.

The statistics blocks always get the input image data from the CCDC (as the histogram memory read isn’t implemented). The statistics are dequeueable by the user from the statistics subdev nodes using private IOCTLs.

The private IOCTLs offered by the AEWB, AF and histogram subdevs are heavily reflected by the register level interface offered by the ISP hardware. There are aspects that are purely related to the driver implementation and these are discussed next.

4.17.8 VIDIOC_OMAP3ISP_STAT_EN

This private IOCTL enables/disables a statistic module. If this request is done before streaming, it will take effect as soon as the pipeline starts to stream. If the pipeline is already streaming, it will take effect as soon as the CCDC becomes idle.

4.17.9 VIDIOC_OMAP3ISP_AEWB_CFG, VIDIOC_OMAP3ISP_HIST_CFG and VIDIOC_OMAP3ISP_AF_CFG

Those IOCTLs are used to configure the modules. They require user applications to have an in-depth knowledge of the hardware. Most of the fields explanation can be found on OMAP’s TRMs. The two following fields common to all the above configure private IOCTLs require explanation for better understanding as they are not part of the TRM.

omap3isp_[h3a_af/h3a_aewb/hist]_config.buf_size:

The modules handle their buffers internally. The necessary buffer size for the module’s data output depends on the requested configuration. Although the driver supports reconfiguration while streaming, it does not support a reconfiguration which requires bigger buffer size than what is already internally allocated if the module is enabled. It will return -EBUSY on this case. In order to avoid such condition, either disable/reconfigure/enable the module or request the necessary buffer size during the first configuration while the module is disabled.

The internal buffer size allocation considers the requested configuration’s minimum buffer size and the value set on buf_size field. If buf_size field is out of [minimum, maximum] buffer size range, it’s clamped to fit in there. The driver then selects the biggest value. The corrected buf_size value is written back to user application.

omap3isp_[h3a_af/h3a_aewb/hist]_config.config_counter:
As the configuration doesn’t take effect synchronously to the request, the driver must provide a way to track this information to provide more accurate data. After a configuration is requested, the config_counter returned to user space application will be an unique value associated to that request. When user application receives an event for buffer availability or when a new buffer is requested, this config_counter is used to match a buffer data and a configuration.

4.17.10 VIDIOC_OMAP3ISP_STAT_REQ

Send to user space the oldest data available in the internal buffer queue and discards such buffer afterwards. The field omap3isp_stat_data.frame_number matches with the video buffer’s field_count.

4.18 OMAP4 ISS Driver

Author: Sergio Aguirre <sergio.a.aguirre@gmail.com>
Copyright (C) 2012, Texas Instruments

4.18.1 Introduction

The OMAP44XX family of chips contains the Imaging SubSystem (a.k.a. ISS), Which contains several components that can be categorized in 3 big groups:
- Interfaces (2 Interfaces: CSI2-A & CSI2-B/CCP2)
- ISP (Image Signal Processor)
- SIMCOP (Still Image Coprocessor)

For more information, please look in \[1\] for latest version of: “OMAP4430 Multimedia Device Silicon Revision 2.x”

As of Revision AB, the ISS is described in detail in section 8.

This driver is supporting only the CSI2-A/B interfaces for now.

It makes use of the Media Controller framework \[2\], and inherited most of the code from OMAP3 ISP driver (found under drivers/media/platform/omap3isp/*), except that it doesn’t need an IOMMU now for ISS buffers memory mapping.

Supports usage of MMAP buffers only (for now).

\[1\] http://focus.ti.com/general/docs/\[2\] http://lwn.net/Articles/420485/
4.18.2 Tested platforms

- OMAP4430SDP, w/ ES2.1 GP & SEVM4430-CAM-V1-0 (Contains IMX060 & OV5640, in which only the last one is supported, outputting YUV422 frames).
- TI Blaze MDP, w/ OMAP4430 ES2.2 EMU (Contains 1 IMX060 & 2 OV5650 sensors, in which only the OV5650 are supported, outputting RAW10 frames).
- PandaBoard, Rev. A2, w/ OMAP4430 ES2.1 GP & OV adapter board, tested with following sensors: * OV5640 * OV5650

PandaBoard, Rev. A2, w/ OMAP4430 ES2.1 GP & OV adapter board, tested with following sensors: * OV5640 * OV5650

- Tested on mainline kernel:

4.19 The pvrusb2 driver

Author: Mike Isely <isely@pobox.com>

4.19.1 Background

This driver is intended for the “Hauppauge WinTV PVR USB 2.0”, which is a USB 2.0 hosted TV Tuner. This driver is a work in progress. Its history started with the reverse-engineering effort by Björn Danielsson <pvrusb2@dax.nu> whose web page can be found here: http://pvrusb2.dax.nu/

From there Aurelien Alleaume <slts@free.fr> began an effort to create a video4linux compatible driver. I began with Aurelien’s last known snapshot and evolved the driver to the state it is in here.

More information on this driver can be found at: http://www.isely.net/pvrusb2.html

This driver has a strong separation of layers. They are very roughly:

1. Low level wire-protocol implementation with the device.
2. I2C adaptor implementation and corresponding I2C client drivers implemented elsewhere in V4L.
3. High level hardware driver implementation which coordinates all activities that ensure correct operation of the device.
4. A “context” layer which manages instancing of driver, setup, tear-down, arbitration, and interaction with high level interfaces appropriately as devices are hotplugged in the system.
5. High level interfaces which glue the driver to various published Linux APIs (V4L, sysfs, maybe DVB in the future).

The most important shearing layer is between the top 2 layers. A lot of work went into the driver to ensure that any kind of conceivable API can be laid on top of the core driver. (Yes, the driver internally leverages V4L to do its work but that really has nothing to do with the API published by the driver to the outside world.) The architecture allows for different APIs to simultaneously access the driver. I have a strong sense of fairness about APIs and also feel that it is a good design principle to keep implementation and interface isolated from each other. Thus while right now the V4L high level interface is the most complete, the sysfs high level interface will work equally well for similar functions, and there’s no reason I see right now why it shouldn’t be possible to produce a DVB high level interface that can sit right alongside V4L.
4.19.2 Building

To build these modules essentially amounts to just running “Make”, but you need the kernel source tree nearby and you will likely also want to set a few controlling environment variables first in order to link things up with that source tree. Please see the Makefile here for comments that explain how to do that.

4.19.3 Source file list / functional overview

(Note: The term “module” used below generally refers to loosely defined functional units within the pvrusb2 driver and bears no relation to the Linux kernel’s concept of a loadable module.)

pvrusb2-audio.[ch] - This is glue logic that resides between this driver and the msp3400.ko I2C client driver (which is found elsewhere in V4L).

pvrusb2-context.[ch] - This module implements the context for an instance of the driver. Everything else eventually ties back to or is otherwise instance within the data structures implemented here. Hotplugging is ultimately coordinated here. All high level interfaces tie into the driver through this module. This module helps arbitrate each interface’s access to the actual driver core, and is designed to allow concurrent access through multiple instances of multiple interfaces (thus you can for example change the tuner’s frequency through sysfs while simultaneously streaming video through V4L out to an instance of mplayer).

pvrusb2-debug.h - This header defines a printk() wrapper and a mask of debugging bit definitions for the various kinds of debug messages that can be enabled within the driver.

pvrusb2-debugifc.[ch] - This module implements a crude command line oriented debug interface into the driver. Aside from being part of the process for implementing manual firmware extraction (see the pvrusb2 web site mentioned earlier), probably I’m the only one who has ever used this. It is mainly a debugging aid.

pvrusb2-eeprom.[ch] - This is glue logic that resides between this driver the tveeprom.ko module, which is itself implemented elsewhere in V4L.

pvrusb2-debugifc.[ch] - This module implements all protocol needed to interact with the Conexant mpeg2 encoder chip within the pvrusb2 device. It is a crude echo of corresponding logic in ivtv, however the design goals (strict isolation) and physical layer (proxy through USB instead of PCI) are enough different that this implementation had to be completely different.

pvrusb2-hdw-internal.h - This header defines the core data structure in the driver used to track all internal state related to control of the hardware. Nobody outside of the core hardware-handling modules should have any business using this header. All external access to the driver should be through one of the high level interfaces (e.g. V4L, sysfs, etc), and in fact even those high level interfaces are restricted to the API defined in pvrusb2-hdw.h and NOT this header.

pvrusb2-hdw.h - This header defines the full internal API for controlling the hardware. High level interfaces (e.g. V4L, sysfs) will work through here.

pvrusb2-hdw.c - This module implements all the various bits of logic that handle overall control of a specific pvrusb2 device. (Policy, instantiation, and arbitration of pvrusb2 devices fall within the jurisdiction of pvrusb-context not here).

pvrusb2-i2c-chips-*.c - These modules implement the glue logic to tie together and configure various I2C modules as they attach to the I2C bus. There are two versions of this file. The “v4l2” version is intended to be used in-tree alongside V4L, where we implement just the logic that makes sense for a pure V4L environment. The “all” version is intended for use outside of V4L, where we might encounter other possibly “challenging” modules from ivtv or older kernel snapshots (or even the support modules in the standalone snapshot).

pvrusb2-i2c-cmd-v4l1.[ch] - This module implements generic V4L1 compatible commands to the I2C modules. It is here where state changes inside the pvrusb2 driver are translated into V4L1 commands that are in turn send to the various I2C modules.

4.19. The pvrusb2 driver
pvrusb2-i2c-cmd-v4l2.[ch] - This module implements generic V4L2 compatible commands to the I2C modules. It is here where state changes inside the pvrusb2 driver are translated into V4L2 commands that are in turn send to the various I2C modules.

pvrusb2-i2c-core.[ch] - This module provides an implementation of a kernel-friendly I2C adaptor driver, through which other external I2C client drivers (e.g. msp3400, tuner, lirc) may connect and operate corresponding chips within the pvrusb2 device. It is through here that other V4L modules can reach into this driver to operate specific pieces (and those modules are in turn driven by glue logic which is coordinated by pvrusb2-hdw, doled out by pvrusb2-context, and then ultimately made available to users through one of the high level interfaces).

pvrusb2-io.[ch] - This module implements a very low level ring of transfer buffers, required in order to stream data from the device. This module is very low level. It only operates the buffers and makes no attempt to define any policy or mechanism for how such buffers might be used.

pvrusb2-ioread.[ch] - This module layers on top of pvrusb2-io.[ch] to provide a streaming API usable by a read() system call style of I/O. Right now this is the only layer on top of pvrusb2-io.[ch], however the underlying architecture here was intended to allow for other styles of I/O to be implemented with additional modules, like mmap()'ed buffers or something even more exotic.

pvrusb2-main.c - This is the top level of the driver. Module level and USB core entry points are here. This is our “main”.

pvrusb2-sysfs.[ch] - This is the high level interface which ties the pvrusb2 driver into sysfs. Through this interface you can do everything with the driver except actually stream data.

pvrusb2-tuner.[ch] - This is glue logic that resides between this driver and the tuner.ko I2C client driver (which is found elsewhere in V4L).

pvrusb2-util.h - This header defines some common macros used throughout the driver. These macros are not really specific to the driver, but they had to go somewhere.

pvrusb2-v4l2.[ch] - This is the high level interface which ties the pvrusb2 driver into video4linux. It is through here that V4L applications can open and operate the driver in the usual V4L ways. Note that ALL V4L functionality is published only through here and nowhere else.

pvrusb2-video-[x].[ch] - This is glue logic that resides between this driver and the saa711x.ko I2C client driver (which is found elsewhere in V4L). Note that saa711x.ko used to be known as saa7115.ko in ivtv. There are two versions of this; one is selected depending on the particular saa711[5x].ko that is found.

pvrusb2.h - This header contains compile time tunable parameters (and at the moment the driver has very little that needs to be tuned).

4.20 PXA-Camera Host Driver

Author: Robert Jarzmik <robert.jarzmik@free.fr>

4.20.1 Constraints

1. Image size for YUV422P format All YUV422P images are enforced to have width x height % 16 = 0. This is due to DMA constraints, which transfers only planes of 8 byte multiples.

4.20.2 Global video workflow

1. QCI stopped Initially, the QCI interface is stopped. When a buffer is queued (pxa_videoobuf_ops->buf_queue), the QCI starts.
2. QCI started More buffers can be queued while the QCI is started without halting the capture. The new buffers are “appended” at the tail of the DMA chain, and smoothly captured one frame after the other.

Once a buffer is filled in the QCI interface, it is marked as “DONE” and removed from the active buffers list. It can be then requeued or dequeued by userland application.

Once the last buffer is filled in, the QCI interface stops.

3. Capture global finite state machine schema

| Legend: - each box is a FSM state |
| - each arrow is the condition to transition to another state |
| - an arrow with a comment is a mandatory transition (no condition) |
| - arrow "Q" means : a buffer was enqueued |
| - arrow "DQ" means : a buffer was dequeued |
| - "QCI: stop" means the QCI interface is not enabled |
| - "DMA: stop" means all 3 DMA channels are stopped |
| - "DMA: run" means at least 1 DMA channel is still running |

4.20.3 DMA usage

1. DMA flow
• first buffer queued for capture Once a first buffer is queued for capture, the QCI is started, but data transfer is not started. On “End Of Frame” interrupt, the irq handler starts the DMA chain.

• capture of one videobuffer The DMA chain starts transferring data into videobuffer RAM pages. When all pages are transferred, the DMA irq is raised on “ENDINTR” status

• finishing one videobuffer The DMA irq handler marks the videobuffer as “done”, and removes it from the active running queue Meanwhile, the next videobuffer (if there is one), is transferred by DMA

• finishing the last videobuffer On the DMA irq of the last videobuffer, the QCI is stopped.

2. DMA prepared buffer will have this structure

```
+------------+-----+---------------+-----------------+
| desc-sg[0] | ... | desc-sg[last] | finisher/linker |
+------------+-----+---------------+-----------------+
```

This structure is pointed by dma->sg_cpu. The descriptors are used as follows:

• desc-sg[i]: i-th descriptor, transferring the i-th sg element to the video buffer scatter gather

• finisher: has ddadr=ADDR_STOP, dcmd=ENDIRQEN

• linker: has ddadr= desc-sg[0] of next video buffer, dcmd=0

For the next schema, let’s assume d0=desc-sg[0] .. dN=desc-sg[N], “f” stands for finisher and “l” for linker. A typical running chain is:

```
Videobuffer 1   Videobuffer 2
+---------+----+---+ +----+----+----+---+
| d0 | .. | dN | l | | d0 | .. | dN | f |
+---------+----+-|-+ ^----+----+----+-^-+
| | |
+----+ +----+
```

After the chaining is finished, the chain looks like:

```
Videobuffer 1   Videobuffer 2   Videobuffer 3
+---------+----+---+ +----+----+----+---+ +----+----+----+---+
| d0 | .. | dN | l | | d0 | .. | dN | l | | d0 | .. | dN | f |
+---------+----+-|-+ ^----+----+----+-^-+ ^----+----+----+---+
| | | |
+----+ +----+ new_link
```

3. DMA hot chaining timeslice issue

As DMA chaining is done while DMA _is_ running, the linking may be done while the DMA jumps from one Videobuffer to another. On the schema, that would be a problem if the following sequence is encountered:

• DMA chain is Videobuffer1 + Videobuffer2

• pxa_videobuf_queue() is called to queue Videobuffer3

• DMA controller finishes Videobuffer2, and DMA stops

```
=> Videobuffer 1   Videobuffer 2
+---------+----+---+ +----+----+----+---+ +----+-----+
| d0 | .. | dN | l | | d0 | .. | dN | f |
+---------+----+-|-+ ^----+----+----+-^-+ +--- DMA DDADR loads DDADR_STOP
```
• `pxa_dma_add_tail_buf()` is called, the Videobuffer2 “finisher” is replaced by a “linker” to Videobuffer3 (creation of new_link)
• `pxa_videobuf_queue()` finishes
• the DMA irq handler is called, which terminates Videobuffer2
• Videobuffer3 capture is not scheduled on DMA chain (as it stopped !!!)

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Videobuffer 1</td>
<td>Videobuffer 2</td>
<td>Videobuffer 3</td>
</tr>
<tr>
<td>+---------+----+---+</td>
<td>+----+----+----+---+</td>
<td>+----+----+----+---+</td>
</tr>
<tr>
<td></td>
<td>d0</td>
<td>..</td>
</tr>
<tr>
<td>+---------+----+-</td>
<td>-+</td>
<td>^----+----+----+-</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>+----+ +----+</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

`DMA DDADR still is DDADR_STOP`

• `pxa_camera_check_link_miss()` is called This checks if the DMA is finished and a buffer is still on the pcd->capture list. If that’s the case, the capture will be restarted, and Videobuffer3 is scheduled on DMA chain.
• the DMA irq handler finishes

**Note:**

If DMA stops just after `pxa_camera_check_link_miss()` reads DDADR() value, we have the guarantee that the DMA irq handler will be called back when the DMA will finish the buffer, and `pxa_camera_check_link_miss()` will be called again, to reschedule Videobuffer3.

### 4.21 The Radiotrack radio driver

**Author:** Stephen M. Benoit <benoits@servicepro.com>  
**Date:** Dec 14, 1996

#### 4.21.1 ACKNOWLEDGMENTS

This document was made based on ‘C’ code for Linux from Gideon le Grange ([legrang@active.co.za](mailto:legrang@active.co.za) or [legrang@cs.sun.ac.za](mailto:legrang@cs.sun.ac.za)) in 1994, and elaborations from Frans Brinkman ([brinkman@esd.nl](mailto:brinkman@esd.nl)) in 1996. The results reported here are from experiments that the author performed on his own setup, so your mileage may vary... I make no guarantees, claims or warranties to the suitability or validity of this information. No other documentation on the AIMS Lab ([http://www.aimslab.com/](http://www.aimslab.com/)) RadioTrack card was made available to the author. This document is offered in the hopes that it might help users who want to use the RadioTrack card in an environment other than MS Windows.

#### 4.21.2 WHY THIS DOCUMENT?

I have a RadioTrack card from back when I ran an MS-Windows platform. After converting to Linux, I found Gideon le Grange’s command-line software for running the card, and found that it was good! Frans Brinkman made a comfortable X-windows interface, and added a scanning feature. For hack value, I wanted to see if the tuner could be tuned beyond the usual FM radio broadcast band, so I could pick up the audio carriers from North American broadcast TV channels, situated just below and above the 87.0-109.0 MHz range. I did not get much success, but I learned about programming ioports under Linux and gained some insights about the hardware design used for the card.

So, without further delay, here are the details.
4.21.3 PHYSICAL DESCRIPTION

The RadioTrack card is an ISA 8-bit FM radio card. The radio frequency (RF) input is simply an antenna lead, and the output is a power audio signal available through a miniature phone plug. Its RF frequencies of operation are more or less limited from 87.0 to 109.0 MHz (the commercial FM broadcast band). Although the registers can be programmed to request frequencies beyond these limits, experiments did not give promising results. The variable frequency oscillator (VFO) that demodulates the intermediate frequency (IF) signal probably has a small range of useful frequencies, and wraps around or gets clipped beyond the limits mentioned above.

4.21.4 CONTROLLING THE CARD WITH IOPORT

The RadioTrack (base) ioport is configurable for 0x30c or 0x20c. Only one ioport seems to be involved. The ioport decoding circuitry must be pretty simple, as individual ioport bits are directly matched to specific functions (or blocks) of the radio card. This way, many functions can be changed in parallel with one write to the ioport. The only feedback available through the ioports appears to be the “Stereo Detect” bit.

The bits of the ioport are arranged as follows:

<table>
<thead>
<tr>
<th>MSh</th>
<th>LSb</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VolA</td>
<td>VolB</td>
<td>????</td>
</tr>
<tr>
<td>(+)</td>
<td>(-)</td>
<td>Detect</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Enable</td>
</tr>
<tr>
<td>+</td>
<td>+</td>
<td>+</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>VolA</th>
<th>VolB</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>audio mute</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>volume + (some delay required)</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>volume - (some delay required)</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>stay at present volume</td>
</tr>
</tbody>
</table>

Stereo Detect Enable Description

<table>
<thead>
<tr>
<th>0</th>
<th>No Detect</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Detect</td>
</tr>
</tbody>
</table>

Results available by reading ioport >60 msec after last port write.

0xff ==> no stereo detected, 0xfd ==> stereo detected.

<table>
<thead>
<tr>
<th>Radio to Audio (path) Enable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Disable path (silence)</td>
</tr>
<tr>
<td>1</td>
<td>Enable path (audio produced)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>TuneA</th>
<th>TuneB</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>&quot;zero&quot; bit phase 1</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>&quot;zero&quot; bit phase 2</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>&quot;one&quot; bit phase 1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>&quot;one&quot; bit phase 2</td>
</tr>
</tbody>
</table>

24-bit code, where bits = (freq*40) + 10486188. The Most Significant 11 bits must be 1010 xxxx 0x0 to be valid. The bits are shifted in LSb first.

<table>
<thead>
<tr>
<th>Tune Update Enable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Tuner held constant</td>
</tr>
<tr>
<td>1</td>
<td>Tuner updating in progress</td>
</tr>
</tbody>
</table>
### 4.21.5 Programming Examples

<table>
<thead>
<tr>
<th>Default:</th>
<th>BASE &lt;- 0xc8 (current volume, no stereo detect, radio enable, tuner adjust disable)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Card Off:</td>
<td>BASE &lt;- 0x00 (audio mute, no stereo detect, radio disable, tuner adjust disable)</td>
</tr>
<tr>
<td>Card On:</td>
<td>BASE &lt;- 0x00 (see &quot;Card Off&quot;, clears any unfinished business)</td>
</tr>
<tr>
<td></td>
<td>BASE &lt;- 0xc8 (see &quot;Default&quot;)</td>
</tr>
<tr>
<td>Volume Down:</td>
<td>BASE &lt;- 0x48 (volume down, no stereo detect, radio enable, tuner adjust disable)</td>
</tr>
<tr>
<td></td>
<td>wait 10 msec</td>
</tr>
<tr>
<td></td>
<td>BASE &lt;- 0xc8 (see &quot;Default&quot;)</td>
</tr>
<tr>
<td>Volume Up:</td>
<td>BASE &lt;- 0x88 (volume up, no stereo detect, radio enable, tuner adjust disable)</td>
</tr>
<tr>
<td></td>
<td>wait 10 msec</td>
</tr>
<tr>
<td></td>
<td>BASE &lt;- 0xc8 (see &quot;Default&quot;)</td>
</tr>
<tr>
<td>Check Stereo:</td>
<td>BASE &lt;- 0xd8 (current volume, stereo detect, radio enable, tuner adjust disable)</td>
</tr>
<tr>
<td></td>
<td>wait 100 msec</td>
</tr>
<tr>
<td></td>
<td>x &lt;- BASE (read ioport)</td>
</tr>
<tr>
<td></td>
<td>BASE &lt;- 0xc8 (see &quot;Default&quot;)</td>
</tr>
<tr>
<td></td>
<td>if x=0xff: &quot;not stereo&quot;, if x=0xfd: &quot;stereo detected&quot;</td>
</tr>
</tbody>
</table>

Set Frequency:

```
code = (freq*40) + 10486188
```

foreach of the 24 bits in code, (from Least to Most Significant):

to write a "zero" bit,

```
BASE <- 0x01 (audio mute, no stereo detect, radio disable, "zero" bit phase 1, tuner adjust)
BASE <- 0x03 (audio mute, no stereo detect, radio disable, "zero" bit phase 2, tuner adjust)
```

to write a "one" bit,

```
BASE <- 0x05 (audio mute, no stereo detect, radio disable, "one" bit phase 1, tuner adjust)
BASE <- 0x07 (audio mute, no stereo detect, radio disable, "one" bit phase 2, tuner adjust)
```

### 4.22 The saa7134 Driver

Author Gerd Hoffmann

This is a v4l2/oss device driver for saa7130/33/34/35 based capture / TV boards. See [http://www.semiconductors.philips.com/pip/saa7134hl](http://www.semiconductors.philips.com/pip/saa7134hl) for a description.

#### 4.22.1 Status

Almost everything is working. video, sound, tuner, radio, mpeg ts, ...

As with bttv, card-specific tweaks are needed. Check CARDLIST for a list of known TV cards and saa7134-cards.c for the drivers card configuration info.
4.22.2 Build

Pick up videodev + v4l2 patches from http://bytesex.org/patches/. Configure, build, install + boot the new kernel. You’ll need at least these config options:

```
CONFIG_I2C=m
CONFIG_VIDEO_DEV=m
```

Type “make” to build the driver now. “make install” installs the driver. “modprobe saa7134” should load it. Depending on the card you might have to pass card=<nr> as insmod option, check CARDLIST for valid choices.

4.22.3 Changes / Fixes

Please mail me unified diffs (“diff -u”) with your changes, and don’t forget to tell me what it changes / which problem it fixes / whatever it is good for ...

4.22.4 Known Problems

- The tuner for the flyvideos isn’t detected automatically and the default might not work for you depending on which version you have. There is a tuner= insmod option to override the driver’s default.

4.22.5 Card Variations:

Cards can use either of these two crystals (xtal):

- 32.11 MHz -> .audio_clock=0x187de7
- 24.576MHz -> .audio_clock=0x200000 (xtal * .audio_clock = 51539600)

Some details about 30/34/35:

- saa7130 - low-price chip, doesn’t have mute, that is why all those cards should have .mute field defined in their tuner structure.
- saa7134 - usual chip
- saa7133/35 - saa7135 is probably a marketing decision, since all those chips identifies itself as 33 on pci.

4.22.6 LifeView GPIOs

4.23 Cropping and Scaling algorithm, used in the sh_mobile_ceu_camera driver

Author: Guennadi Liakhovetski <g.liakhovetski@gmx.de>

4.23.1 Terminology

sensor scales: horizontal and vertical scales, configured by the sensor driver host scales: -“- host driver combined scales: sensor_scale * host_scale

4.23.2 Generic scaling / cropping scheme

```
-1- 
 | 
 2- - 
 | 3- 
 | 4- 
 5- . 6- 7- 
 | . . 8- 
 | . . 
```

4.23. Cropping and Scaling algorithm, used in the sh_mobile_ceu_camera driver
In the above chart minuses and slashes represent “real” data amounts, points and accents represent “useful” data, basically, CEU scaled and cropped output, mapped back onto the client’s source plane.

Such a configuration can be produced by user requests:

S_CROP(left / top = (5) - (1), width / height = (5') - (5)) S_FMT(width / height = (6') - (6))

Here:

(1) to (1') - whole max width or height (1) to (2) - sensor cropped left or top (2) to (2') - sensor cropped width or height (3) to (3') - sensor scale (3) to (4) - CEU cropped left or top (4) to (4') - CEU cropped width or height (5) to (5') - reverse sensor scale applied to CEU cropped width or height (2) to (5) - reverse sensor scale applied to CEU cropped left or top (6) to (6') - CEU scale - user window

4.23.3 S_FMT

Do not touch input rectangle - it is already optimal.

1. Calculate current sensor scales:
   
   \[
   \text{scale}_s = \frac{(2') - (2)}{(3') - (3)}
   \]

2. Calculate “effective” input crop (sensor subwindow) - CEU crop scaled back at current sensor scales onto input window - this is user S_CROP:

   \[
   \text{width}_u = (5') - (5) = \left(\frac{(4') - (4)}{(6') - (6)}\right) \cdot \text{scale}_s
   \]

3. Calculate new combined scales from “effective” input window to requested user window:

   \[
   \text{scale}_\text{comb} = \frac{\text{width}_u}{(6') - (6)}
   \]

4. Calculate sensor output window by applying combined scales to real input window:

   \[
   \text{width}_\text{s_out} = \left(\frac{(7') - (7)}{(2') - (2)}\right) = \frac{(2') - (2)}{\text{scale}_\text{comb}}
   \]

5. Apply iterative sensor S_FMT for sensor output window.

   \[
   \text{subdev}->\text{video_ops}->\text{s_fmt}(\text{.width} = \text{width}_\text{s_out})
   \]

6. Retrieve sensor output window (g_fmt)

7. Calculate new sensor scales:

   \[
   \text{scale}_\text{s_new} = \frac{(3')_\text{new} - (3)_\text{new}}{(2') - (2)}
   \]

8. Calculate new CEU crop - apply sensor scales to previously calculated “effective” crop:

   \[
   \text{width}_\text{ceu} = \left(\frac{(4')_\text{new} - (4)_\text{new}}{(5') - (5)}\right) = \frac{\text{width}_u}{\text{scale}_\text{s_new}}
   \]

9. Use CEU cropping to crop to the new window:

   \[
   \text{ceu_crop}(\text{.width} = \text{width}_\text{ceu}, \text{.left} = \text{left}_\text{ceu})
   \]

10. Use CEU scaling to scale to the requested user window:

    \[
    \text{scale}_\text{ceu} = \frac{\text{width}_\text{ceu}}{\text{width}}
    \]
4.23.4 S_CROP

The API at http://v4l2spec.bytesex.org/spec/x1904.htm says:

"...specification does not define an origin or units. However by convention drivers should horizontally count unscaled samples relative to 0H."

We choose to follow the advise and interpret cropping units as client input pixels.

Cropping is performed in the following 6 steps:

1. Request exactly user rectangle from the sensor.
2. If smaller - iterate until a larger one is obtained. Result: sensor cropped to 2 : 2', target crop 5 : 5', current output format 6' - 6.
3. In the previous step the sensor has tried to preserve its output frame as good as possible, but it could have changed. Retrieve it again.
4. Sensor scaled to 3 : 3'. Sensor's scale is (2' - 2) / (3' - 3). Calculate intermediate window: 4' - 4 = (5' - 5) * (3' - 3) / (2' - 2)
5. Calculate and apply host scale = (6' - 6) / (4' - 4)
6. Calculate and apply host crop: 6 - 7 = (5 - 2) * (6' - 6) / (5' - 5)

4.24 The Silicon Labs Si470x FM Radio Receivers driver

Copyright © 2009 Tobias Lorenz <tobias.lorenz@gmx.net>

4.24.1 Information from Silicon Labs

Silicon Laboratories is the manufacturer of the radio ICs, that nowadays are the most often used radio receivers in cell phones. Usually they are connected with I2C. But SiLabs also provides a reference design, which integrates this IC, together with a small microcontroller C8051F321, to form a USB radio. Part of this reference design is also a radio application in binary and source code. The software also contains an automatic firmware upgrade to the most current version. Information on these can be downloaded here: http://www.silabs.com/usbradio

4.24.2 Supported ICs

The following ICs have a very similar register set, so that they are or will be supported somewhen by the driver:

- Si4700: FM radio receiver
- Si4701: FM radio receiver, RDS Support
- Si4702: FM radio receiver
- Si4703: FM radio receiver, RDS Support
- Si4704: FM radio receiver, no external antenna required
- Si4705: FM radio receiver, no external antenna required, RDS support, Dig I/O
- **Si4706: Enhanced FM RDS/TMC radio receiver, no external antenna required, RDS Support**
- Si4707: Dedicated weather band radio receiver with SAME decoder, RDS Support
- Si4708: Smallest FM receivers
- Si4709: Smallest FM receivers, RDS Support

---

4.24. The Silicon Labs Si470x FM Radio Receivers driver 979
More information on these can be downloaded here: [http://www.silabs.com/products/mcu/Pages/USBFMRadioRD.aspx](http://www.silabs.com/products/mcu/Pages/USBFMRadioRD.aspx)

### 4.24.3 Supported USB devices

Currently the following USB radios (vendor:product) with the Silicon Labs si470x chips are known to work:

- `10c4:818a`: Silicon Labs USB FM Radio Reference Design
- `1b80:d700`: KWorld USB FM Radio SnapMusic Mobile 700 (FM700)
- `10c5:819a`: Sanei Electric, Inc. FM USB Radio (sold as DealExtreme.com PCear)

### 4.24.4 Software

Testing is usually done with most application under Debian/testing:

- `fmtools`: Utility for managing FM tuner cards
- `gnomeradio`: FM-radio tuner for the GNOME desktop
- `gradio`: GTK FM radio tuner
- `kradio`: Comfortable Radio Application for KDE
- `radio`: ncurses-based radio application
- `mplayer`: The Ultimate Movie Player For Linux
- `v4l2-ctl`: Collection of command line video4linux utilities

For example, you can use:

```
v4l2-ctl -d /dev/radio0 --set-ctrl=volume=10,mute=0 --set-freq=95.21 --all
```

There is also a library `libv4l`, which can be used. It’s going to have a function for frequency seeking, either by using hardware functionality as in radio-si470x or by implementing a function as we currently have in every of the mentioned programs. Somewhen the radio programs should make use of `libv4l`.

For processing RDS information, there is a project ongoing at: [http://rdsd.berlios.de/](http://rdsd.berlios.de/)

There is currently no project for making TMC sentences human readable.

### 4.24.5 Audio Listing

USB Audio is provided by the ALSA `snd_usb_audio` module. It is recommended to also select `SND_USB_AUDIO`, as this is required to get sound from the radio. For listing you have to redirect the sound, for example using one of the following commands. Please adjust the audio devices to your needs (`/dev/dsp*` and `hw:x,x`).

If you just want to test audio (very poor quality):

```
cat /dev/dsp1 > /dev/dsp
```

If you use `sox` + OSS try:

```
sox -2 --endian little -r 96000 -t oss /dev/dsp1 -t oss /dev/dsp
```

or using `sox` + `alsa`:

```
sox --endian little -c 2 -S -r 96000 -t alsa hw:1 -t alsa -r 96000 hw:0
```
If you use arts try:

```
arecord -D hw:1,0 -r96000 -c2 -f S16_LE | artsdsp aplay -B -
```

If you use mplayer try:

```
mplayer -radio adevice=hw=1.0:arate=96000 \\
-rawaudio rate=96000 \\
radio://<frequency>/capture
```

### 4.24.6 Module Parameters

After loading the module, you still have access to some of them in the sysfs mount under /sys/module/radio_si470x/parameters. The contents of read-only files (0444) are not updated, even if space, band and de are changed using private video controls. The others are runtime changeable.

### 4.24.7 Errors

Increase tune_timeout, if you often get -EIO errors.

When timed out or band limit is reached, hw_freq_seek returns -EAGAIN.

If you get any errors from snd_usb_audio, please report them to the ALSA people.

### 4.24.8 Open Issues

V4L minor device allocation and parameter setting is not perfect. A solution is currently under discussion.

There is an USB interface for downloading/uploading new firmware images. Support for it can be implemented using the request_firmware interface.

There is a RDS interrupt mode. The driver is already using the same interface for polling RDS information, but is currently not using the interrupt mode.

There is a LED interface, which can be used to override the LED control programmed in the firmware. This can be made available using the LED support functions in the kernel.

### 4.24.9 Other useful information and links

http://www.silabs.com/usbradio

### 4.25 The Silicon Labs Si4713 FM Radio Transmitter Driver

Copyright © 2009 Nokia Corporation

Contact: Eduardo Valentin <eduardo.valentin@nokia.com>

### 4.25.1 Information about the Device

This chip is a Silicon Labs product. It is a I2C device, currently on 0x63 address. Basically, it has transmission and signal noise level measurement features.

The Si4713 integrates transmit functions for FM broadcast stereo transmission. The chip also allows integrated receive power scanning to identify low signal power FM channels.
The chip is programmed using commands and responses. There are also several properties which can change the behavior of this chip.

Users must comply with local regulations on radio frequency (RF) transmission.

### 4.25.2 Device driver description

There are two modules to handle this device. One is a I2C device driver and the other is a platform driver.

The I2C device driver exports a v4l2-subdev interface to the kernel. All properties can also be accessed by v4l2 extended controls interface, by using the v4l2-subdev calls (g_extCtrls, s_extCtrls).

The platform device driver exports a v4l2 radio device interface to user land. So, it uses the I2C device driver as a sub device in order to send the user commands to the actual device. Basically it is a wrapper to the I2C device driver.

Applications can use v4l2 radio API to specify frequency of operation, mute state, etc. But mostly of its properties will be present in the extended controls.

When the v4l2 mute property is set to 1 (true), the driver will turn the chip off.

### 4.25.3 Properties description

The properties can be accessed using v4l2 extended controls. Here is an output from v4l2-ctl util:

```bash
/ # v4l2-ctl -d /dev/radio0 --all -L
Driver Info:
    Driver name     : radio-si4713
    Card type       : Silicon Labs Si4713 Modulator
    Bus info        : 
    Driver version  : 0
    Capabilities    : 0x00080800

RDS Output
    Modulator:
        Name        : FM Modulator
        Capabilities: 62.5 Hz stereo rds
        Frequency range: 76.0 MHz - 108.0 MHz
        Subchannel modulation: stereo+rds

User Controls
    mute (bool) : default=1 value=0

FM Radio Modulator Controls
    rds_signal_deviation (int) : min=0 max=90000 step=10 default=200 value=200 flags=slider
    rds_program_id (int) : min=0 max=65535 step=1 default=0 value=0
    rds_program_type (int) : min=0 max=31 step=1 default=0 value=0
    rds_ps_name (str) : min=0 max=96 step=8 value='si4713'
    rds_radio_text (str) : min=0 max=384 step=32 value=''
    audio_limiter_feature_enabled (bool) : default=1 value=1
    audio_limiter_release_time (int) : min=250 max=102390 step=50 default=5010 value=5010
    audio_limiter_deviation (int) : min=0 max=90000 step=10 default=66250 value=66250
    audio_compression_feature_enable (bool) : default=1 value=1
    audio_compression_gain (int) : min=0 max=20 step=1 default=15 value=15 flags=slider
    audio_compression_threshold (int) : min=-40 max=0 step=1 default=-40 value=-40 flags=slider
```
Here is a summary of them:

- **Pilot** is an audible tone sent by the device.
- **pilot_frequency** - Configures the frequency of the stereo pilot tone.
- **pilot_deviation** - Configures pilot tone frequency deviation level.
- **pilot_enabled** - Enables or disables the pilot tone feature.
- The si4713 device is capable of applying audio compression to the transmitted signal.
  - **acomp_enabled** - Enables or disables the audio dynamic range control feature.
  - **acomp_gain** - Sets the gain for audio dynamic range control.
  - **acomp_threshold** - Sets the threshold level for audio dynamic range control.
  - **acomp_attack_time** - Sets the attack time for audio dynamic range control.
  - **acomp_release_time** - Sets the release time for audio dynamic range control.
- Limiter setups audio deviation limiter feature. Once a over deviation occurs, it is possible to adjust the front-end gain of the audio input and always prevent over deviation.
  - **limiter_enabled** - Enables or disables the limiter feature.
  - **limiter_deviation** - Configures audio frequency deviation level.
  - **limiter_release_time** - Sets the limiter release time.
- **Tuning power**
  - **power_level** - Sets the output power level for signal transmission.
  - **antenna_capacitor** - This selects the value of antenna tuning capacitor manually or automatically if set to zero.

- **RDS related**
  - **rds_ps_name** - Sets the RDS ps name field for transmission.
  - **rds_radio_text** - Sets the RDS radio text for transmission.
  - **rds_pi** - Sets the RDS PI field for transmission.
  - **rds_pty** - Sets the RDS PTY field for transmission.
- **Region related**
  - **preemphasis** - sets the preemphasis to be applied for transmission.

### 4.25.4 RNL

This device also has an interface to measure received noise level. To do that, you should ioctl the device node. Here is an example code:
```c
int main (int argc, char *argv[]) {
    struct si4713_rnl rnl;
    int fd = open("/dev/radio0", O_RDWR);
    int rval;
    if (argc < 2)
        return -EINVAL;
    if (fd < 0)
        return fd;
    sscanf(argv[1], "%d", &rnl.frequency);
    rval = ioctl(fd, SI4713_IOC_MEASURE_RNL, &rnl);
    if (rval < 0)
        return rval;
    printf("received noise level: %d\n", rnl.rnl);
    close(fd);
}
```

The `struct si4713_rnl` and `SI4713_IOC_MEASURE_RNL` are defined under `include/linux/platform_data/media/si4713.h`.

### 4.25.5 Stereo/Mono and RDS subchannels

The device can also be configured using the available sub channels for transmission. To do that use `S/G_MODULATOR ioctl` and configure txsubchans properly. Refer to the V4L2 API specification for proper use of this ioctl.

### 4.25.6 Testing

Testing is usually done with v4l2-ctl utility for managing FM tuner cards. The tool can be found in v4l-dvb repository under v4l2-apps/util directory.

Example for setting rds ps name:

```bash
# v4l2-ctl -d /dev/radio0 --set-ctrl=rds_ps_name="Dummy"
```

### 4.26 The SI476x Driver

Copyright © 2013 Andrey Smirnov <andrew.smirnov@gmail.com>

#### 4.26.1 TODO for the driver

- According to the SiLabs’ datasheet it is possible to update the firmware of the radio chip in the runtime, thus bringing it to the most recent version. Unfortunately I couldn’t find any mentioning of the said firmware update for the old chips that I tested the driver against, so for chips like that the driver only exposes the old functionality.
4.26.2 Parameters exposed over debugfs

SI476x allow user to get multiple characteristics that can be very useful for EoL testing/RF performance estimation, parameters that have very little to do with V4L2 subsystem. Such parameters are exposed via debugfs and can be accessed via regular file I/O operations.

The drivers exposes following files:

- /sys/kernel/debug/<device-name>/acf This file contains ACF(Automatically Controlled Features) status information. The contents of the file is binary data of the following layout:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>blend_int</td>
<td>Flag, set when stereo separation has crossed below the blend threshold</td>
</tr>
<tr>
<td>0x01</td>
<td>hblend_int</td>
<td>Flag, set when HiBlend cutoff frequency is lower than threshold</td>
</tr>
<tr>
<td>0x02</td>
<td>hicut_int</td>
<td>Flag, set when HiCut cutoff frequency is lower than threshold</td>
</tr>
<tr>
<td>0x03</td>
<td>chbw_int</td>
<td>Flag, set when channel filter bandwidth is less than threshold</td>
</tr>
<tr>
<td>0x04</td>
<td>softmute_int</td>
<td>Flag indicating that softmute attenuation has increased above softmute threshold</td>
</tr>
<tr>
<td>0x05</td>
<td>smute</td>
<td>0 - Audio is not soft muted 1 - Audio is soft muted</td>
</tr>
<tr>
<td>0x06</td>
<td>smattn</td>
<td>Soft mute attenuation level in dB</td>
</tr>
<tr>
<td>0x07</td>
<td>chbw</td>
<td>Channel filter bandwidth in kHz</td>
</tr>
<tr>
<td>0x08</td>
<td>hicut</td>
<td>HiCut cutoff frequency in units of 100Hz</td>
</tr>
<tr>
<td>0x09</td>
<td>hiblend</td>
<td>HiBlend cutoff frequency in units of 100 Hz</td>
</tr>
<tr>
<td>0x10</td>
<td>pilot</td>
<td>0 - Stereo pilot is not present 1 - Stereo pilot is present</td>
</tr>
<tr>
<td>0x11</td>
<td>stblend</td>
<td>Stereo blend in %</td>
</tr>
</tbody>
</table>

- /sys/kernel/debug/<device-name>/rds_blckcnt This file contains statistics about RDS receptions. Its binary data has the following layout:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>expected</td>
<td>Number of expected RDS blocks</td>
</tr>
<tr>
<td>0x02</td>
<td>received</td>
<td>Number of received RDS blocks</td>
</tr>
<tr>
<td>0x04</td>
<td>uncorrectable</td>
<td>Number of uncorrectable RDS blocks</td>
</tr>
</tbody>
</table>

- /sys/kernel/debug/<device-name>/agc This file contains information about parameters pertaining to AGC(Automatic Gain Control).

The layout is:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>mxhi</td>
<td>0 - FM Mixer PD high threshold is not tripped 1 - FM Mixer PD high threshold is tripped</td>
</tr>
<tr>
<td>0x01</td>
<td>mxlo</td>
<td>ditto for FM Mixer PD low</td>
</tr>
<tr>
<td>0x02</td>
<td>lnahi</td>
<td>ditto for FM LNA PD high</td>
</tr>
<tr>
<td>0x03</td>
<td>lnalo</td>
<td>ditto for FM LNA PD low</td>
</tr>
<tr>
<td>0x04</td>
<td>fmagc1</td>
<td>FMAGC1 attenuator resistance (see datasheet for more detail)</td>
</tr>
<tr>
<td>0x05</td>
<td>fmagc2</td>
<td>ditto for FMAGC2</td>
</tr>
<tr>
<td>0x06</td>
<td>pgagain</td>
<td>PGA gain in dB</td>
</tr>
<tr>
<td>0x07</td>
<td>fmwblang</td>
<td>FM/WB LNA Gain in dB</td>
</tr>
</tbody>
</table>

- /sys/kernel/debug/<device-name>/rsq This file contains information about parameters pertaining to RSQ(Received Signal Quality).

The layout is:
<table>
<thead>
<tr>
<th>Offset</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>multhint</td>
<td>0 - multipath value has not crossed the Multipath high threshold 1 - multipath value has crossed the Multipath high threshold</td>
</tr>
<tr>

</table>

- /sys/kernel/debug/<device-name>/rsq_primary This file contains information about parameters pertaining to RSQ(Received Signal Quality) for primary tuner only. Layout is as the one above.

### 4.27 The Soc-Camera Drivers

Author: Guennadi Liakhovetski <g.liakhovetski@gmx.de>

#### 4.27.1 Terminology

The following terms are used in this document:

- **camera / camera device / camera sensor** - a video-camera sensor chip, capable of connecting to a variety of systems and interfaces, typically uses i2c for control and configuration, and a parallel or a serial bus for data.

- **camera host** - an interface, to which a camera is connected. Typically a specialised interface, present on many SoCs, e.g. PXA27x and PXA3xx, SuperH, AVR32, i.MX27, i.MX31.

- **camera host bus** - a connection between a camera host and a camera. Can be parallel or serial, consists of data and control lines, e.g. clock, vertical and horizontal synchronization signals.
4.27.2 Purpose of the soc-camera subsystem

The soc-camera subsystem initially provided a unified API between camera host drivers and camera sensor drivers. Later the soc-camera sensor API has been replaced with the V4L2 standard subdev API. This also made camera driver re-use with non-soc-camera hosts possible. The camera host API to the soc-camera core has been preserved.

Soc-camera implements a V4L2 interface to the user, currently only the “mmap” method is supported by host drivers. However, the soc-camera core also provides support for the “read” method.

The subsystem has been designed to support multiple camera host interfaces and multiple cameras per interface, although most applications have only one camera sensor.

4.27.3 Existing drivers

As of 3.7 there are seven host drivers in the mainline: atmel-isi.c, mx1_camera.c (broken, scheduled for removal), mx2_camera.c, mx3_camera.c, omap1_camera.c, pxa_camera.c, sh_mobile_ceu_camera.c, and multiple sensor drivers under drivers/media/i2c/soc_camera/.

4.27.4 Camera host API

A host camera driver is registered using the

```
soc_camera_host_register(struct soc_camera_host *);
```

function. The host object can be initialized as follows:

```c
struct soc_camera_host *ici;
ici->drv_name = DRV_NAME;
ici->ops = &camera_host_ops;
ici->priv = pcdev;
ici->v4l2_dev.dev = &pdev->dev;
ici->nr = pdev->id;
```

All camera host methods are passed in a struct soc_camera_host_ops:

```c
static struct soc_camera_host_ops camera_host_ops = {
    .owner = THIS_MODULE,
    .add = camera_add_device,
    .remove = camera_remove_device,
    .set_fmt = camera_set_fmt_cap,
    .try_fmt = camera_try_fmt_cap,
    .init_videobuf2 = camera_init_videobuf2,
    .poll = camera_poll,
    .querycap = camera_querycap,
    .set_bus_param = camera_set_bus_param,
    /* The rest of host operations are optional */
};
```

.add and .remove methods are called when a sensor is attached to or detached from the host. .set_bus_param is used to configure physical connection parameters between the host and the sensor. .init_videobuf2 is called by soc-camera core when a video-device is opened, the host driver would typically call vb2_queue_init() in this method. Further video-buffer management is implemented completely by the specific camera host driver. If the host driver supports non-standard pixel format conversion, it should implement a .get_formats and, possibly, a .put_formats operations. See below for more details about format conversion. The rest of the methods are called from respective V4L2 operations.
4.27.5 Camera API

Sensor drivers can use struct soc_camera_link, typically provided by the platform, and used to specify to which camera host bus the sensor is connected, and optionally provide platform .power and .reset methods for the camera. This struct is provided to the camera driver via the I2C client device platform data and can be obtained, using the soc_camera_i2c_to_link() macro. Care should be taken, when using soc_camera_vdev_to_subdev() and when accessing struct soc_camera_device, using v4l2_get_subdev_hostdata(): both only work, when running on an soc-camera host. The actual camera driver operation is implemented using the V4L2 subdev API. Additionally soc-camera camera drivers can use auxiliary soc-camera helper functions like soc_camera_power_on() and soc_camera_power_off(), which switch regulators, provided by the platform and call board-specific power switching methods. soc_camera_apply_board_flags() takes camera bus configuration capability flags and applies any board transformations, e.g. signal polarity inversion. soc_mbus_get_fmdesc() can be used to obtain a pixel format descriptor, corresponding to a certain media-bus pixel format code. soc_camera_limit_side() can be used to restrict beginning and length of a frame side, based on camera capabilities.

4.27.6 VIDIOC_S_CROP and VIDIOC_S_FMT behaviour

Above user ioctls modify image geometry as follows:

VIDIOC_S_CROP: sets location and sizes of the sensor window. Unit is one sensor pixel. Changing sensor window sizes preserves any scaling factors, therefore user window sizes change as well.

VIDIOC_S_FMT: sets user window. Should preserve previously set sensor window as much as possible by modifying scaling factors. If the sensor window cannot be preserved precisely, it may be changed too.

In soc-camera there are two locations, where scaling and cropping can take place: in the camera driver and in the host driver. User ioctls are first passed to the host driver, which then generally passes them down to the camera driver. It is more efficient to perform scaling and cropping in the camera driver to save camera bus bandwidth and maximise the framerate. However, if the camera driver failed to set the required parameters with sufficient precision, the host driver may decide to also use its own scaling and cropping to fulfill the user’s request.

Camera drivers are interfaced to the soc-camera core and to host drivers over the v4l2-subdev API, which is completely functional, it doesn’t pass any data. Therefore all camera drivers shall reply to .g_fmt() requests with their current output geometry. This is necessary to correctly configure the camera bus. .s_fmt() and .try_fmt() have to be implemented too. Sensor window and scaling factors have to be maintained by camera drivers internally. According to the V4L2 API all capture drivers must support the VIDIOC_CROPCAP ioctl, hence we rely on camera drivers implementing .cropcap(). If the camera driver does not support cropping, it may choose to not implement .s_crop(), but to enable cropping support by the camera host driver at least the .g_crop method must be implemented.

User window geometry is kept in .user_width and .user_height fields in struct soc_camera_device and used by the soc-camera core and host drivers. The core updates these fields upon successful completion of a .s_fmt() call, but if these fields change elsewhere, e.g. during .s_crop() processing, the host driver is responsible for updating them.

4.27.7 Format conversion

V4L2 distinguishes between pixel formats, as they are stored in memory, and as they are transferred over a media bus. Soc-camera provides support to conveniently manage these formats. A table of standard transformations is maintained by soc-camera core, which describes, what FOURCC pixel format will be obtained, if a media-bus pixel format is stored in memory according to certain rules. E.g. if MEDIA_BUS_FMT_YUYV8_2X8 data is sampled with 8 bits per sample and stored in memory in the little-endian order with no gaps between bytes, data in memory will represent the V4L2_PIX_FMT_YUYV FOURCC format. These standard transformations will be used by soc-camera or by camera host drivers to configure camera drivers to produce the FOURCC format, requested by the user, using the VIDIOC_S_FMT ioctl(). Apart from those standard format conversions, host drivers can also provide their own conversion rules by implementing a .get_formats and, if required, a .put_formats methods.
4.28 The Linux USB Video Class (UVC) driver

This file documents some driver-specific aspects of the UVC driver, such as driver-specific ioctls and implementation notes.

Questions and remarks can be sent to the Linux UVC development mailing list at linux-uvc-devel@lists.berlios.de.

4.28.1 Extension Unit (XU) support

Introduction

The UVC specification allows for vendor-specific extensions through extension units (XUs). The Linux UVC driver supports extension unit controls (XU controls) through two separate mechanisms:

- through mappings of XU controls to V4L2 controls
- through a driver-specific ioctl interface

The first one allows generic V4L2 applications to use XU controls by mapping certain XU controls onto V4L2 controls, which then show up during ordinary control enumeration.

The second mechanism requires uvcvideo-specific knowledge for the application to access XU controls but exposes the entire UVC XU concept to user space for maximum flexibility.

Both mechanisms complement each other and are described in more detail below.

Control mappings

The UVC driver provides an API for user space applications to define so-called control mappings at runtime. These allow for individual XU controls or byte ranges thereof to be mapped to new V4L2 controls. Such controls appear and function exactly like normal V4L2 controls (i.e. the stock controls, such as brightness, contrast, etc.). However, reading or writing of such a V4L2 controls triggers a read or write of the associated XU control.

The ioctl used to create these control mappings is called UVCIOC_CTRL_MAP. Previous driver versions (before 0.2.0) required another ioctl to be used beforehand (UVCIOC_CTRL_ADD) to pass XU control information to the UVC driver. This is no longer necessary as newer uvcvideo versions query the information directly from the device.

For details on the UVCIOC_CTRL_MAP ioctl please refer to the section titled “IOCTL reference” below.

3. Driver specific XU control interface

For applications that need to access XU controls directly, e.g. for testing purposes, firmware upload, or accessing binary controls, a second mechanism to access XU controls is provided in the form of a driver-specific ioctl, namely UVCIOC_CTRLQUERY.

A call to this ioctl allows applications to send queries to the UVC driver that directly map to the low-level UVC control requests.

In order to make such a request the UVC unit ID of the control’s extension unit and the control selector need to be known. This information either needs to be hardcoded in the application or queried using other ways such as by parsing the UVC descriptor or, if available, using the media controller API to enumerate a device’s entities.

Unless the control size is already known it is necessary to first make a UVC_GET_LEN requests in order to be able to allocate a sufficiently large buffer and set the buffer size to the correct value. Similarly, to find out whether UVC_GET_CUR or UVC_SET_CUR are valid requests for a given control, a UVC_GET_INFO request should be made. The bits 0 (GET supported) and 1 (SET supported) of the resulting byte indicate which requests are valid.
With the addition of the UVCIOC_CTRL_QUERY ioctl the UVCIOC_CTRL_GET and UVCIOC_CTRL_SET ioctls have become obsolete since their functionality is a subset of the former ioctl. For the time being they are still supported but application developers are encouraged to use UVCIOC_CTRL_QUERY instead.

For details on the UVCIOC_CTRL_QUERY ioctl please refer to the section titled “IOCTL reference” below.

Security

The API doesn’t currently provide a fine-grained access control facility. The UVCIOC_CTRL_ADD and UVCIOC_CTRL_MAP ioctls require super user permissions.

Suggestions on how to improve this are welcome.

Debugging

In order to debug problems related to XU controls or controls in general it is recommended to enable the UVC_TRACE_CONTROL bit in the module parameter ‘trace’. This causes extra output to be written into the system log.

IOCTL reference

UVCIOC_CTRL_MAP - Map a UVC control to a V4L2 control

Argument: struct uvc_xu_control_mapping

Description:

This ioctl creates a mapping between a UVC control or part of a UVC control and a V4L2 control. Once mappings are defined, userspace applications can access vendor-defined UVC control through the V4L2 control API.

To create a mapping, applications fill the uvc_xu_control_mapping structure with information about an existing UVC control defined with UVCIOC_CTRL_ADD and a new V4L2 control.

A UVC control can be mapped to several V4L2 controls. For instance, a UVC pan/tilt control could be mapped to separate pan and tilt V4L2 controls. The UVC control is divided into non overlapping fields using the ‘size’ and ‘offset’ fields and are then independently mapped to V4L2 control.

For signed integer V4L2 controls the data_type field should be set to UVC_CTRL_DATA_TYPE_SIGNED. Other values are currently ignored.

Return value:

On success 0 is returned. On error -1 is returned and errno is set appropriately.

ENOMEM Not enough memory to perform the operation.

EPERM Insufficient privileges (super user privileges are required).

EINVAL No such UVC control.

EOVERFLOW The requested offset and size would overflow the UVC control.

EEXIST Mapping already exists.

Data types:

```c
* struct uvc_xu_control_mapping
  __u32 id V4L2 control identifier
  __u8 name[32] V4L2 control name
  __u8 entity[16] UVC extension unit GUID
  __u8 selector UVC control selector
```
__u8  size       V4L2 control size (in bits)
__u8  offset     V4L2 control offset (in bits)
enum v4l2_ctrl_type
  v4l2_type       V4L2 control type
enum uvc_control_data_type
  data_type       UVC control data type
struct uvc_menu_info
  *menu_info      Array of menu entries (for menu controls only)
__u32  menu_count Number of menu entries (for menu controls only)
* struct uvc_menu_info

__u32  value      Menu entry value used by the device
__u8   name[32]   Menu entry name

* enum uvc_control_data_type
UVC_CTRL_DATA_TYPE_RAW          Raw control (byte array)
UVC_CTRL_DATA_TYPE_SIGNED       Signed integer
UVC_CTRL_DATA_TYPE_UNSIGNED     Unsigned integer
UVC_CTRL_DATA_TYPE_BOOLEAN      Boolean
UVC_CTRL_DATA_TYPE_ENUM         Enumeration
UVC_CTRL_DATA_TYPE_BITMASK      Bitmask

UVCIOC_CTRL_QUERY - Query a UVC XU control

Argument: struct uvc_xu_control_query

Description:

This ioctl queries a UVC XU control identified by its extension unit ID and control selector.

There are a number of different queries available that closely correspond to the low-level control
requests described in the UVC specification. These requests are:

- **UVC_GET_CUR**: Obtain the current value of the control.
- **UVC_GET_MIN**: Obtain the minimum value of the control.
- **UVC_GET_MAX**: Obtain the maximum value of the control.
- **UVC_GET_DEF**: Obtain the default value of the control.
- **UVC_GET_RES**: Query the resolution of the control, i.e. the step size of the allowed control
  values.
- **UVC_GET_LEN**: Query the size of the control in bytes.
- **UVC_GET_INFO**: Query the control information bitmap, which indicates whether get/set re-
  quests are supported.
- **UVC_SET_CUR**: Update the value of the control.

Applications must set the 'size' field to the correct length for the control. Exceptions are the
UVC_GET_LEN and UVC_GET_INFO queries, for which the size must be set to 2 and 1, respec-
respectively. The 'data' field must point to a valid writable buffer big enough to hold the indicated
number of data bytes.

Data is copied directly from the device without any driver-side processing. Applications are
responsible for data buffer formatting, including little-endian/big-endian conversion. This is
particularly important for the result of the UVC_GET_LEN requests, which is always returned
as a little-endian 16-bit integer by the device.

Return value:

4.28. The Linux USB Video Class (UVC) driver  991
On success 0 is returned. On error -1 is returned and errno is set appropriately.

**ENOENT** The device does not support the given control or the specified extension unit could not be found.

**ENOBUFFS** The specified buffer size is incorrect (too big or too small).

**EINVAL** An invalid request code was passed.

**EBADDRQC** The given request is not supported by the given control.

**EFAULT** The data pointer references an inaccessible memory area.

**Data types:**

```c
* struct uvc_xu_control_query
    __u8 unit Extension unit ID
    __u8 selector Control selector
    __u8 query Request code to send to the device
    __u16 size Control data size (in bytes)
    __u8 *data Control value
```

### 4.29 The Virtual Video Test Driver (vivid)

This driver emulates video4linux hardware of various types: video capture, video output, vbi capture and output, radio receivers and transmitters and a software defined radio receiver. In addition a simple framebuffer device is available for testing capture and output overlays.

Up to 64 vivid instances can be created, each with up to 16 inputs and 16 outputs.

Each input can be a webcam, TV capture device, S-Video capture device or an HDMI capture device. Each output can be an S-Video output device or an HDMI output device.

These inputs and outputs act exactly as a real hardware device would behave. This allows you to use this driver as a test input for application development, since you can test the various features without requiring special hardware.

This document describes the features implemented by this driver:

- Support for read()/write(), MMAP, USERPTR and DMABUF streaming I/O.
- A large list of test patterns and variations thereof
- Working brightness, contrast, saturation and hue controls
- Support for the alpha color component
- Full colorspace support, including limited/full RGB range
- All possible control types are present
- Support for various pixel aspect ratios and video aspect ratios
- Error injection to test what happens if errors occur
- Supports crop/compose/scale in any combination for both input and output
- Can emulate up to 4K resolutions
- All Field settings are supported for testing interlaced capturing
- Supports all standard YUV and RGB formats, including two multiplanar YUV formats
- Raw and Sliced VBI capture and output support
- Radio receiver and transmitter support, including RDS support
- Software defined radio (SDR) support
• Capture and output overlay support
These features will be described in more detail below.

4.29.1 Configuring the driver

By default the driver will create a single instance that has a video capture device with webcam, TV, S-
Video and HDMI inputs, a video output device with S-Video and HDMI outputs, one vbi capture device, one
vbi output device, one radio receiver device, one radio transmitter device and one SDR device.
The number of instances, devices, video inputs and outputs and their types are all configurable using the
following module options:

• n_devs:
  number of driver instances to create. By default set to 1. Up to 64 instances can be created.

• node_types:
  which devices should each driver instance create. An array of hexadecimal values, one for
each instance. The default is 0x1d3d. Each value is a bitmask with the following meaning:
  - bit 0: Video Capture node
  - bit 2-3: VBI Capture node: 0 = none, 1 = raw vbi, 2 = sliced vbi, 3 = both
  - bit 4: Radio Receiver node
  - bit 5: Software Defined Radio Receiver node
  - bit 8: Video Output node
  - bit 10-11: VBI Output node: 0 = none, 1 = raw vbi, 2 = sliced vbi, 3 = both
  - bit 12: Radio Transmitter node
  - bit 16: Framebuffer for testing overlays
So to create four instances, the first two with just one video capture device, the second two
with just one video output device you would pass these module options to vivid:

| n_devs=4 node_types=0x1,0x1,0x100,0x100 |

• num_inputs:
  the number of inputs, one for each instance. By default 4 inputs are created for each video
capture device. At most 16 inputs can be created, and there must be at least one.

• input_types:
  the input types for each instance, the default is 0xe4. This defines what the type of each
input is when the inputs are created for each driver instance. This is a hexadecimal value
with up to 16 pairs of bits, each pair gives the type and bits 0-1 map to input 0, bits 2-3 map
to input 1, 30-31 map to input 15. Each pair of bits has the following meaning:
  - 00: this is a webcam input
  - 01: this is a TV tuner input
  - 10: this is an S-Video input
  - 11: this is an HDMI input
So to create a video capture device with 8 inputs where input 0 is a TV tuner, inputs 1-3 are
S-Video inputs and inputs 4-7 are HDMI inputs you would use the following module options:

| num_inputs=8 input_types=0xffa9 |

• num_outputs:
the number of outputs, one for each instance. By default 2 outputs are created for each
video output device. At most 16 outputs can be created, and there must be at least one.

• output_types:
the output types for each instance, the default is 0x02. This defines what the type of each
output is when the outputs are created for each driver instance. This is a hexadecimal value
with up to 16 bits, each bit gives the type and bit 0 maps to output 0, bit 1 maps to output
1, bit 15 maps to output 15. The meaning of each bit is as follows:
- 0: this is an S-Video output
- 1: this is an HDMI output

So to create a video output device with 8 outputs where outputs 0-3 are S-Video outputs
and outputs 4-7 are HDMI outputs you would use the following module options:

```
num_outputs=8 output_types=0xf0
```

• vid_cap_nr:
give the desired videoX start number for each video capture device. The default is -1 which
will just take the first free number. This allows you to map capture video nodes to specific
videoX device nodes. Example:

```
n_devs=4 vid_cap_nr=2,4,6,8
```

This will attempt to assign /dev/video2 for the video capture device of the first vivid instance,
video4 for the next up to video8 for the last instance. If it can't succeed, then it will just
take the next free number.

• vid_out_nr:
give the desired videoX start number for each video output device. The default is -1 which
will just take the first free number.

• vbi_cap_nr:
give the desired vbiX start number for each vbi capture device. The default is -1 which will
just take the first free number.

• vbi_out_nr:
give the desired vbiX start number for each vbi output device. The default is -1 which will
just take the first free number.

• radio_rx_nr:
give the desired radioX start number for each radio receiver device. The default is -1 which
will just take the first free number.

• radio_tx_nr:
give the desired radioX start number for each radio transmitter device. The default is -1
which will just take the first free number.

• sdr_cap_nr:
give the desired swradioX start number for each SDR capture device. The default is -1 which
will just take the first free number.

• ccs_cap_mode:
specify the allowed video capture crop/compose/scaling combination for each driver in-
stance. Video capture devices can have any combination of cropping, composing and scaling
capabilities and this will tell the vivid driver which of those is should emulate. By default
the user can select this through controls.
The value is either -1 (controlled by the user) or a set of three bits, each enabling (1) or disabling (0) one of the features:

- bit 0:
  Enable crop support. Cropping will take only part of the incoming picture.
- bit 1:
  Enable compose support. Composing will copy the incoming picture into a larger buffer.
- bit 2:
  Enable scaling support. Scaling can scale the incoming picture. The scaler of the vivid driver can enlarge up or down to four times the original size. The scaler is very simple and low-quality. Simplicity and speed were key, not quality.

Note that this value is ignored by webcam inputs: those enumerate discrete framesizes and that is incompatible with cropping, composing or scaling.

- ccs_out_mode:
  specify the allowed video output crop/compose/scaling combination for each driver instance. Video output devices can have any combination of cropping, composing and scaling capabilities and this will tell the vivid driver which of those is should emulate. By default the user can select this through controls.

The value is either -1 (controlled by the user) or a set of three bits, each enabling (1) or disabling (0) one of the features:

- bit 0:
  Enable crop support. Cropping will take only part of the outgoing buffer.
- bit 1:
  Enable compose support. Composing will copy the incoming buffer into a larger picture frame.
- bit 2:
  Enable scaling support. Scaling can scale the incoming buffer. The scaler of the vivid driver can enlarge up or down to four times the original size. The scaler is very simple and low-quality. Simplicity and speed were key, not quality.

- multiplanar:
  select whether each device instance supports multi-planar formats, and thus the V4L2 multi-planar API. By default device instances are single-planar.

This module option can override that for each instance. Values are:

- 1: this is a single-planar instance.
- 2: this is a multi-planar instance.

- vivid_debug:
  enable driver debugging info

- no_error_inj:
  if set disable the error injecting controls. This option is needed in order to run a tool like v4l2-compliance. Tools like that exercise all controls including a control like ‘ Disconnect’ which emulates a USB disconnect, making the device inaccessible and so all tests that v4l2-compliance is doing will fail afterwards.

There may be other situations as well where you want to disable the error injection support of vivid. When this option is set, then the controls that select crop, compose and scale
behavior are also removed. Unless overridden by ccs_cap_mode and/or ccs_out_mode the
will default to enabling crop, compose and scaling.

Taken together, all these module options allow you to precisely customize the driver behavior and test
your application with all sorts of permutations. It is also very suitable to emulate hardware that is not yet
available, e.g. when developing software for a new upcoming device.

### 4.29.2 Video Capture

This is probably the most frequently used feature. The video capture device can be configured by using the
module options num_inputs, input_types and ccs_cap_mode (see section 1 for more detailed information),
but by default four inputs are configured: a webcam, a TV tuner, an S-Video and an HDMI input, one input
for each input type. Those are described in more detail below.

Special attention has been given to the rate at which new frames become available. The jitter will be
around 1 jiffie (that depends on the HZ configuration of your kernel, so usually 1/100, 1/250 or 1/1000 of a
second), but the long-term behavior is exactly following the framerate. So a framerate of 59.94 Hz is really
different from 60 Hz. If the framerate exceeds your kernel’s HZ value, then you will get dropped frames,
but the frame/field sequence counting will keep track of that so the sequence count will skip whenever
frames are dropped.

#### Webcam Input

The webcam input supports three framesizes: 320x180, 640x360 and 1280x720. It supports frames
per second settings of 10, 15, 25, 30, 50 and 60 fps. Which ones are available depends on the chosen
framesize: the larger the framesize, the lower the maximum frames per second.

The initially selected colorspace when you switch to the webcam input will be sRGB.

#### TV and S-Video Inputs

The only difference between the TV and S-Video input is that the TV has a tuner. Otherwise they behave
identically.

These inputs support audio inputs as well: one TV and one Line-In. They both support all TV standards.
If the standard is queried, then the Vivid controls ‘Standard Signal Mode’ and ‘Standard’ determine what
the result will be.

These inputs support all combinations of the field setting. Special care has been taken to faithfully repro-
duce how fields are handled for the different TV standards. This is particularly noticeable when generating
a horizontally moving image so the temporal effect of using interlaced formats becomes clearly visible.
For 50 Hz standards the top field is the oldest and the bottom field is the newest in time. For 60 Hz
standards that is reversed: the bottom field is the oldest and the top field is the newest in time.

When you start capturing in V4L2_FIELD_ALTERNATE mode the first buffer will contain the top field for 50
Hz standards and the bottom field for 60 Hz standards. This is what capture hardware does as well.

Finally, for PAL/SECAM standards the first half of the top line contains noise. This simulates the Wide
Screen Signal that is commonly placed there.

The initially selected colorspace when you switch to the TV or S-Video input will be SMPTE-170M.

The pixel aspect ratio will depend on the TV standard. The video aspect ratio can be selected through
the ‘Standard Aspect Ratio’ Vivid control. Choices are ‘4x3’, ‘16x9’ which will give letterboxed widescreen
video and ‘16x9 Anamorphic’ which will give full screen squashed anamorphic widescreen video that will
need to be scaled accordingly.

The TV ‘tuner’ supports a frequency range of 44-958 MHz. Channels are available every 6 MHz, starting
from 49.25 MHz. For each channel the generated image will be in color for the +/- 0.25 MHz around it,
and in grayscale for +/- 1 MHz around the channel. Beyond that it is just noise. The VIDIOC_G_TUNER
ioctl will return 100% signal strength for +/- 0.25 MHz and 50% for +/- 1 MHz. It will also return correct afc values to show whether the frequency is too low or too high.

The audio subchannels that are returned are MONO for the +/- 1 MHz range around a valid channel frequency. When the frequency is within +/- 0.25 MHz of the channel it will return either MONO, STEREO, either MONO | SAP (for NTSC) or LANG1 | LANG2 (for others), or STEREO | SAP.

Which one is returned depends on the chosen channel, each next valid channel will cycle through the possible audio subchannel combinations. This allows you to test the various combinations by just switching channels.

Finally, for these inputs the v4l2_timecode struct is filled in in the dequeued v4l2_buffer struct.

**HDMI Input**

The HDMI inputs supports all CEA-861 and DMT timings, both progressive and interlaced, for pixelclock frequencies between 25 and 600 MHz. The field mode for interlaced formats is always V4L2_FIELD_ALTERNATE. For HDMI the field order is always top field first, and when you start capturing an interlaced format you will receive the top field first.

The initially selected colorspace when you switch to the HDMI input or select an HDMI timing is based on the format resolution: for resolutions less than or equal to 720x576 the colorspace is set to SMPTE-170M, for others it is set to REC-709 (CEA-861 timings) or sRGB (VESA DMT timings).

The pixel aspect ratio will depend on the HDMI timing: for 720x480 is it set as for the NTSC TV standard, for 720x576 it is set as for the PAL TV standard, and for all others a 1:1 pixel aspect ratio is returned.

The video aspect ratio can be selected through the ‘DV Timings Aspect Ratio’ Vivid control. Choices are ‘Source Width x Height’ (just use the same ratio as the chosen format), ‘4x3’ or ‘16x9’, either of which can result in pillarboxed or letterboxed video.

For HDMI inputs it is possible to set the EDID. By default a simple EDID is provided. You can only set the EDID for HDMI inputs. Internally, however, the EDID is shared between all HDMI inputs.

No interpretation is done of the EDID data with the exception of the physical address. See the CEC section for more details.

There is a maximum of 15 HDMI inputs (if there are more, then they will be reduced to 15) since that’s the limitation of the EDID physical address.

**4.29.3 Video Output**

The video output device can be configured by using the module options num_outputs, output_types and ccs_out_mode (see section 1 for more detailed information), but by default two outputs are configured: an S-Video and an HDMI input, one output for each output type. Those are described in more detail below.

Like with video capture the framerate is also exact in the long term.

**S-Video Output**

This output supports audio outputs as well: “Line-Out 1” and “Line-Out 2”. The S-Video output supports all TV standards.

This output supports all combinations of the field setting.

The initially selected colorspace when you switch to the TV or S-Video input will be SMPTE-170M.
HDMI Output

The HDMI output supports all CEA-861 and DMT timings, both progressive and interlaced, for pix-
elclock frequencies between 25 and 600 MHz. The field mode for interlaced formats is always
V4L2_FIELD_ALTERNATE.

The initially selected colorspace when you switch to the HDMI output or select an HDMI timing is based on
the format resolution: for resolutions less than or equal to 720x576 the colorspace is set to SMPTE-170M,
for others it is set to REC-709 (CEA-861 timings) or sRGB (VESA DMT timings).

The pixel aspect ratio will depend on the HDMI timing: for 720x480 is it set as for the NTSC TV standard,
for 720x576 it is set as for the PAL TV standard, and for all others a 1:1 pixel aspect ratio is returned.

An HDMI output has a valid EDID which can be obtained through VIDIOC_G_EDID.

There is a maximum of 15 HDMI outputs (if there are more, then they will be reduced to 15) since that’s
the limitation of the EDID physical address. See also the CEC section for more details.

4.29.4 VBI Capture

There are three types of VBI capture devices: those that only support raw (undecoded) VBI, those that
only support sliced (decoded) VBI and those that support both. This is determined by the node_types
module option. In all cases the driver will generate valid VBI data: for 60 Hz standards it will generate
Closed Caption and XDS data. The closed caption stream will alternate between “Hello world!” and
“Closed captions test” every second. The XDS stream will give the current time once a minute. For 50 Hz
standards it will generate the Wide Screen Signal which is based on the actual Video Aspect Ratio control
setting and teletext pages 100-159, one page per frame.

The VBI device will only work for the S-Video and TV inputs, it will give back an error if the current input
is a webcam or HDMI.

4.29.5 VBI Output

There are three types of VBI output devices: those that only support raw (undecoded) VBI, those that only
support sliced (decoded) VBI and those that support both. This is determined by the node_types module
option.

The sliced VBI output supports the Wide Screen Signal and the teletext signal for 50 Hz standards and
Closed Captioning + XDS for 60 Hz standards.

The VBI device will only work for the S-Video output, it will give back an error if the current output is HDMI.

4.29.6 Radio Receiver

The radio receiver emulates an FM/AM/SW receiver. The FM band also supports RDS. The frequency ranges
are:

- FM: 64 MHz - 108 MHz
- AM: 520 kHz - 1710 kHz
- SW: 2300 kHz - 26.1 MHz

Valid channels are emulated every 1 MHz for FM and every 100 kHz for AM and SW. The signal strength
decreases the further the frequency is from the valid frequency until it becomes 0% at +/- 50 kHz (FM) or
5 kHz (AM/SW) from the ideal frequency. The initial frequency when the driver is loaded is set to 95 MHz.

The FM receiver supports RDS as well, both using ‘Block I/O’ and ‘Controls’ modes. In the ‘Controls’ mode
the RDS information is stored in read-only controls. These controls are updated every time the frequency
is changed, or when the tuner status is requested. The Block I/O method uses the read() interface to pass
the RDS blocks on to the application for decoding.
The RDS signal is ‘detected’ for +/- 12.5 kHz around the channel frequency, and the further the frequency
is away from the valid frequency the more RDS errors are randomly introduced into the block I/O stream, 
up to 50% of all blocks if you are +/- 12.5 kHz from the channel frequency. All four errors can occur in 
equal proportions: blocks marked ‘CORRECTED’, blocks marked ‘ERROR’, blocks marked ‘INVALID’ and 
dropped blocks.

The generated RDS stream contains all the standard fields contained in a 0B group, and also radio text 
and the current time.

The receiver supports HW frequency seek, either in Bounded mode, Wrap Around mode or both, which is 
configurable with the “Radio HW Seek Mode” control.

4.29.7 Radio Transmitter

The radio transmitter emulates an FM/AM/SW transmitter. The FM band also supports RDS. The frequency 
ranges are:

- FM: 64 MHz - 108 MHz
- AM: 520 kHz - 1710 kHz
- SW: 2300 kHz - 26.1 MHz

The initial frequency when the driver is loaded is 95.5 MHz.

The FM transmitter supports RDS as well, both using ‘Block I/O’ and ‘Controls’ modes. In the ‘Controls’ 
mode the transmitted RDS information is configured using controls, and in ‘Block I/O’ mode the blocks are 
passed to the driver using write().

4.29.8 Software Defined Radio Receiver

The SDR receiver has three frequency bands for the ADC tuner:

- 300 kHz
- 900 kHz - 2800 kHz
- 3200 kHz

The RF tuner supports 50 MHz - 2000 MHz.

The generated data contains the In-phase and Quadrature components of a 1 kHz tone that has an am-
plitude of sqrt(2).

4.29.9 Controls

Different devices support different controls. The sections below will describe each control and which 
devices support them.

User Controls - Test Controls

The Button, Boolean, Integer 32 Bits, Integer 64 Bits, Menu, String, Bitmask and Integer Menu are controls 
that represent all possible control types. The Menu control and the Integer Menu control both have ‘holes’ 
in their menu list, meaning that one or more menu items return EINVAL when VIDIOC_QUERYMENU is 
called. Both menu controls also have a non-zero minimum control value. These features allow you to 
check if your application can handle such things correctly. These controls are supported for every device 
type.
User Controls - Video Capture

The following controls are specific to video capture.

The Brightness, Contrast, Saturation and Hue controls actually work and are standard. There is one special feature with the Brightness control: each video input has its own brightness value, so changing input will restore the brightness for that input. In addition, each video input uses a different brightness range (minimum and maximum control values). Switching inputs will cause a control event to be sent with the V4L2_EVENT_CTRL_CH_RANGE flag set. This allows you to test controls that can change their range.

The ‘Gain, Automatic’ and Gain controls can be used to test volatile controls: if ‘Gain, Automatic’ is set, then the Gain control is volatile and changes constantly. If ‘Gain, Automatic’ is cleared, then the Gain control is a normal control.

The ‘Horizontal Flip’ and ‘Vertical Flip’ controls can be used to flip the image. These combine with the ‘Sensor Flipped Horizontally/Vertically’ Vivid controls.

The ‘Alpha Component’ control can be used to set the alpha component for formats containing an alpha channel.

User Controls - Audio

The following controls are specific to video capture and output and radio receivers and transmitters.
The ‘Volume’ and ‘Mute’ audio controls are typical for such devices to control the volume and mute the audio. They don’t actually do anything in the vivid driver.

Vivid Controls

These vivid custom controls control the image generation, error injection, etc.

Test Pattern Controls

The Test Pattern Controls are all specific to video capture.

- Test Pattern:
  selects which test pattern to use. Use the CSC Colorbar for testing colorspace conversions: the colors used in that test pattern map to valid colors in all colorspaces. The colorspace conversion is disabled for the other test patterns.

- OSD Text Mode:
  selects whether the text superimposed on the test pattern should be shown, and if so, whether only counters should be displayed or the full text.

- Horizontal Movement:
  selects whether the test pattern should move to the left or right and at what speed.

- Vertical Movement:
  does the same for the vertical direction.

- Show Border:
  show a two-pixel wide border at the edge of the actual image, excluding letter or pillarboxing.

- Show Square:
  show a square in the middle of the image. If the image is displayed with the correct pixel and image aspect ratio corrections, then the width and height of the square on the monitor should be the same.

- Insert SAV Code in Image:
adds a SAV (Start of Active Video) code to the image. This can be used to check if such
codes in the image are inadvertently interpreted instead of being ignored.

- Insert EAV Code in Image:
  
  does the same for the EAV (End of Active Video) code.

**Capture Feature Selection Controls**

These controls are all specific to video capture.

- **Sensor Flipped Horizontally:**
  
  the image is flipped horizontally and the V4L2_IN_ST_HFLIP input status flag is set. This
  emulates the case where a sensor is for example mounted upside down.

- **Sensor Flipped Vertically:**
  
  the image is flipped vertically and the V4L2_IN_ST_VFLIP input status flag is set. This emu-
  lates the case where a sensor is for example mounted upside down.

- **Standard Aspect Ratio:**
  
  selects if the image aspect ratio as used for the TV or S-Video input should be 4x3, 16x9 or
  anamorphic widescreen. This may introduce letterboxing.

- **DV Timings Aspect Ratio:**
  
  selects if the image aspect ratio as used for the HDMI input should be the same as the
  source width and height ratio, or if it should be 4x3 or 16x9. This may introduce letter or
  pillarboxing.

- **Timestamp Source:**
  
  selects when the timestamp for each buffer is taken.

- **Colorspace:**
  
  selects which colorspace should be used when generating the image. This only applies if the
  CSC Colorbar test pattern is selected, otherwise the test pattern will go through unconverted.
  This behavior is also what you want, since a 75% Colorbar should really have 75% signal
  intensity and should not be affected by colorspace conversions.

  Changing the colorspace will result in the V4L2_EVENT_SOURCE_CHANGE to be sent since
  it emulates a detected colorspace change.

- **Transfer Function:**
  
  selects which colorspace transfer function should be used when generating an image. This only
  applies if the CSC Colorbar test pattern is selected, otherwise the test pattern will go
  through unconverted. This behavior is also what you want, since a 75% Colorbar should
  really have 75% signal intensity and should not be affected by colorspace conversions.

  Changing the transfer function will result in the V4L2_EVENT_SOURCE_CHANGE to be sent
  since it emulates a detected colorspace change.

- **Y’CbCr Encoding:**
  
  selects which Y’CbCr encoding should be used when generating a Y’CbCr image. This only
  applies if the format is set to a Y’CbCr format as opposed to an RGB format.

  Changing the Y’CbCr encoding will result in the V4L2_EVENT_SOURCE_CHANGE to be sent
  since it emulates a detected colorspace change.

- **Quantization:**
  
  selects which quantization should be used for the RGB or Y’CbCr encoding when generating
  the test pattern.
Changing the quantization will result in the V4L2_EVENT_SOURCE_CHANGE to be sent since it emulates a detected colorspace change.

- **Limited RGB Range (16-235):**
  selects if the RGB range of the HDMI source should be limited or full range. This combines with the Digital Video ‘Rx RGB Quantization Range’ control and can be used to test what happens if a source provides you with the wrong quantization range information. See the description of that control for more details.

- **Apply Alpha To Red Only:**
  apply the alpha channel as set by the ‘Alpha Component’ user control to the red color of the test pattern only.

- **Enable Capture Cropping:**
  enables crop support. This control is only present if the ccs_cap_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Enable Capture Composing:**
  enables composing support. This control is only present if the ccs_cap_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Enable Capture Scaler:**
  enables support for a scaler (maximum 4 times upscaling and downscaling). This control is only present if the ccs_cap_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Maximum EDID Blocks:**
  determines how many EDID blocks the driver supports. Note that the vivid driver does not actually interpret new EDID data, it just stores it. It allows for up to 256 EDID blocks which is the maximum supported by the standard.

- **Fill Percentage of Frame:**
  can be used to draw only the top X percent of the image. Since each frame has to be drawn by the driver, this demands a lot of the CPU. For large resolutions this becomes problematic. By drawing only part of the image this CPU load can be reduced.

**Output Feature Selection Controls**

These controls are all specific to video output.

- **Enable Output Cropping:**
  enables crop support. This control is only present if the ccs_out_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Enable Output Composing:**
  enables composing support. This control is only present if the ccs_out_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).

- **Enable Output Scaler:**
  enables support for a scaler (maximum 4 times upscaling and downscaling). This control is only present if the ccs_out_mode module option is set to the default value of -1 and if the no_error_inj module option is set to 0 (the default).
Error Injection Controls

The following two controls are only valid for video and vbi capture.

- **Standard Signal Mode:**
  selects the behavior of VIDIOC_QUERYSTD: what should it return?
  Changing this control will result in the V4L2 EVENT_SOURCE_CHANGE to be sent since it emulates a changed input condition (e.g. a cable was plugged in or out).

- **Standard:**
  selects the standard that VIDIOC_QUERYSTD should return if the previous control is set to “Selected Standard”.
  Changing this control will result in the V4L2 EVENT_SOURCE_CHANGE to be sent since it emulates a changed input standard.

The following two controls are only valid for video capture.

- **DV Timings Signal Mode:** selects the behavior of VIDIOC_QUERY_DV_TIMINGS: what should it return?
  Changing this control will result in the V4L2 EVENT_SOURCE_CHANGE to be sent since it emulates a changed input condition (e.g. a cable was plugged in or out).

- **DV Timings:**
  selects the timings the VIDIOC_QUERY_DV_TIMINGS should return if the previous control is set to “Selected DV Timings”.
  Changing this control will result in the V4L2 EVENT_SOURCE_CHANGE to be sent since it emulates changed input timings.

The following controls are only present if the no_error_inj module option is set to 0 (the default). These controls are valid for video and vbi capture and output streams and for the SDR capture device except for the Disconnect control which is valid for all devices.

- **Wrap Sequence Number:**
  test what happens when you wrap the sequence number in struct v4l2_buffer around.

- **Wrap Timestamp:**
  test what happens when you wrap the timestamp in struct v4l2_buffer around.

- **Percentage of Dropped Buffers:**
  sets the percentage of buffers that are never returned by the driver (i.e., they are dropped).

- **Disconnect:**
  emulates a USB disconnect. The device will act as if it has been disconnected. Only after all open filehandles to the device node have been closed will the device become ‘connected’ again.

- **Inject V4L2_BUF_FLAG_ERROR:**
  when pressed, the next frame returned by the driver will have the error flag set (i.e. the frame is marked corrupt).

- **Inject VIDIOC_REQBUFS Error:**
  when pressed, the next REQBUFS or CREATE_BUFS ioctl call will fail with an error. To be precise: the videobuf2 queue_setup() op will return -EINVAL.

- **Inject VIDIOC_QBUF Error:**
  when pressed, the next VIDIOC_QBUF or VIDIOC_PREPARE_BUFFER ioctl call will fail with an error. To be precise: the videobuf2 buf_prepare() op will return -EINVAL.
• Inject VIDIOC_STREAMON Error:
  when pressed, the next VIDIOC_STREAMON ioctl call will fail with an error. To be precise:
  the videobuf2 start_streaming() op will return -EINVAL.

• Inject Fatal Streaming Error:
  when pressed, the streaming core will be marked as having suffered a fatal error, the
  only way to recover from that is to stop streaming. To be precise: the videobuf2
  vb2_queue_error() function is called.

VBI Raw Capture Controls

• Interlaced VBI Format:
  if set, then the raw VBI data will be interlaced instead of providing it grouped by field.

Digital Video Controls

• Rx RGB Quantization Range:
  sets the RGB quantization detection of the HDMI input. This combines with the Vivid ‘Limited
  RGB Range (16-235)’ control and can be used to test what happens if a source provides you
  with the wrong quantization range information. This can be tested by selecting an HDMI
  input, setting this control to Full or Limited range and selecting the opposite in the ‘Limited
  RGB Range (16-235)’ control. The effect is easy to see if the ‘Gray Ramp’ test pattern is
  selected.

• Tx RGB Quantization Range:
  sets the RGB quantization detection of the HDMI output. It is currently not used for anything
  in vivid, but most HDMI transmitters would typically have this control.

• Transmit Mode:
  sets the transmit mode of the HDMI output to HDMI or DVI-D. This affects the reported
  colorspace since DVI_D outputs will always use sRGB.

FM Radio Receiver Controls

• RDS Reception:
  set if the RDS receiver should be enabled.

• RDS Program Type:
• RDS PS Name:
• RDS Radio Text:
• RDS Traffic Announcement:
• RDS Traffic Program:
• RDS Music:
  these are all read-only controls. If RDS Rx I/O Mode is set to “Block I/O”, then they are
  inactive as well. If RDS Rx I/O Mode is set to “Controls”, then these controls report the
  received RDS data.
**Note:**

The vivid implementation of this is pretty basic: they are only updated when you set a new frequency or when you get the tuner status (VIDIOC_G_TUNER).

- **Radio HW Seek Mode:**
  can be one of “Bounded”, “Wrap Around” or “Both”. This determines if VIDIOC_S_HW_FREQSEEK will be bounded by the frequency range or wrap-around or if it is selectable by the user.

- **Radio Programmable HW Seek:**
  if set, then the user can provide the lower and upper bound of the HW Seek. Otherwise the frequency range boundaries will be used.

- **Generate RBDS Instead of RDS:**
  if set, then generate RBDS (the US variant of RDS) data instead of RDS (European-style RDS). This affects only the PICODE and PTY codes.

- **RDS Rx I/O Mode:**
  this can be “Block I/O” where the RDS blocks have to be read() by the application, or “Controls” where the RDS data is provided by the RDS controls mentioned above.

**FM Radio Modulator Controls**

- **RDS Program ID:**
- **RDS Program Type:**
- **RDS PS Name:**
- **RDS Radio Text:**
- **RDS Stereo:**
- **RDS Artificial Head:**
- **RDS Compressed:**
- **RDS Dynamic PTY:**
- **RDS Traffic Announcement:**
- **RDS Traffic Program:**
- **RDS Music:**
  these are all controls that set the RDS data that is transmitted by the FM modulator.

- **RDS Tx I/O Mode:**
  this can be “Block I/O” where the application has to use write() to pass the RDS blocks to the driver, or “Controls” where the RDS data is provided by the RDS controls mentioned above.

**4.29.10 Video, VBI and RDS Looping**

The vivid driver supports looping of video output to video input, VBI output to VBI input and RDS output to RDS input. For video/VBI looping this emulates as if a cable was hooked up between the output and input connector. So video and VBI looping is only supported between S-Video and HDMI inputs and outputs. VBI is only valid for S-Video as it makes no sense for HDMI.

Since radio is wireless this looping always happens if the radio receiver frequency is close to the radio transmitter frequency. In that case the radio transmitter will ‘override’ the emulated radio stations.
Looping is currently supported only between devices created by the same vivid driver instance.

**Video and Sliced VBI looping**

The way to enable video/VBI looping is currently fairly crude. A ‘Loop Video’ control is available in the “Vivid” control class of the video capture and VBI capture devices. When checked the video looping will be enabled. Once enabled any video S-Video or HDMI input will show a static test pattern until the video output has started. At that time the video output will be looped to the video input provided that:

- the input type matches the output type. So the HDMI input cannot receive video from the S-Video output.
- the video resolution of the video input must match that of the video output. So it is not possible to loop a 50 Hz (720x576) S-Video output to a 60 Hz (720x480) S-Video input, or a 720p60 HDMI output to a 1080p30 input.
- the pixel formats must be identical on both sides. Otherwise the driver would have to do pixel format conversion as well, and that’s taking things too far.
- the field settings must be identical on both sides. Same reason as above: requiring the driver to convert from one field format to another complicated matters too much. This also prohibits capturing with ‘Field Top’ or ‘Field Bottom’ when the output video is set to ‘Field Alternate’. This combination, while legal, became too complicated to support. Both sides have to be ‘Field Alternate’ for this to work. Also note that for this specific case the sequence and field counting in struct v4l2_buffer on the capture side may not be 100% accurate.
- field settings V4L2_FIELD_SEQ_TB/BT are not supported. While it is possible to implement this, it would mean a lot of work to get this right. Since these field values are rarely used the decision was made not to implement this for now.
- on the input side the “Standard Signal Mode” for the S-Video input or the “DV Timings Signal Mode” for the HDMI input should be configured so that a valid signal is passed to the video input.

The framerates do not have to match, although this might change in the future.

By default you will see the OSD text superimposed on top of the looped video. This can be turned off by changing the “OSD Text Mode” control of the video capture device.

For VBI looping to work all of the above must be valid and in addition the vbi output must be configured for sliced VBI. The VBI capture side can be configured for either raw or sliced VBI. Note that at the moment only CC/XDS (60 Hz formats) and WSS (50 Hz formats) VBI data is looped. Teletext VBI data is not looped.

**Radio & RDS Looping**

As mentioned in section 6 the radio receiver emulates stations are regular frequency intervals. Depending on the frequency of the radio receiver a signal strength value is calculated (this is returned by VID-IOC_G_TUNER). However, it will also look at the frequency set by the radio transmitter and if that results in a higher signal strength than the settings of the radio transmitter will be used as if it was a valid station. This also includes the RDS data (if any) that the transmitter ‘transmits’. This is received faithfully on the receiver side. Note that when the driver is loaded the frequencies of the radio receiver and transmitter are not identical, so initially no looping takes place.

**4.29.11 Cropping, Composing, Scaling**

This driver supports cropping, composing and scaling in any combination. Normally which features are supported can be selected through the Vivid controls, but it is also possible to hardcode it when the module is loaded through the ccs_cap_mode and ccs_out_mode module options. See section 1 on the details of these module options.

This allows you to test your application for all these variations.
Note that the webcam input never supports cropping, composing or scaling. That only applies to the TV/S-Video/HDMI inputs and outputs. The reason is that webcams, including this virtual implementation, normally use VIDIOC_ENUM_FRAMESIZES to list a set of discrete framesizes that it supports. And that does not combine with cropping, composing or scaling. This is primarily a limitation of the V4L2 API which is carefully reproduced here.

The minimum and maximum resolutions that the scaler can achieve are 16x16 and (4096 * 4) x (2160 x 4), but it can only scale up or down by a factor of 4 or less. So for a source resolution of 1280x720 the minimum the scaler can do is 320x180 and the maximum is 5120x2880. You can play around with this using the qv4l2 test tool and you will see these dependencies.

This driver also supports larger ‘bytesperline’ settings, something that VIDIOC_S_FMT allows but that few drivers implement.

The scaler is a simple scaler that uses the Coarse Bresenham algorithm. It’s designed for speed and simplicity, not quality.

If the combination of crop, compose and scaling allows it, then it is possible to change crop and compose rectangles on the fly.

### 4.29.12 Formats

The driver supports all the regular packed and planar 4:4:4, 4:2:2 and 4:2:0 YUYV formats, 8, 16, 24 and 32 RGB packed formats and various multiplanar formats.

The alpha component can be set through the ‘Alpha Component’ User control for those formats that support it. If the ‘Apply Alpha To Red Only’ control is set, then the alpha component is only used for the color red and set to 0 otherwise.

The driver has to be configured to support the multiplanar formats. By default the driver instances are single-planar. This can be changed by setting the multiplanar module option, see section 1 for more details on that option.

If the driver instance is using the multiplanar formats/API, then the first single planar format (YUYV) and the multiplanar NV16M and NV61M formats the will have a plane that has a non-zero data_offset of 128 bytes. It is rare for data_offset to be non-zero, so this is a useful feature for testing applications.

Video output will also honor any data_offset that the application set.

### 4.29.13 Capture Overlay

Note: capture overlay support is implemented primarily to test the existing V4L2 capture overlay API. In practice few if any GPUs support such overlays anymore, and neither are they generally needed anymore since modern hardware is so much more capable. By setting flag 0x10000 in the node_types module option the vivid driver will create a simple framebuffer device that can be used for testing this API. Whether this API should be used for new drivers is questionable.

This driver has support for a destructive capture overlay with bitmap clipping and list clipping (up to 16 rectangles) capabilities. Overlays are not supported for multiplanar formats. It also honors the struct v4l2_window field setting: if it is set to FIELD_TOP or FIELD_BOTTOM and the capture setting is FIELD_ALTERNATE, then only the top or bottom fields will be copied to the overlay.

The overlay only works if you are also capturing at that same time. This is a vivid limitation since it copies from a buffer to the overlay instead of filling the overlay directly. And if you are not capturing, then no buffers are available to fill.

In addition, the pixelformat of the capture format and that of the framebuffer must be the same for the overlay to work. Otherwise VIDIOC_OVERLAY will return an error.

In order to really see what it going on you will need to create two vivid instances: the first with a framebuffer enabled. You configure the capture overlay of the second instance to use the framebuffer of the first, then you start capturing in the second instance. For the first instance you setup the output overlay...
for the video output, turn on video looping and capture to see the blended framebuffer overlay that's
being written to by the second instance. This setup would require the following commands:

```bash
$ sudo modprobe vivid n_devs=2 node_types=0x10101,0x1
$ v4l2-ctl -d 1 --find-fb
/dev/fb1 is the framebuffer associated with base address 0x12800000
$ sudo v4l2-ctl -d 2 --set-fbuf fb=1
$ v4l2-ctl -d 1 --set-fbuf fb=1
$ v4l2-ctl -d 0 --set-fmt-video=fiformat='AR15'
$ v4l2-ctl -d 1 --set-fmt-video-out=pixelformat='AR15'
$ v4l2-ctl -d 2 --set-fmt-video=pixelformat='AR15'
$ v4l2-ctl -d 0 -i 2
$ v4l2-ctl -d 2 -i 2
$ v4l2-ctl -d 2 -c horizontal_movement=4
$ v4l2-ctl -d 1 --overlay=1
$ v4l2-ctl -d 1 -c loop_video=1
$ v4l2-ctl -d 2 --stream-mmap --overlay=1

And from another console:

$ v4l2-ctl -d 1 --stream-out-mmap

And yet another console:

$ qv4l2

and start streaming.

As you can see, this is not for the faint of heart...

### 4.29.14 Output Overlay

Note: output overlays are primarily implemented in order to test the existing V4L2 output overlay API. Whether this API should be used for new drivers is questionable.

This driver has support for an output overlay and is capable of:

- bitmap clipping,
- list clipping (up to 16 rectangles)
- chromakey
- source chromakey
- global alpha
- local alpha
- local inverse alpha

Output overlays are not supported for multiplanar formats. In addition, the pixelformat of the capture format and that of the framebuffer must be the same for the overlay to work. Otherwise VIDIOC_OVERLAY will return an error.

Output overlays only work if the driver has been configured to create a framebuffer by setting flag 0x10000 in the node_types module option. The created framebuffer has a size of 720x576 and supports ARGB 1:5:5:5 and RGB 5:6:5.

In order to see the effects of the various clipping, chromakeying or alpha processing capabilities you need to turn on video looping and see the results on the capture side. The use of the clipping, chromakeying or alpha processing capabilities will slow down the video loop considerably as a lot of checks have to be done per pixel.
4.29.15 CEC (Consumer Electronics Control)

If there are HDMI inputs then a CEC adapter will be created that has the same number of input ports. This is the equivalent of e.g. a TV that has that number of inputs. Each HDMI output will also create a CEC adapter that is hooked up to the corresponding input port, or (if there are more outputs than inputs) is not hooked up at all. In other words, this is the equivalent of hooking up each output device to an input port of the TV. Any remaining output devices remain unconnected.

The EDID that each output reads reports a unique CEC physical address that is based on the physical address of the EDID of the input. So if the EDID of the receiver has physical address A.B.0.0, then each output will see an EDID containing physical address A.B.C.0 where C is 1 to the number of inputs. If there are more outputs than inputs then the remaining outputs have a CEC adapter that is disabled and reports an invalid physical address.

4.29.16 Some Future Improvements

Just as a reminder and in no particular order:

- Add a virtual alsa driver to test audio
- Add virtual sub-devices and media controller support
- Some support for testing compressed video
- Add support to loop raw VBI output to raw VBI input
- Add support to loop teletext sliced VBI output to VBI input
- Fix sequence/field numbering when looping of video with alternate fields
- Add support for V4L2_CID_BG_COLOR for video outputs
- Add ARGB888 overlay support: better testing of the alpha channel
- Improve pixel aspect support in the tpg code by passing a real v4l2_fract
- Use per-queue locks and/or per-device locks to improve throughput
- Add support to loop from a specific output to a specific input across vivid instances
- The SDR radio should use the same ‘frequencies’ for stations as the normal radio receiver, and give back noise if the frequency doesn't match up with a station frequency
- Make a thread for the RDS generation, that would help in particular for the “Controls” RDS Rx I/O Mode as the read-only RDS controls could be updated in real-time.
- Changing the EDID should cause hotplug detect emulation to happen.

4.30 The Zoran driver

unified zoran driver (zr360x7, zoran, buz, dc10(+), dc30(+), lml33)

website: http://mjpeg.sourceforge.net/driver-zoran/

4.30.1 Frequently Asked Questions

4.30.2 What cards are supported

Iomega Buz, Linux Media Labs LML33/LML33R10, Pinnacle/Miro DC10/DC10+/DC30/DC30+ and related boards (available under various names).
Iomega Buz

- Zoran zr36067 PCI controller
- Zoran zr36060 MJPEG codec
- Philips saa7111 TV decoder
- Philips saa7185 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, saa7111, saa7185, zr36060, zr36067

Inputs/outputs: Composite and S-video

Norms: PAL, SECAM (720x576 @ 25 fps), NTSC (720x480 @ 29.97 fps)

Card number: 7

AverMedia 6 Eyes AVS6EYES

- Zoran zr36067 PCI controller
- Zoran zr36060 MJPEG codec
- Samsung ks0127 TV decoder
- Conexant bt866 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, ks0127, bt866, zr36060, zr36067

Inputs/outputs: Six physical inputs. 1-6 are composite, 1-2, 3-4, 5-6 doubles as S-video, 1-3 triples as component. One composite output.

Norms: PAL, SECAM (720x576 @ 25 fps), NTSC (720x480 @ 29.97 fps)

Card number: 8

Note:

*Not autodetected, card=8 is necessary.*

Linux Media Labs LML33

- Zoran zr36067 PCI controller
- Zoran zr36060 MJPEG codec
- Brooktree bt819 TV decoder
- Brooktree bt856 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, bt819, bt856, zr36060, zr36067

Inputs/outputs: Composite and S-video

Norms: PAL (720x576 @ 25 fps), NTSC (720x480 @ 29.97 fps)

Card number: 5

Linux Media Labs LML33R10

- Zoran zr36067 PCI controller
- Zoran zr36060 MJPEG codec
- Philips saa7114 TV decoder
• Analog Devices adv7170 TV encoder
Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, saa7114, adv7170, zr36060, zr36067
Inputs/outputs: Composite and S-video
Norms: PAL (720x576 @ 25 fps), NTSC (720x480 @ 29.97 fps)
Card number: 6

**Pinnacle/Miro DC10(new)**

• Zoran zr36057 PCI controller
• Zoran zr36060 MJPEG codec
• Philips saa7110a TV decoder
• Analog Devices adv7176 TV encoder
Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, saa7110, adv7175, zr36060, zr36067
Inputs/outputs: Composite, S-video and Internal
Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)
Card number: 1

**Pinnacle/Miro DC10+**

• Zoran zr36067 PCI controller
• Zoran zr36060 MJPEG codec
• Philips saa7110a TV decoder
• Analog Devices adv7176 TV encoder
Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, saa7110, adv7175, zr36060, zr36067
Inputs/outputs: Composite, S-video and Internal
Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)
Card number: 2

**Pinnacle/Miro DC10(old)**

• Zoran zr36057 PCI controller
• Zoran zr36050 MJPEG codec
• Zoran zr36016 Video Front End or Fuji md0211 Video Front End (clone?)
• Micronas vpx3220a TV decoder
• mse3000 TV encoder or Analog Devices adv7176 TV encoder
Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, vpx3220, mse3000/adv7175, zr36050, zr36016, zr36067
Inputs/outputs: Composite, S-video and Internal
Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)
Card number: 0

4.30. The Zoran driver
Pinnacle/Miro DC30

- Zoran zr36057 PCI controller
- Zoran zr36050 MJPEG codec
- Zoran zr36016 Video Front End
- Micronas vpx3225d/vpx3220a/vpx3216b TV decoder

Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)
Card number: 3

Pinnacle/Miro DC30+

- Zoran zr36067 PCI controller
- Zoran zr36050 MJPEG codec
- Zoran zr36016 Video Front End
- Micronas vpx3225d/vpx3220a/vpx3216b TV decoder
- Analog Devices adv7176 TV encoder

Drivers to use: videodev, i2c-core, i2c-algo-bit, videocodec, vpx3220/vpx3224, adv7175, zr36050, zr36015, zr36067

Inputs/outputs: Composite, S-video and Internal
Norms: PAL, SECAM (768x576 @ 25 fps), NTSC (640x480 @ 29.97 fps)
Card number: 4

Note:

1. No module for the mse3000 is available yet
2. No module for the vpx3224 is available yet

4.30.3 1.1 What the TV decoder can do and what not

The best known TV standards are NTSC/PAL/SECAM, but for decoding a frame that information is not enough. There are several formats of the TV standards. And not every TV decoder is able to handle every format. Also the every combination is supported by the driver. There are currently 11 different tv broadcast formats all over the world.

The CCIR defines parameters needed for broadcasting the signal. The CCIR has defined different standards: A,B,D,E,F,G,D,H,I,K,K1,L,M,N,... The CCIR says not much about the colorsystem used !!! And talking about a colorsystem says not too much about how it is broadcast.

The CCIR standards A,E,F are not used any more.

When you speak about NTSC, you usually mean the standard: CCIR - M using the NTSC colorsystem which is used in the USA, Japan, Mexico, Canada and a few others.

When you talk about PAL, you usually mean: CCIR - B/G using the PAL colorsystem which is used in many Countries.
When you talk about SECAM, you mean: CCIR - L using the SECAM Colorsystem which is used in France, and a few others.

There the other version of SECAM, CCIR - D/K is used in Bulgaria, China, Slovakai, Hungary, Korea (Rep.), Poland, Rumania and a others.

The CCIR - H uses the PAL colorsystem (sometimes SECAM) and is used in Egypt, Libya, Sri Lanka, Syrain Arab. Rep.

The CCIR - I uses the PAL colorsystem, and is used in Great Britain, Hong Kong, Ireland, Nigeria, South Africa.

The CCIR - N uses the PAL colorsystem and PAL frame size but the NTSC framerate, and is used in Argen-tinia, Uruguay, an a few others

We do not talk about how the audio is broadcast!

Other weird things around: NTSC 4.43 is a modificated NTSC, which is mainly used in PAL VCR’s that are able to play back NTSC. PAL 60 seems to be the same as NTSC 4.43 . The Datasheets also talk about NTSC 44, It seems as if it would be the same as NTSC 4.43. NTSC Combs seems to be a decoder mode where the decoder uses a comb filter to split coma and luma instead of a Delay line.

But I did not defiantly find out what NTSC Comb is.

**Philips saa7111 TV decoder**

- was introduced in 1997, is used in the BUZ and
- can handle: PAL B/G/H/I, PAL N, PAL M, NTSC M, NTSC N, NTSC 4.43 and SECAM

**Philips saa7110a TV decoder**

- was introduced in 1995, is used in the Pinnacle/Miro DC10(new), DC10+ and
- can handle: PAL B/G, NTSC M and SECAM

**Philips saa7114 TV decoder**

- was introduced in 2000, is used in the LML33R10 and
- can handle: PAL B/G/D/H/I/N, PAL N, PAL M, NTSC M, NTSC 4.43 and SECAM

**Brooktree bt819 TV decoder**

- was introduced in 1996, and is used in the LML33 and
- can handle: PAL B/D/G/H/I, NTSC M

**Micronas vpx3220a TV decoder**

- was introduced in 1996, is used in the DC30 and DC30+ and
- can handle: PAL B/G/H/I, PAL N, PAL M, NTSC M, NTSC 44, PAL 60, SECAM,NTSC Comb
Samsung ks0127 TV decoder

- is used in the AVS6EYES card and
- can handle: NTSC-M/N/44, PAL-M/N/B/G/H/I/D/K/L and SECAM

4.30.4 What the TV encoder can do and what not

The TV encoder are doing the “same” as the decoder, but in the order direction. You feed them digital data and generate a Composite or SVHS signal. For information about the colorsystems and TV norm take a look in the TV decoder section.

Philips saa7185 TV Encoder

- was introduced in 1996, is used in the BUZ
- can generate: PAL B/G, NTSC M

Brooktree bt856 TV Encoder

- was introduced in 1994, is used in the LML33
- can generate: PAL B/D/G/H/I/N, PAL M, NTSC M, PAL-N (Argentina)

Analog Devices adv7170 TV Encoder

- was introduced in 2000, is used in the LML300R10
- can generate: PAL B/D/G/H/I/N, PAL M, NTSC M, PAL 60

Analog Devices adv7175 TV Encoder

- was introduced in 1996, is used in the DC10, DC10+, DC10 old, DC30, DC30+
- can generate: PAL B/D/G/H/I/N, PAL M, NTSC M

ITT mse3000 TV encoder

- was introduced in 1991, is used in the DC10 old
- can generate: PAL, NTSC, SECAM

Conexant bt866 TV encoder

- is used in AVS6EYES, and
- can generate: NTSC/PAL, PALM, PALN

The adv717x, should be able to produce PAL N. But you find nothing PAL N specific in the registers. Seem that you have to reuse a other standard to generate PAL N, maybe it would work if you use the PAL M settings.
4.30.5 How do I get this damn thing to work

Load zr36067.o. If it can’t autodetect your card, use the card=X insmod option with X being the card number as given in the previous section. To have more than one card, use card=X1[,X2[,X3[,X4[..]]]]

To automate this, add the following to your /etc/modprobe.d/zoran.conf:

```
options zr36067 card=X1[,X2[,X3[,X4[..]]]] alias char-major-81-0 zr36067
```

One thing to keep in mind is that this doesn’t load zr36067.o itself yet. It just automates loading. If you start using xawtv, the device won’t load on some systems, since you’re trying to load modules as a user, which is not allowed (“permission denied”). A quick workaround is to add ‘Load "v4l"’ to XF86Config-4 when you use X by default, or to run ‘v4l-conf -c <device>’ in one of your startup scripts (normally rc.local) if you don’t use X. Both make sure that the modules are loaded on startup, under the root account.

4.30.6 What mainboard should I use (or why doesn’t my card work)

<insert lousy disclaimer here>. In short: good=SiS/Intel, bad=VIA.

Experience tells us that people with a Buz, on average, have more problems than users with a DC10+/LML33. Also, it tells us that people owning a VIA- based mainboard (ktXXX, MVP3) have more problems than users with a mainboard based on a different chipset. Here’s some notes from Andrew Stevens:

Here’s my experience of using LML33 and Buz on various motherboards:

- **VIA MVP3**
  - Forget it. Pointless. Doesn’t work.

- **Intel 430FX (Pentium 200)**
  - LML33 perfect, Buz tolerable (3 or 4 frames dropped per movie)

- **Intel 440BX (early stepping)**
  - LML33 tolerable. Buz starting to get annoying (6-10 frames/hour)

- **Intel 440BX (late stepping)**
  - Buz tolerable, LML3 almost perfect (occasional single frame drops)

- **SiS735**
  - LML33 perfect, Buz tolerable.

- **VIA KT133(*)**
  - LML33 starting to get annoying, Buz poor enough that I have up.

- Both 440BX boards were dual CPU versions.

Bernhard Praschinger later added:

- **AMD 751**
  - Buz perfect-tolerable

- **AMD 760**
  - Buz perfect-tolerable

In general, people on the user mailinglist won’t give you much of a chance if you have a VIA-based motherboard. They may be cheap, but sometimes, you’d rather want to spend some more money on better boards. In general, VIA mainboard’s IDE/PCI performance will also suck badly compared to others. You’ll noticed the DC10+/DC30+ aren’t mentioned anywhere in the overview. Basically, you can assume that if the Buz works, the LML33 will work too. If the LML33 works, the DC10+/DC30+ will work too. They’re most tolerant to different mainboard chipsets from all of the supported cards.

4.30. The Zoran driver
If you experience timeouts during capture, buy a better mainboard or lower the quality/buffersize during capture (see ‘Concerning buffer sizes, quality, output size etc.’). If it hangs, there's little we can do as of now. Check your IRQs and make sure the card has its own interrupts.

### 4.30.7 Programming interface

This driver conforms to video4linux2. Support for V4L1 and for the custom zoran ioctl's has been removed in kernel 2.6.38.

For programming example, please, look at lavrec.c and lavplay.c code in the MJPEG-tools ([http://mjpeg.sf.net/](http://mjpeg.sf.net/)).

Additional notes for software developers:

> The driver returns maxwidth and maxheight parameters according to the current TV standard (norm). Therefore, the software which communicates with the driver and “asks” for these parameters should first set the correct norm. Well, it seems logically correct: TV standard is “more constant” for current country than geometry settings of a variety of TV capture cards which may work in ITU or square pixel format.

### 4.30.8 Applications

Applications known to work with this driver:

- **TV viewing:**
  - xawtv
  - kwintv
  - probably any TV application that supports video4linux or video4linux2.

- **MJPEG capture/playback:**
  - mjpegtools/lavtools (or Linux Video Studio)
  - gstreamer
  - mplayer

- **General raw capture:**
  - xawtv
  - gstreamer
  - probably any application that supports video4linux or video4linux2

- **Video editing:**
  - Cinelerra
  - MainActor
  - mjpegtools (or Linux Video Studio)

### 4.30.9 Concerning buffer sizes, quality, output size etc.

The zr36060 can do 1:2 JPEG compression. This is really the theoretical maximum that the chipset can reach. The driver can, however, limit compression to a maximum (size) of 1:4. The reason for this is that some cards (e.g. Buz) can’t handle 1:2 compression without stopping capture after only a few minutes. With 1:4, it'll mostly work. If you have a Buz, use ‘low_bitrate=1’ to go into 1:4 max. compression mode.

100% JPEG quality is thus 1:2 compression in practice. So for a full PAL frame (size 720x576). The JPEG fields are stored in YUY2 format, so the size of the fields are 720x288x16/2 bits/field (2 fields/frame) =
207360 bytes/field \times 2 = 414720 \text{ bytes/frame} \text{ (add some more bytes for headers and DHT (huffman)/DQT (quantization) tables, and you’ll get to something like 512kB per frame for 1:2 compression. For 1:4 compression, you’d have frames of half this size.}

Some additional explanation by Martin Samuelsson, which also explains the importance of buffer sizes: –

> Hmm, I do not think it is really that way. With the current (downloaded > at 18:00 Monday) driver I get that output sizes for 10 sec: > -q 50 -b 128 : 24.283.332 Bytes > -q 50 -b 256 : 48.442.368 > -q 25 -b 128 : 24.655.992 > -q 25 -b 256 : 25.859.820

I woke up, and can’t go to sleep again. I’ll kill some time explaining why this doesn’t look strange to me.

Let’s do some math using a width of 704 pixels. I’m not sure whether the Buz actually use that number or not, but that’s not too important right now.

704x288 pixels, one field, is 202752 pixels. Divided by 64 pixels per block; 3168 blocks per field. Each pixel consist of two bytes; 128 bytes per block; 1024 bits per block. 100% in the new driver mean 1:2 compression; the maximum output becomes 512 bits per block. Actually 510, but 512 is simpler to use for calculations.

Let’s say that we specify d1q50. We thus want 256 bits per block; times 3168 becomes 81136 bytes; 101376 bytes per field. We’re talking raw bits and bytes here, so we don’t need to do any fancy corrections for bits-per-pixel or such things. 101376 bytes per field.

d1 video contains two fields per frame. Those sum up to 202752 bytes per frame, and one of those frames goes into each buffer.

But wait a second! -b128 gives 128kB buffers! It’s not possible to cram 202752 bytes of JPEG data into 128kB!

This is what the driver notice and automatically compensate for in your examples. Let’s do some math using this information:

128kB is 131072 bytes. In this buffer, we want to store two fields, which leaves 65536 bytes for each field. Using 3168 blocks per field, we get 20.68686868... available bytes per block; 165 bits. We can’t allow the request for 256 bits per block when there’s only 165 bits available! The -q50 option is silently overridden, and the -b128 option takes precedence, leaving us with the equivalence of -q32.

This gives us a data rate of 165 bits per block, which, times 3168, sums up to 65340 bytes per field, out of the allowed 65536. The current driver has another level of rate limiting; it won’t accept -q values that fill more than 6/8 of the specified buffers. (I’m not sure why. “Playing it safe” seem to be a safe bet. Personally, I think I would have lowered requested-bits-per-block by one, or something like that.) We can’t use 165 bits per block, but have to lower it again, to 6/8 of the available buffer space: We end up with 124 bits per block, the equivalence of -q24. With 128kB buffers, you can’t use greater than -q24 at -d1. (And PAL, and 704 pixels width...)

The third example is limited to -q24 through the same process. The second example, using very similar calculations, is limited to -q48. The only example that actually grab at the specified -q value is the last one, which is clearly visible, looking at the file size. –

Conclusion: the quality of the resulting movie depends on buffer size, quality, whether or not you use ‘low_bitrate=1’ as insmod option for the zr36060.c module to do 1:4 instead of 1:2 compression, etc.

If you experience timeouts, lowering the quality/buffersize or using ‘low_bitrate=1 as insmod option for zr36060.o might actually help, as is proven by the Buz.

### 4.30.10 It hangs/crashes/fails/whatevers! Help!

Make sure that the card has its own interrupts (see /proc/interrupts), check the output of dmesg at high verbosity (load zr36067.o with debug=2, load all other modules with debug=1). Check that your mainboard is favorable (see question 2) and if not, test the card in another computer. Also see the notes given in question 3 and try lowering quality/buffersize/capturesize if recording fails after a period of time.

If all this doesn’t help, give a clear description of the problem including detailed hardware information (memory+brand, mainboard+chipset+brand, which MJPEG card, processor, other PCI cards that might
be of interest), give the system PnP information (/proc/interrupts, /proc/dma, /proc/devices), and give the kernel version, driver version, glibc version, gcc version and any other information that might possibly be of interest. Also provide the dmesg output at high verbosity. See ‘Contacting’ on how to contact the developers.

4.30.11 Maintainers/Contacting

The driver is currently maintained by Laurent Pinchart and Ronald Bultje (<laurent.pinchart@skynet.be> and <rbultje@ronald.bitfreak.net>). For bug reports or questions, please contact the mailinglist instead of the developers individually. For user questions (i.e. bug reports or how-to questions), send an email to <mjpeg-users@lists.sf.net>, for developers (i.e. if you want to help programming), send an email to <mjpeg-developer@lists.sf.net>. See http://www.sf.net/projects/mjpeg/ for subscription information.

For bug reports, be sure to include all the information as described in the section ‘It hangs/crashes/fails/whatevers! Help!’ Please make sure you’re using the latest version (http://mjpeg.sf.net/driver-zoran/).

Previous maintainers/developers of this driver include Serguei Miridonov <mirsev@cicese.mx>, Wolfgang Scherr <scherr@net4you.net>, Dave Perks <dperks@ibm.net> and Rainer Johanni <Rainer@Johanni.de>.

4.30.12 Driver’s License

4.31 Zoran 364xx based USB webcam module

site: http://royale.zerezo.com/zr364xx/
mail: royale@zerezo.com

4.31.1 Introduction

This brings support under Linux for the Aiptek PocketDV 3300 in webcam mode. If you just want to get on your PC the pictures and movies on the camera, you should use the usb-storage module instead.

The driver works with several other cameras in webcam mode (see the list below).

Maybe this code can work for other JPEG/USB cams based on the Coach chips from Zoran?

Possible chipsets are: ZR36430 (ZR36430BGC) and maybe ZR36431, ZR36440, ZR36442...

You can try the experience changing the vendor/product ID values (look at the source code).

You can get these values by looking at /var/log/messages when you plug your camera, or by typing: cat /proc/bus/usb/devices.

If you manage to use your cam with this code, you can send me a mail (royale@zerezo.com) with the name of your cam and a patch if needed.
This is a beta release of the driver. Since version 0.70, this driver is only compatible with V4L2 API and 2.6.x kernels. If you need V4L1 or 2.4x kernels support, please use an older version, but the code is not maintained anymore. Good luck!

4.31.2 Install

In order to use this driver, you must compile it with your kernel.

Location: Device Drivers -> Multimedia devices -> Video For Linux -> Video Capture Adapters -> V4L USB devices

4.31.3 Usage

modprobe zr364xx debug=X mode=Y

- debug : set to 1 to enable verbose debug messages
- mode : 0 = 320x240, 1 = 160x120, 2 = 640x480

You can then use the camera with V4L2 compatible applications, for example Ekiga.

To capture a single image, try this: dd if=/dev/video0 of=test.jpg bs=1M count=1

4.31.4 links

http://mxhaard.free.fr/ (support for many others cams including some Aiptek PocketDV)  http://www.harmwal.nl/pccam880/ (this project also supports cameras based on this chipset)

4.31.5 Supported devices
